Pope Mfg. Co.—Pope-Hartford fire truck.  
Premier Motor Car Co. of New England—Premier.

Proctor Supply Co., G. H.—Mora.  
Rauch & Lang Carriage Co.—R. & L. electric.

Regal Motor Co.—Regal.  
Reliance Motor Truck Co.—Reliance commercial.

Russell & Co., W. L.—Apperson.  
S. M. Supplies Co., The—Inter-State.  
Sampson Mfg. Co., Alden—Sampson commercial.

Sanders, N. S. H.—Anderson and Chase commercial.

Schacht Mfg. Co.—Schacht.  
Selden Motor Car Co.—Selden.

Simplex New England Agency—Simplex.  
Smith, Fred S.—Autocar and Mercer.  
South End Motor Car Co.—Empire, and Hart-Kraft commercial.

Standard Motor Car Co.—Standard and Patterson.

Stanley Motor Carriage Co.—Stanley steam.

Stevens-Sowers Motor Car Co.—Fuller and Jackson, and Grabowsky commercial.

Studebaker Brothers Co., of New York—Studebaker gasolene and electric commercial.

Thomas Motor Co., E. R.—Thomas.  
Tyler, F. J.—Maxwell.

Underhill Co., The—Knox pleasure and commercial.  
Welch Motor Car Co., of New England—Welch.

White Co., The—White gasolene and steam, pleasure and commercial.  
White-Ware & Co.—Corbin.

Whitten-Gilmore Co., The—Chalmers and Hudson.  
Wing, F. E.—Marmon.  
Winton Motor Carriage Co.—Winton.

#### Motorcycles.

American Motor Co.—M-M.  
Aurora Automatic Machinery Co.—Thor.  
Consolidated Mfg. Co.—Yale.  
Crouch Motor Co.—Crouch.  
Emblem Mfg. Co.—Emblem.  
Excelsior Supply Co.—Excelsior.  
Hendee Mfg. Co.—Indian.  
Miami Cycle & Mfg. Co.—Miami and Race cycle bicycles.

Baldwin Chain & Mfg. Co.—Baldwin chains and recoil checks.  
Baldwin Mfg. Co.—Rotary map index.  
Batavia Rubber Co.—Batavia tires.  
Bi-Motor Equipment Co.—Accessories.  
Borne Scrymser Co.—Lubricants.  
Bosch Magneto Co.—Bosch magnetos.  
Boston Auto Gauge Co.—Triumph gasoline gauges.  
Boston Tire & Rubber Co.—Pneumatic and solid tires.  
Bowser & Co., S. F.—Gasoline and oil storage systems.  
Boyd, F. Shirley—Supplementary spiral springs.

Consolidated Rubber Tire Co.—Tires.  
Connecticut Telephone & Electric Co.—Connecticut coils and timers.  
Corlew-Coughlan Co.—Siro carburettors.  
Couch & Seeley Co.—Casgrain speed indicators.  
Coward, John D.—Ajax wind shields and Best traction chains.  
Craig Co., The David—Portable concrete garages.  
Cramp & Sons Ship & Engine Building Co., Wm.—Bronze castings and components.  
Crane Co., L. M.—Lubricants.  
Culver-Stearns Mfg. Co.—Lamp lighting attachments.

GLIMPSES OF THE ACCESSORY DISPLAY IN THE GALLERY OF EXHIBITION HALL

Merkel-Light Motor Co.—Merkel and Light.  
Pierce Cycle Co., The—Pierce.  
Reading Standard Co.—R-S.  
Reliance Motorcycle Co.—Reliance.

#### Accessories.

Aetna Life Insurance Co.—Insurance.  
Adams & Co., J. Q.—Books.  
Ajax-Grieb Rubber Co.—Ajax tires.  
Ajax Trunk and Sample Case Co.—Leather trunks and tire cases.  
American Ever Ready Co.—Ever-ready batteries, lamps and tire specialties.  
American Storage Battery Co.—Accumulators.  
Atlas Rubber Co.—Non-puncturable inner tubes.  
Atwater-Kent Mfg. Works—Timers and electric horns.  
Auburn Auto Pump Co.—Automatic tire inflating pumps.  
Austin & Doten—Shelby steel tubing.  
Auto Improvement Co.—Accessories and specialties.  
Auto Supplies Co.—Holyoke tire protector.  
Baker, Roy C.—Vacuum cleaners.

Brunner Mfg. Co.—Air compressors.  
Burn Boston Battery Co.—Sealed liquid batteries.  
Burroughs Remountable Rim Co.—Burroughs Remountable rims.  
Butts & Ordway—Tire vulcanizers.  
Chandler & Farquhar Co.—Machine tools and machinists supplies.  
Chase & Co., L. C.—Top and cover materials.  
Clayton Air Compressor Works—Clayton non-blowout tire valves.  
Cleveland Speed Indicator Co.—Speed indicators.  
Coes Wrench Co.—Coes wrenches.  
Coates Clipper Mfg. Co.—Flexible shafting.  
Colton Combination Tool Co.—Combination utensils.  
Columbia Lubricant Co., of New Jersey—Monogram oils.  
Columbia Tire & Top Co.—Tops, tire cases and covers.  
Connell, W. J.—E. & J. lamps, Elite jacks, and W. & S. magnetos and carburettors.  
Continental Caoutchouc Co.—Continental tires.  
Connecticut Oil Co.—Lubricants.

Daniels, W. S.—Kokomo ignition appliances, Globe tool and battery boxes and Kingston carburettors.  
Diamond Rubber Co., The—Diamond tires.  
Dixon Crucible Co., Joseph—Graphite lubricants.  
Dorian Remountable Rim Co.—Dorian remountable rims.  
Dover Stamping Mfg. Co.—Drip pans, funnels and measures.  
Duren & Kendall—Vacuum cleaners.  
Eagle Oil & Supply Co.—Lubricants.  
Eastman, W. E.—Compensating spring suspension.  
Eco Mfg. Co.—Acetylene generators and autogenous welding appliances.  
Eisner & Co., Harry—Fry spark plugs, Yankee whistles and mufflers.  
Electric Storage Battery Co.—Accumulators and lighting systems.  
Empire Tire Co.—Empire tires.  
Federal Rubber Co.—Tires.  
Fiat Repair Co.—Coventry chains and aluminum solder.  
Firestone Tire & Rubber Co.—Firestone tires.  
Fisk Rubber Co., The—Fisk tires.

Flentje, Ernst—Shock preventers.  
 Forbes, W. J.—K. W. Magneto.  
 Ford Co., Percy—Specialties.  
 Fox Metallic Tire Belt Co.—Non-skid chains.  
 G & J Tire Co.—G & J tires.  
 Gabriel Horn Mfg. Co.—Gabriel exhaust horns and Foster shock absorbers.  
 Gasoline Motor Efficiency Co.—Carburettor attachment.  
 Gilbert Mfg. Co.—Tire jackets, lamp jackets and rubber cloth specialties.  
 Goodrich Co., The B. F.—Goodrich tires.  
 Goodyear Tire & Rubber Co.—Goodyear tires.  
 Gray & Davis—Lamps.  
 H. I. K. Co.—Oil storage systems.  
 Harriman Engine Co.—Rotary steam and gas motors.  
 Harris Oil Co., A. W.—Lubricants.  
 Hart & Fuller—Gas lamp igniters.  
 Hartford Rubber Works Co.—Hartford tires.  
 Hartford Suspension Co.—Truffault-Hartford shock absorbers.  
 Harvey Co., Arthur C.—Metals.  
 Havoline Oil Co.—Lubricants.  
 Heinze Electric Co.—Ignition specialties.  
 Heriz & Co.—Magnetic ignition devices.  
 Hillman Auto Supply Co.—Brass and plated specialties.  
 Hilton Mfg. Co.—Safety crank.  
 Hoeffcker Co., The—Hoeffcker speed indicators.  
 Holt & Beebe—Electric lamps.  
 Hopewell Bros.—Tire casings.  
 Howard Demountable Rim Co.—Howard Demountable rims.  
 Hydraulic Oil Storage Co.—Gasolene storage systems.  
 Ideal Wind Shield Co.—Wind shields.  
 Iyer Johnson Sporting Goods Co.—Accessories.  
 Jones Speedometer Co.—Jones speedometers, taximeters and live maps.  
 Jordan, R. W.—Jordan demountable rim, K & T clocks and Remy magnetos.  
 Kellom & Co., C. F.—Lubricants.  
 Kemble, A. M.—Recometer.  
 Kempshall Tire Co.—Kempshall tires.  
 Kennedy Carburettor Co.—Kennedy carburetters.  
 Keystone Lubricants Co.—Lubricants.  
 Kilgore Mfg. Co.—Shock absorbers.  
 Knapp-Greenwood Co.—Shock absorbers and spark plugs.  
 Lavelette & Co.—Eisemann magnetos.  
 Leather Tire Goods Co.—Woodworth detachable tire treads.  
 Leland & Co., W. H.—Worcester spark coils and grinders.  
 Lovell-McConnell Mfg. Co.—Klaxon horns.  
 Lunt-Moss Co.—Stationary engines, accumulators and lighting systems.  
 Lyon Non-Skid Co.—Non-skid device.  
 Marburg, Theo. H.—Mea magneto.  
 Mezgar, Inc., C. A.—Soot-Proof spark plugs and automatic wind shields.  
 Michelin Tire Co.—Michelin tires.  
 Miller, Chas. E.—Brampton chains, accessories and supplies.  
 Moore-Smith Co.—Fur garments.  
 Morgan & Wright—M. & W. tires.  
 Motor Specialties Co.—Flash auto lighter.  
 Murray Co., P. A.—Tops.  
 Mutty Co., L. J.—Top and cover materials.  
 National Temperature Regulator Co.—Thermostatic furnace control.  
 New England Sales Co.—Phelps Trouble Finder.  
 New York & New Jersey Lubricant Co.—Non-fluid oils.  
 National Carbon Co.—Dry batteries.  
 Nightingale Whistle Co.—Exhaust whistles.

Noonan Tool & Machine Co.—Special tools and utensils.  
 Oakley Steel Foundry—Steel castings.  
 Panhard Oil—Lubricants.  
 Pantasote Co., The—Top and upholstery materials.  
 Parker Motor Co.—Parker motors and McCue axles.  
 Parker, G. L.—Player pianos.  
 Pennsylvania Rubber Co. of New York—Pennsylvania tires.  
 Perfection Wrench Co.—Wrenches.  
 Pittsburg Auto Equipment Co.—Union wind shields.  
 Pittsfield Spark Coil Co.—Ignition specialties.  
 Polson, W. F.—Wind shields.  
 Post & Lester Co.—Supplies.  
 Randall Faichney Co., The—Jericho exhaust horns, B-Line grease guns and Bing spark plugs.

Swinehart Tire & Rubber Co.—Swinehart tires.  
 Teel Mfg. Co.—Valveless motors.  
 U. S. Light & Heating Co.—National storage batteries.  
 Underhay Oil Co.—Lubricants.  
 Vacuum Oil Co.—Lubricants.  
 Valentine & Co.—Varnishes.  
 Veeder Mfg. Co.—Odometers and tachometers.  
 Victor Auto Supply Co.—Wind shields.  
 Victor Metals Co.—Motors.  
 Voorhees Rubber Co.—Tire repair outfits.  
 Ward & Sons, E. T.—Metals.  
 Warner Gear Co.—Gears and parts.  
 Warner Instrument Co.—Auto-Meters.  
 Weed Chain Tire Grip Co.—Weed chain tire grips.  
 Westinghouse Electric & Mfg. Co.—Electric vehicle charging outfits.

THE EXHIBIT OF BOSCH MAGNETOS

R. I. V. Bearings—Anti-friction bearings.  
 Ravello Chemical Co.—Beauty paste.  
 Reliance Speedometer Co.—Speed indicators.  
 Remy Electric Co.—Magnetos.  
 Republic Rubber Co.—Republic tires.  
 Robinson & Son Co., W. C.—Lubricants.  
 Russell & Co., T. W.—Accessories.  
 Rutherford Rubber Co.—Sterling tires.  
 Sage Trunk Co.—Trunks and suit cases.  
 Salmon & Co., John A.—Monograms.  
 Sawyer Oil Co., Howard B.—Lubricants.  
 Sectional Rubber Tire Co.—Sectional solid tires.  
 Seamless Rubber Co.—Bragg stitched tires.  
 Shawmut Tire Co.—Tires.  
 Sheldon Axle Co.—Axles.  
 Simmons, Hatch & Whitton Co.—Robes and gauntlets.  
 Sireno Co.—Sireno horns.  
 Smith Co., Wm. J.—Tools.  
 Spaulding Mfg. Co.—Lawn swings.  
 Splittorf, C. F.—Ignition appliances.  
 Stackpole Battery Co.—Dry batteries.  
 Standard Thermometer Co.—Standard speedometer.  
 Standard Tire & Rubber Co.—Federal tires.  
 Standard Welding Co.—Parts.  
 Star Auto Locks—Security devices.  
 Stein Double Cushion Tire Co.—Tires.  
 Sterling Hardware Co.—Potato mashers.  
 Stromberg Motor Devices Co.—Stromberg carburetters.  
 Suburban Concrete Block Co.—Garage material.

White & Bagley Co.—Lubricants.  
 Whitney Mfg. Co.—Whitney chains and keying systems.  
 Whittaker Chain Tread Co.—Non-skid appliances.  
 Wilkinson & Co., A. J.—Machinery and tools.  
 Y. M. C. A. Auto School—Demonstrating exhibit.

#### Boston Overflow Show a Sickly Venture.

Attempts to secure a sizeable aggregation as nucleus for an overflow show—so-called by the promoter, have not resulted altogether successfully for the project, which is making use of the discarded Museum of Fine Arts building in Boston this week. About a dozen exhibitors straggled in during the day Saturday, and up to noon of Monday, but for the most part, the band plays to empty echos in the lofty halls of the building. The cars represented by exhibits within and by large signs which are blazoned shamelessly on the outer walls of what once was considered Boston's most artistic structure, include the Lexington, Hupmobile, Whiting "20," Rainier and Parry pleasure cars, and the Manhattan trucks. Second-hand cars also are exhibited by one concern, while one special form of tire, a local make of speedometer, a dealer in lubricants and another in accessories close the list.

**CLEVELAND'S SECOND THIS YEAR**

**Central Armory Again Filled with Cars, at Automobile Club's Show—A Big List of Exhibitors.**

Following close on the heels of the dealers' annual exhibition, the eighth annual automobile show of the Cleveland Automobile Club, opened in Central Armory on the 5th inst., with the largest number of exhibitors ever enlisted for an affair of the sort in the Ohio city. Mayor Baehr pressed the button that set the thousands of lights aglow and officially ushered in the function which will run throughout the week. By dint of skillful planning Manager George Collister, who has had charge of all of the previous shows given by the club, found room for some 70 exhibitors of whom 40 stage cars, and the remainder display motorcycles and accessories.

Over 160 cars of 70 different brands are on the floor. There are a few firms who secured space in both shows, among them being the F. B. Stearns Co., the White Co., Studebaker Auto Co., and Applebaum Bros. While in previous years the main floor has been large enough to accommodate all cars, this year it was necessary to make requisition on part of the balcony for car exhibits, six firms being located in the elevated section.

Pure white setting transformed the armory into a scene which rivaled all previous decorative schemes. With the exception of the green burlap floor the color scheme was white throughout. Concealing the roof are 5,000 yards of duck, while triple that amount of bunting lines the walls and staircases. The railing of the balcony, which is one of the decorative features, is covered with plaster of paris staff work, bearing at intervals lion heads and automobile shields. Scattered around the main floor are a number of massive Corinthian columns, from which are strung streamers of electric lights. In the center of the hall, mounted on a pedestal and standing out resplendent in a flood of light, is an automobile girl, the emblem of the show. Suspended from the rafters are three immense clusters of lights representing automobile wheels, and sunbursts are placed at either end of the balcony, in addition to that on Collister's genial physiognomy.

Following are the exhibitors and their products:

Gasolene cars: Rambler Automobile Co., Rambler; Weddell House Garage, Inter-State and Holsman; Studebaker Auto Co., Studebaker; Brandt Motor Car Co., Kisselkar; Olds-Oakland Co., Oldsmobile and Oakland; Maxwell-Briscoe-Cleveland Co., Maxwell, Columbia and Grabowsky trucks; Charles B. Shanks Co., Chalmers and Hudson; Cook Motor Sales Co., Premier and Reo; Garford Motor Truck Co., Garford

trucks; Sebring Motor Car Co., Sebring; Crest Motor Car Co., Paige-Detroit, Abbott-Detroit and Warren-Detroit; Western Reserve Motor Car Co., Pierce-Arrow, Apperson, Everitt and Hewitt trucks; Auto Sales Co., Velie and Hupmobile; Euclid Auto Co., Firestone-Columbus, Atlas and Frayer-Miller trucks; Crawford Motor Co., Stearns, Jackson, Fuller and Rider-Lewis; Buick Motor Co., Buick, Welch-Pontiac and Welch-Detroit; Park Motor Car Co., Speedwell; H. S. White & Co., Pierce-Racine; Overland Motor Car Co., Overland and Marion; Regal Motor Sales Co., Regal; Barger Automobile Co., Cadillac; White Co., White; Mitchell Bros. Co., Ohio; Elmore Motor Car Co., Elmore; J. H. Greenwald, Marmon and Moon; Wentworth Motor Car Co., Mora; V. R. Hall Auto Co., Cartecar and Plymouth trucks; Lucas & Christenson, Mitchell; Pullman Motor Car Co., Pullman; Forest City Motor Car Co., Jewel; Gabriel Carriage & Wagon Co., Gabriel, Krit and International delivery wagons; Haynes Auto Agency, Haynes; Black & Co., Black-Crow; The Auto Shop Co., Thomas.

Steam cars: White Co., White.

Electric vehicles: Babcock Electric Garage & Sales Co., Babcock; Studebaker Auto Co., Studebaker; Bros Carriage & Wagon Co., Broc; Western Reserve Motor Car Co., Woods; Euclid Auto Co., Columbus; Applebaum Bros., Detroit.

Motorcycles: Akron Auto Supply Co., New Era; Lister Bicycle Co., Racycle, Harley-Davidson and Yale; Casino Cycle & Supply Co., Thor and Excelsior; L. J. Mueller, Indian, Merkel and Light; V. R. Hall Auto Co., M. M.; Jepson Bros., Curtiss and Marvel; Collister & Sayle, R. S.

Accessories: Hammer & Hull, Falls Rubber Co., Horsey Mfg. Co., Perfection Spring Co., Cleveland Chain & Mfg. Co., Miller Rubber Co., J. E. Streater, The Carburetter Co., Philpot Rubber Co., M. & M. Co., F. C. Pinyoun & Son, Wright Wrench Mfg. Co., Charles E. Miller, K. & W. Mfg. Co., Lakewood Chemical Co., B. & B. Mfg. Co., Pennsylvania Rubber & Supply Co., Stein Double Cushion Tire Co., Atlantic Refining Co., Starr Rubber Co., National Motor Supply Co., H. W. Johns-Manville Co., Collister & Sayle, Vesta Battery & Light Co., Booth Demountable Rim Co., Cleveland Y. M. C. A.

**Sebring Plays a Big Speed Limit.**

Arrests for speeding are likely to be far better in at least one town in this country, namely Sebring, Ohio. The law makers of that burg have passed an ordinance making it unlawful to pass through the town at a greater speed than 50 miles an hour. It is said they did not desire to see ordinances broken so frequently, as that would reflect upon the reverence in which the authority of the town council was held, and they therefore decided on the 50 miles limit, which most automobilists will find somewhat difficult to break.

**SMALLER CITIES HOLDING SHOWS**

**Albany, Dayton and Sioux City Give Their Maiden Efforts—Hornell in the Two-Year-Old Class.**

Since the close of the big national automobile shows in New York and Chicago the show circuit has been confined practically to the large cities throughout the country, which have vied with each other in the size and elegance of their annual exhibitions. Now that the major circuit has had its run, the minor cities are having their innings. Several of them are holding their maiden automobile shows this week.

Inaugurated on Tuesday, 1st inst., the first show ever held at Dayton, O., attracted a large list of exhibitors, over 50 makes of car in 105 different types being displayed in the Memorial building, where the show was held. Both floors of the large auditorium were filled with cars, motorcycles and accessories, which attracted large crowds on each of the five days of the exhibition. The stage at the further end of the hall also was given over to the display of cars, a flight of stairs leading from the main floor to the elevated platform.

That the setting of the cars on exhibition might be in keeping with the environment in which they are used, the outdoor plan of decorative embellishment was selected. Bay trees and evergreens were scattered around the hall, while white columns of staff were entwined with greenery. Topping the columns were clusters of shrubbery and streamers of evergreen were strung between the posts. Strings of electric lights were also trailed across the hall above the exhibits, forming a maze of illumination.

Among the cars on exhibition were the following:

Gasolene cars: Stoddard-Dayton, Courier, Lexington, Rapid, Buick, Peerless, Franklin, Reliance, Chalmers, Hudson, Cadillac, Pierce-Arrow, Thomas, Locomobile, Overland, Ford, Springfield, Reo, Hupmobile, Warren-Detroit, Elmore, Pilot, Metz, Regal, Mitchell, Frayer-Miller, E-M-F., Flanders, Garford, Brush, Maxwell, Jackson, White, Inter-State, Oakland, Empire, Apperson, Herreshoff.

Electric vehicles: Detroit, Babcock, Baker, Columbus, Rauch & Lang.

Motorcycles: Racycle, Thor, Harley-Davidson, Merkel, Indian, New Era, Greyhound, Yale and Excelsior.

To the thriving Sioux City (Ia.) Automobile Club belongs the honor of promoting the first automobile show ever held in the Gumbo State, which was staged in the Auditorium, from the 1st to the 5th inst., inclusive, with 60 exhibitors showing 35 leading American cars and a large complement of accessories. It represented the culmination of four years of effort on the part

of the club to promote a show, and the recent exhibition largely was due to the hearty co-operation of the local dealers. All available space was taken and several of the unlucky applicants held private shows in their salesrooms.

Before deciding on a decorative scheme the committee visited the Chicago show, and then determined on an outdoor setting. A scenic artist was commissioned to arrange the decorations, and the result of his efforts transformed the large hall into a brilliant assemblage of scenic effects depicting outdoor life. Around the walls were hung canvas painted to represent Nature in springtime, and above all stretched a field of blue, emblematic of the heavens. Bunting and fleur-de-lis were used in profusion to clothe the balconies, while the effect was heightened by rows of big red roses hung from strings of green foliage. For lighting over 1,000 electric lamps were employed, and potted plants and flowers scattered among the booths added to the beauty of the scene.

Gasolene cars: Inter-State Auto & Supply Co., Reo; Wyckoff-Cord Auto Co., Cadillac and Stevens-Duryea; Hanson & Tyler Automobile Co., Overland; Dealy Bros., Jackson; William Warnock Co., Ford and Rambler; Adams & McClusky Auto Co., Cartercar and Lambert; International Harvester Co., International; H. A. Wetmore, Chalmers and Hudson; Pioneer Motor Car Co., Studebaker, E-M-F., Flanders, Apperson and Mitchell; Sachse-Bunn Co., Firestone-Columbus; Pendleton Auto & Machine Co., Hupmobile and Inter-State; Bennett Auto Supply Co., Buick, Knox, White and Velie.

Electric vehicles: Sachse-Bunn Co., Columbus.

Motorcycles: J. H. Hamilton, Thor and Racyle.

Situated at the gateway to one of the most picturesque and beautiful touring regions in the East, it seems strange that Albany, N. Y., the capital of the Empire State, and on a main touring route, never has had an automobile show until this year. That smaller and less prominent cities in the vicinity no longer will be able to pride themselves on being more progressive than the capital city in the matter of automobile show promotion is due to the patriotic and civic pride manifested by the Tenth Regiment of Albany, which has come to the rescue and promoted the first automobile show the city has had, and which is being held in the armory this week.

Co-operating with the military men are the local dealers and the Albany Automobile Club, and the auspicious opening on Monday evening, 7th inst., augurs well for the success of the initial exhibition. Not only is every local member of the trade represented, but exhibitors also are recruited from Troy, Schenectady and nearby towns. All told there are over 50 exhibitors, who stage

over 250 different cars, of some 53 different brands.

In keeping with the patriotic sentiments of the show sponsors, the national colors predominate in the decorations. From every girder in the big drill shed large American flags hang; the walls are draped in similar dress, intermingling with white and yellow, the automobile club colors. Several wagon loads of potted plants, ferns, trees and shrubbery lend an outdoor effect, while thousands of electric lamps stud the ceiling and walls and are scattered among the booths. Through the center of the hall is placed a fence of flags and flowers dividing the room into two sections, while aisles flanked on either side by potted plants extend around the hall near the side walls, the exhibits in the center of the floor being placed back to back. Following are the exhibitors:

Gasolene cars: Albany Garage Co., Peerless, Simplex, Studebaker, Palmer-Singer, Apperson, E-M-F. and Flanders; Albany Motor Car Co., Cadillac and Thomas; Albany Rubber Tire Co., Selden; Buick Motor Co., Buick, Welch-Pontiac and Welch-Detroit; Central Automobile Co., Knox; Thomas L. Davis & Co., Jenkins; William Daye, Matheson; Eureka Motor Car Co., Cutting; Franklin Auto Co., Franklin; James Goold Co., Marmon; J. A. P. Ketchum, Packard; Maxwell-Briscoe Co., Columbia and Maxwell; Mohawk Valley Auto Co., Oldsmobile and Oakland; Park Garage Co., Mitchell, Speedwell, Chadwick and Frayer-Miller; Patten & Almy, Cameron; C. S. Ransom, Lozier, Stevens-Duryea and Mercer; Roy M. Robinson, Reo and Rainier; William L. Schupp & Sons, Marion, Overland and Rapid trucks; Snyder Auto Bazaar, Velie and Stearns; Troy & Albany Auto Exchange, Pierce-Arrow, Chalmers and Hudson; Troy Auto Improvement Co., Hupmobile and Koehler; Taylor Automobile Co., Locomobile; George W. Wait, Elmore; C. F. Weeber Mfg. Works, Ford and Haynes; J. B. Wilbur, Croxton-Keeton and Regal; Wright-Rye Motor Co., White, Jackson, Rambler and Atlas; B. A. Burtiss, American; Lansing & Morrison, Gramm-Logan trucks; Peter Murray, Inter-State.

Motorcycles: G. A. Feltman, Emblem and R. S.

Accessories: Albany Hardware & Iron Co., B. A. Burtiss, Cox Brass Mfg. Co., John Kingsbury, Steefel Bros., Walter Chain Mat Co., James Goold Co.

Overshadowing in importance all other local amusement functions which were unfortunate enough to conflict with it during its reign, the second annual automobile show of the Hornell (N. Y.) Automobile Club was held in Seneca Rink, on the 2nd and 4th inclusive, and proved the most successful ever held in that section. Numbered among the exhibitors were dealers from Buffalo and other nearby points, over 40 cars being on exhibition, as well as a wide assortment of accessories, the building

being taxed to capacity. One of the features of the exhibition was a Curtiss aeroplane, which divided attention with the inventor himself. Red, white and blue bunting constituted the decorations, while the ceiling was studded with hundreds of electric lamps. The proceeds of the show will be devoted to road improvement and sign-board erection in the vicinity of the club.

#### Philadelphia Readjusts Liability Rates.

At a meeting of the Philadelphia local committee on automobile liability insurance, held in that city last week, the rates for the automobile liability hazard were fully discussed and it was decided to readjust them upon the following basis:

Policy limits, \$5,000 death or accident one person; \$10,000 any one accident.  
Motor bicycles designed to carry but one person, and electric vehicles of any horsepower ..... \$25.00  
Gasolene or steam pleasure vehicles—  
Not over 16 h.p. .... 30.00  
17 to 37 h.p., additional ..... 2.00  
38 h.p. and upward, additional ..... 1.00

These rates are effective as to new business and renewals beginning on March 1st. The collision rates and property damage liability rates remain as originally adopted.

#### Utility Car for Suez Canal Use.

Combining a fire engine, sprinkler, and power pump, several new automobiles built by the Lorraine-Dietrich company of France for the Suez Canal company, represent an achievement of which the French company can be proud. The cars are of 25-40 horsepower, furnished with a pumping apparatus capable of drawing 60 cubic feet of water from a well 20 feet deep, in three minutes. Supplied with water pipes and hose lines, they can throw a stream of water 40 feet high, or to a distance of 70 feet. They are to be chiefly used to sprinkle the sandy and dusty streets of Port Said and Suez, as well as along the route of the canal, their equipment as fire engines and power pumps being intended for emergency use only.

#### London Leads the European Cities.

London has almost but not quite twice as many motor propelled vehicles as Berlin, Paris and Vienna combined. The numbers registered in these four cities are as follows:

London—Private cars, 23,560; public motor vehicles, 4,790.

Paris—Private cars, 7,124; public, 3,600.

Berlin—Private cars, 2,800; public, 136.

Vienna—Private cars, 2,100; public, 142.

#### Diplomats Must Buy Tags, Too.

Ambassadors and other members of the diplomatic staffs of foreign nations at the capital are exempt from taxation on real or personal property, but according to the ruling made recently by the commissioners of the District of Columbia they must pay \$2 for an identification tag for their automobiles. They still remain exempt from speed regulations, however.

## TWO NOVEL AUTOMOBILE SLEIGHS

**They Make Their Appearance at a Special Meet for Such Vehicles—One a Converted Touring Car.**

Motor sleighs have been proposed and talked about far in excess of their actual production, but with a view to gathering as large a group as possible at one time the Touring Club of France not long ago

ance, as revealed in the picture. A 10 horsepower Anzani motor constituted the power equipment, and to avoid the use of anything but sliding contact with the road surface the aerial propeller was employed. A foot actuated brake, to dig into the road in case of emergency, may be seen underneath the center of the body. The whole outfit weighed only 440 pounds, but it was only under favorable conditions that it could attain a satisfactory rate of travel.

In this connection it will be remembered

HILGERT MOTOR SLEIGH, WITH ARIEL PROPELLER

held a motor sleigh race meet at Gerardmer, in the Vosges, France, where vehicles of this class were entered in competition and were given the opportunity of demonstrating what they could do. At least two novel methods of propulsion were disclosed by the meet, one of them employing aerial drive and the other an ingenious form of tractor wheel.

Taking a regular touring car, M. J. de la Basse substituted runners for the four wheels, as shown in the accompanying illustration, and mounted a helically grooved drum between the forward and back sets. This drum, driven from the jackshaft by means of chains, served as the tractor, and the pressure of its contact with the road surface was made adjustable. The roller could even be raised entirely out of contact when desired, as for coasting. So readily could the changes be made which would convert the vehicle from a wheeled vehicle to a sleigh that M. Basse drove it from Paris to Annecy by road and then used it as a sleigh around the Annecy district before proceeding to Gerardmer. The 20 horsepower motor equipment was found ample for driving it over the snow at good speed, no changes being necessary in the engine mechanism or the steering gear. Unfortunately the machine suffered a bad collision with a horsedrawn sleigh shortly before the time for the races, and it was damaged to an extent that made it unfit for competition.

More highly specialized in its type, the light fan-driven production of M. Hilgert attracted no little attention by reason of its odd construction and peculiar appear-

ance, as revealed in the picture. A 10 horsepower Anzani motor constituted the power equipment, and to avoid the use of anything but sliding contact with the road surface the aerial propeller was employed. A foot actuated brake, to dig into the road in case of emergency, may be seen underneath the center of the body. The whole outfit weighed only 440 pounds, but it was only under favorable conditions that it could attain a satisfactory rate of travel.

In this connection it will be remembered

BASSE TOURING CAR TRANSFORMED INTO A SLEIGH

and reasonably level snow-covered roads the sleighs have done fairly well, though their adaptability to Arctic travel with its ice hummocks is as yet somewhat problematical.

### Motor Cars Aid French Cookery.

French soldiers have made a new discovery. They found that the hot water in the radiators of motor cars is just the thing in which to boil eggs.

## WINTER TEST FOR ARMY TRUCKS

**German Military Authorities Try Motor Vehicles in Harl Mountain Snow—Non-Skid and Snow Plow Experiment**

To further prove their value for military purposes, the army motor trucks, passenger automobiles and motorcycles attached to the garrison of Schoeneberg-Berlin, Germany, recently were subjected to a rigorous mid-winter test through the Harz mountains, the demonstration lasting four days.

The roads were covered with snow averaging two feet in depth; tree trunks were lying criss-cross everywhere and the cars had to climb over them; yet all the motor cars finished the hard test in good condition, while the motor bicycles were ordered back after the first 15 miles had been covered. The little machines were not quite capable of coping with the snow drifts and deep mud of the forest paths, and had to withdraw in favor of the small class of automobiles.

The test was arranged by the army department in order to decide once for all, whether or not the motorcycle was capable of beating the small motor car in reconnaissance service on bad roads, and the result was the sweeping victory of the motor car.

Four makes of motor trucks took part: Duerkopp, Nacke, N. A. G., and Dixi; the

latter was compelled to pull, in addition to its regular trailer, an electric repair wagon. Two powerful passenger cars, a Benz limousine, and Adler landaulet, accompanied this division of the "train."

The second division was made up of the "light cavalry" and consisted of ten small motor cars, the Adler, Benz, Dixi, Gaggenau, Hansa, Lloyd, Nacke, Oryx, Opel and Podelus, and six motorcycles furnished by the "Schnellfahrer" union of Germany.

On the first day, February 8th, heavy fog greatly hindered the work, while late in the afternoon of this day a snowfall, accompanied by strong wind, set in, making conditions about as hard as it would be possible to imagine them. The steep grade toward Auerhahn was surmounted by all the cars, but the motorcycles kept floundering around in the deep snow until it became clear to everyone that such a trip was not suited for them, and they were ordered home. Some humorously inclined youngsters who had gotten wind of the proposed trip, during the early morning of that first day built a ten-foot snow wall clear across the road at one of the most dangerous turns, and it took the combined efforts of the 54 soldiers in the "caravan" to remove the obstacle. The Dixi car at about the same time, found the snow very soft and nice to settle down in, and disappeared to a depth of three feet. It took one of the powerful passenger cars and four of the smaller ones to pull the doubly loaded Dixi out of the hole. At the top of the hill the snow was found to be fresh and soft, and permitted a test of a new plow invented by an army officer and adapted to automobile traction. The plow was affixed to the N. A. G. car, but somehow or other it did not work satisfactorily, as the snow on the down-grade was packed hard and resisted all the efforts of the plow. Where loose snow only barred progress, the plow proved very effective, and other tests are soon to be arranged with a view of proving exactly what it can do. Reaching Zellerfeld, quarters were obtained for the soldiers, while the cars were left on the street. This proved injudicious, for during the heavy snowfall and frost of the night the wheels froze fast to the ground and it took hard work to pry them loose.

The next morning, one of the trucks, the Duerkopp, was sent up a long hill with an incline of 1:6, carrying a load of 4,000 kilograms (8,800 pounds), and succeeded with the help of the sand boxes in reaching the top without assistance from any of the cars. The whole caravan then proceeded to Harzburg.

On the third day the ten small automobiles made a fast trip of 80 kilometers, through the worst snow drifts and over ice-covered roads which no horse-drawn vehicles could have passed, reaching their goal without mishaps of any kind.

On the last day an attempt was made to climb the Brocken, the highest point of the Harz mountains, but a short distance from the summit a high snowdrift, nearly 50 feet thick and 10 feet high, barred further progress.

During this hard trip it was found that the best results against skidding were obtained by fitting the rear wheels with short cross chains fastened to hooks between the spokes, while the front wheels gave the best service when the cross chains were fastened diagonally. After the official part of the journey was accomplished an attempt was

made by the driver of the Buessing truck to conquer the hill, which previously had been surmounted by the Duerkopp car. He loaded the truck with 4,000 kilograms, attached the trailer, loaded with 2,000 kilograms, and drove the entire length of the hill without even using the sand boxes.

The official report made to the War Department regarding these trials says that not only did the trucks fulfill all requirements, but that they far exceeded them, and recommended an increase in the appropriation for the purchase of more automobile trucks for army service.

#### Corset Cup Replaces Whiskey Trophy.

Racing for a corset cup this year is to take the place of the competitions on the

Florida beach which in the past have been run for the Dewar whiskey trophy. The speed carnival of the Florida East Coast Automobile Association, which will be held March 22 to 25, on the Daytona beach, will introduce the initial race for a new prize, known as the W. B. Five Thousand Dollar Trophy, and which must be won twice in succession for permanent possession. It is offered in the 300 miles free-for-all, and is presented by the W. B. Corset Co., of New York City. As disclosed in the accompanying illustration, it is a Greek urn, surmounted by Victory with a laurel wreath. It is made of solid silver and stands nearly five feet in height, and is claimed to represent a value of \$5,000.

#### Big "Down East" Tour in Prospect.

Owners of E-M-F. cars residing in New York City and vicinity will have no occasion to pore over maps and road books in an effort to lay out a vacation tour for the coming summer, for George C. John, the metropolitan agent, is planning a monster outing through New England, which will

include the White Mountains and the Rangeley Lake region in Maine, and which will be open to owners of E-M-F. cars exclusively. It is probable that the tour will not be confined to New York City owners, but that New England, Pennsylvania and New Jersey E-M-F. enthusiasts also will be invited to participate. According to present plans, the tour probably will last a fortnight, a week being spent in the lake and mountain districts, respectively. An elaborate program of entertainment will be provided each day, and tourists who wish to make side trips will not be confined to a strict observance of the program that will be arranged.

#### De Palma and Oldfield Matched at Last.

After much backing and filling and "publicity stunts" on the part of the rival firms involved, the long standing controversy between Ralph De Palma and Barney Oldfield as to whether the former's monster Fiat or the big Benz with which Oldfield has been barnstorming in the South is the faster, bids fair to be settled on Tuesday next, 15th inst., on the beach at Daytona, Fla. The terms of the match finally have been agreed upon and both drivers and their cars now are on the ground practicing for the speed duel. There is no prize offered for the match, which was arranged to decide the superiority of the two cars and as there is no love lost between the drivers it promises to be a bitter struggle for supremacy. Both cars are rated in the neighborhood of 200 horsepower. The distances for the match, which will be run in heats, have not been decided on yet, but all will be at short distances, probably between one and ten miles.

#### Florida Joins the National Association.

With the admission to membership in the American Automobile Association last week of the Florida State Automobile Association, which comprises eight federated clubs, the total of affiliated state bodies in the national organization was raised to 34. The election also of the Savannah (Ga.) Automobile Club presages the formation soon of a state association in the Peachtree State, as the admission of the sponsors of the Grand Prize race completed the requisite number of clubs necessary to form a state body, and steps to that end already have been taken. An indication of the herculean efforts which the present administration of the A. A. A. proposes to exert to build up the organization during the coming year is apparent from the expressed aim to increase the number of state associations to 40 with a total of 40,000 members.

#### Cortland Club Chooses New Officers.

At the annual meeting of the Cortland (N. Y.) Automobile Club, officers for the coming year were elected, as follows: A. F. Stilson, president; M. A. Chase, vice-president; F. C. Parsons, secretary, and F. A. Wilkins, treasurer.

**NEBRASKANS BUILT LITTLEST CAR**

**Took Two Years to Do It, but It is Perfect in All Details—Proves that It Will Work, Too.**

While Dr. Brandow, of Pittsfield, Mass., several years ago fashioned a motor car of lilliputian proportions, and other men since have built toy cars for children's use, it is safe to say that in design and in completeness of detail there never was one that compared with the miniature E-M-F. "30" touring car made by Swanson Bros., of Stromberg, Neb., who spent two years in its construction, and which recently was shown

THE LITTLEST CAR CONTRASTED WITH A FULL GROWN ONE

in operation on Michigan avenue, Chicago. Every part of the car, including even the technical details of the engine are perfect.

C. E. Swanson, the elder brother of the firm, values the car at \$5,000, and says he is doubtful if he would sell it at that price. This marvelous little creation, weighing only 156 pounds, was designed and built exactly like the large E-M-F. touring car, which weighs 2,160 pounds. The first thing done was the designing on blue prints, then patterns for all casting work were made and sent to Lincoln, Neb., where the castings were made.

The first part finished was the engine. This was a long and tedious job on account of its being so tiny. The cylinders, pistons and piston rings are ground to a perfectly smooth surface, and are very closely fitted. The crank shaft is turned out from a solid bar of steel. Water jackets are made from brass tubings, with a brass disc pressed into one end, forming the head, the jackets are fitted over the cylinders, and the valve cases are screwed into the cylinder heads, pressing the jackets down against the cylinder castings and making all joints water

tight. The differential gear is of the spur gear type, and the gears are made from brass pinion wire, as are also the gears in the transmission. The lamps are made from sheet brass, a form for which had to be made to spin the brass, in fact throughout the whole work a lot of special tools had to be made.

The detailed specifications of the little car which is shown by the accompanying illustration, are most interesting, viz.: Motor, four cylinders, cast separate,  $1\frac{1}{2}$  inch bore by  $1\frac{1}{2}$  inch stroke. Power, about  $\frac{1}{2}$  horsepower. Cooling, water, thermo-syphon. Ignition, current supplied by batteries, single unit, non-vibrating coil, high tension distributor. Lubrication, splash system. Carburetter, float feed type. Clutch, cone,

metal to metal. Transmission, sliding gear, progressive type, two speeds, forward and reverse. Drive, direct shaft drive in housing to bevel gear on rear axle, one universal joint. Axles, live rear axle running on anti-friction bearings, front axle tubular. Brakes, direct on wheels. Internal expanding metal rings. Steering gear, worm and gear type. Frame, angle steel. Wheels, wood artillery type. Wheel base, 44 inches. Tread, 24 inches. Tires, 15 by  $1\frac{1}{2}$  inches. Springs, semi-elliptic, front, rear full elliptic. Control, spark and throttle levers on steering wheel; clutch operated by a foot pedal; brake operated by a foot pedal; speed changed by hand lever. Finish of body, pure white with blue striping. Weight, 156 pounds. Value, \$5,000.

Motorists of Williamson, N. Y., have formed an automobile club, with the following officers: Richard M. Cheetham, president; Dr. E. H. Lapp, vice-president; Frank S. Wilder, treasurer; K. M. Davies, Wellington B. Freer and Ray W. Teats, governors. The organization starts with 28 names on the roll.

**AMATEUR TEAM CONTEST IN SIGHT**

**Crescent Athletic Club Issues Challenge and Pardington Provides a Trophy—Sport of Right Sort.**

The Crescent Athletic Club, of Brooklyn, N. Y., one of the most prominent and influential organizations in that city, which numbers among its members many enthusiastic motorists, has organized an automobile committee consisting of the following members: H. C. Martin, chairman; A. R. Pardington, George E. Brower, Foster Crompton and W. T. Wintringham. The committee's "sporting blood" being thus aroused, the club has challenged the Long Island Automobile Club of Brooklyn, to a team reliability contest to occur on Long Island in the spring. It will be an amateur contest of the right sort.

To lend interest to the affair A. R. Pardington, who is a member of both clubs, as also are several of his associates on the committee, has offered a challenge trophy for the contest. Mr. Pardington is well known in motoring circles, particularly as chairman of two Vanderbilt Cup race committees and manager of the Long Island Motor Parkway. The contest the details of which will be arranged later, will be held under A. A. A. contest rules and provides for teams not to exceed 12 members each. Cars are to be driven by members only, chauffeurs being barred.

**Foreign Courtesies for Chicago Clubmen**

Negotiations between the Chicago Automobile Club and various foreign clubs in reference to an exchange of courtesies between them, have just been brought to a satisfactory conclusion. Henceforth traveling members of the Chicago Automobile Club will have all the courtesies of the Royal Auto Club of Great Britain, the Automobile Club of France, and the Automobile Club of America. Chicago membership cards will open the doors of any one of the three club houses of the organizations mentioned, and numerous privileges enjoyed by members of these clubs will henceforth be at the service of motorists belonging to the Chicago club.

**Rex at Head of Norristown Club.**

Officers for the ensuing year were elected by the Norristown (Pa.) Automobile Club last week, as follows: John H. Rex, president; E. C. Meier, vice-president; William B. Hart, secretary; E. C. Wentz, treasurer; directors, E. C. Wentz, Robert A. Jackson, Harry C. Carney and George M. Black. A resolution was passed creating a class of associate membership, to which will be eligible members in good standing in other similar organizations which extend reciprocal privileges to members of the local club.

## THE MAIL BAG

### Duryea Takes Issue with Prof. Sharp.

Editor of the Motor World:

The action of the "spinning" wheel mentioned by Mr. Sharp on page 569 of the Motor World neglects to take into consideration the action of the balance gear with which most automobiles are provided.

Most everyone has noticed that if one wheel is free to spin and the other held, the one will go at double speed and the other stand still. This action begins as soon as a wheel bounces clear off the ground. The entire acceleration of the engine goes into one wheel. The vehicle simply coasts and the wheel still on the ground loses speed slightly under this coasting action. This means that the tire of the spinning wheel has much greater certainty of damage after one wheel is off the ground than if both are off.

Large wheels do much to overcome the bouncing, for the wheel rolls over the obstacle rather than against it.

But the best and most effective remedy is to do away with the balance gear. This device is so well known and in such universal use that many think an automobile cannot be successful without it. It has for years seemed to be one thing that had reached a final form. But the increased use of friction drives with provision for driving each wheel separately has opened a new way. The roller drive used by me on my Buggyauts for the last two or three years is a sort of friction drive and has been provided with a device for releasing the rollers on the inner wheel during a turn. At all other times each wheel is driven independently of the other. If one bounces into the air, the other propels the vehicle and prevents acceleration of the other wheel. It therefore comes down with proper speed and takes up the propulsion where it left it, with no damage to the tire and no slipping. The times when both wheels are off the ground together are few in comparison with the times when one or the other is in the air.

I have been surprised at the difference noticeable when driving a Buggyaut over a cobble street as compared with a rig having smaller wheels and a balance gear. The rig with the usual balance gear seemed to slow up as though the brakes had been applied to it.

CHARLES E. DURYEA,  
Reading, Pa.

[In Mr. Sharp's discussion of the problems involved in motor vehicle suspension systems, which was published in the issue of February 24th ult., attention was centered on the rate of movement toward and away from the ground when the wheel of a moving vehicle encounters an obstacle. As the object was to secure an illustration of

the conditions existing in the suspension under such circumstances, no attempt was made to trace out the mechanical effects resulting in the driving mechanism. The above criticism is especially pertinent because, as is intimated, the status of the differential driving mechanism long has been considered as settled, whereas it is one of many compromises about the car which occasional discussion may tend to improve.]

### Bretz Defends Ball Bearing Principle.

Editor of the Motor World:

In your issue of last week, we noticed a brief resume of a lecture on automobile bearings, delivered by Mr. W. L. Batt, for the New York School of Automobile Engineering; but we take decided exceptions to that part of Mr. Batt's talk, in which he says:

"The number of balls that can be gotten into these grooves is limited to about half of the total circumference, unless it is decided to cut the so-called filling slot, as is sometimes done. In such a case, the continuity of the running surface for the balls is broken, and the advantage of more balls is more than lost by the weakened race construction."

Now, let us see how true this statement of Mr. Batt's is. In this country, over fifty well-known makes of cars use the F. & S. annular ball bearings with this side filling slot, and in Europe, nearly one hundred of the great foreign makers have for years used this type exclusively. In construction, the F. & S. ball bearings are made with diagonal side entering slots, slightly smaller than the sizes of the balls themselves. The balls are, therefore, sprung in under greater pressure than they ever receive in service, the races yielding sufficiently to let them enter. Once in, the balls never again touch the side slots, which thus virtually no longer exist; thus disproving Mr. Batt's statement.

In the latest type of F. & S. bearing, with the frictionless metal split ring separator, the entire race is filled with balls, less only one ball for the aggregate thickness of the separator walls. This admits of a far greater number of balls, and balls of a bigger diameter. The bearings with the divided hole ring separator, withstand, therefore, a higher radial load, and in consequence also a higher thrust load; and where other makes of bearings have proved inadequate to the service imposed, notably in crankshaft construction, F. & S. bearings have frequently been substituted with satisfactory results; because they differ from all others in having a higher load carrying capacity, and greater endurance, due to the larger number of balls contained in a bearing, yet the construction is such that the destructive wear on the balls in the "full type" bearing is eliminated. The balls traveling on a continuous unbroken path, and for this reason, for equal loads, F. & S. annular ball bearings are the most durable in the world, and for equal size, F. & S. annular ball

bearings have the greatest load capacity.

Now, as to practical results. The Stearns is a noted hill-climber. The Lozier has made a number of twenty-four hour track records, and won the cup in its class, in the One-Gallon Efficiency Test last spring, due, as its makers well say, to its ball bearing efficiency.

The Benz racing cars, the holders of all the world's racing records, are fitted with F. & S. ball bearings, and the Napier, the great English car, made the wonderful twenty-four hour record, in the hands of S. F. Edge, on the Brooklands track, also using F. & S. bearings; and in the struggle for possession of the Atlanta trophy last fall, at Atlanta, won by the Rainier car, Louis Disbrow driving, the Rainier car fitted with F. & S. ball bearings was the only car that finished the race, and, as a matter of fact, was the only car that did not have to stop during the race on account of mechanical trouble, and in this race the Rainier car averaged over 70 miles an hour.

We might go on and mention innumerable other records, but these are the best known ones, and we think we have produced enough evidence to show that Mr. Batt is mistaken when he says that "The advantage of using more balls through a filling slot is lost by the weakened race construction," and which we are glad to say is only a bugaboo that exists in Mr. Batt's mind, possibly because he is engaged in selling another ball bearing, which does not use this good method of the F. & S.

As a matter of fact, like all other makers of guaranteed ball bearings, we receive from time to time some few of them for repair or replacement, caused by various uses, but never because of "weakened race construction," the design of the F. & S. annular ball bearing being such that in its construction enough metal, and of the right kind, is used, so that the ball race is really the strongest part of the whole bearing, supported as it is against strains by the housing and the shaft on which it revolves, or vice versa.

Other makes of ball bearings, however, evidently appreciate the F. & S. side filling slot system, by their imitations of it, and which imitations and infringements we are busy looking after in the United States and European courts, because they infringe on our fundamental patents.

Very truly yours,

J. S. BRETZ CO.,

Alex. Schwalbach, Advertising Mgr.

### Rich Prize for the Hardest Hitter.

For many years past it has been the custom in nearly all the baseball leagues to give articles of merchandise to members of the home teams making home runs at their own fields, but now there is a really valuable prize to be given to the best batsman in the two major leagues. The Chalmers Motor Co., of Detroit, Mich., this year will present one of its high priced cars to the baseball player making the greatest percentage of hits, as shown by the official batting record.

THE new Rambler, because of its quiet ease of motion, reserve power, and dignity of comfort, affords to the busy man pleasing relaxation and healthful recreation with family or friends at the end of the day. For satisfactory operation in crowded city traffic, on boulevard, or country road the new Rambler, because of the offset crank-shaft, is capable of three or sixty miles an hour, on high speed, climbing any hill with gratifying ease. The Spare Wheel obviates tire trouble. With straight-line drive, big wheels and tires, and new expanding clutch the new Rambler is superior to all in efficiency and better than any in quality, silence, and comfort.

Rambler automobiles, \$1,800 to \$2,500

Thomas B. Jeffery & Company

Branches: Chicago, Milwaukee, Boston, Cleveland and San Francisco

## RECENT PATENTS.

943,227. Automatic Safety Device. Otto Karcher, Canton, Ohio. Filed May 25, 1909. Serial No. 498,350.

1. An automatic safety device comprising rear wheels provided with brakes, driving means for said rear wheels, means for discontinuing the operation of said driving means, adjustable front wheels, means for controlling the adjustment of said front wheels, a safety clutch provided with operative connections with said brakes and with said means for discontinuing the operation of said driving means, said safety clutch being adapted to be operated by said front wheels when said wheels are not controlled by said controlling means.

943,240. Automobile Gear. Henry P. Dodge and Cassius M. Foster, Toledo, O. Filed March 29, 1909. Serial No. 486,366.

1. An automobile gear comprising a motor, a rear axle, driving connections intermediate said motor and axle, casings for said motor, axle and connections, said several casings being rigidly connected as a unitary structure, side-bars, a downwardly bent cross bar bridged between the side-bars, and an universal joint which supports the forward end of said connected casings upon the cross bar.

943,242. Carburetter. David Fergusson and Charles L. Sheppy, Buffalo, N. Y., assignors to The George N. Pierce Company, Buffalo, N. Y. Filed June 7, 1907. Serial No. 377,769.

1. In a carburetter, the combination of a casing having a wall of circular cross section forming a throttle valve chamber, said wall having in one side a hole for the passage of the explosive mixture, an air supply passage opposite to the hole in said valve chamber wall, and a mixing chamber having a portion which is located between said circular wall and said air supply passage and is relatively narrow in the direction of the length of the air supply passage whereby one end of the air supply passage is located close to said circular wall, a spray nozzle extending into said air passage and having a discharge orifice opposite and adjacent to said hole, an auxiliary air supply valve for admitting air to said mixing chamber, and a throttle valve in said valve chamber having a hole adapted to be moved into and out of register with the hole in said cylindrical wall by turning said valve, substantially as set forth.

943,505. Automobile tire. Charles E. W. Woodward, Chicopee Falls, Mass., assignor to Fisk Rubber Company, Chicopee Falls, Mass., a Corporation. Filed Oct. 24, 1906. Serial No. 340,300.

1. In a securing means for inflation valves for the inner tubes of tires of automobiles, an inelastic ring secured to the same adjacent the valve opening therein and having an internal diameter greater than that of said opening, means on the valve-stem for retaining the tube and said ring in place, whereby the opening in the tube is prevented from assuming a shape other than circular when the valve-stem is in place, and whereby the inelastic ring is permitted to assume a form other than circular when the valve-stem is removed from the tire, as described.

944,278. Apparatus for Filling Rubber Tires with Viscous Liquids. Albert D. Ray, Cleveland, Ohio, assignor of one-half to C. J. Callahan and one-half to Theodore

Chester, Sunbury, Pa. Filed July 30, 1909. Serial No. 510,355.

1. In an apparatus for filling rubber tires, the combination with a charging vessel provided with an agitator and an air inlet pipe and a charge outlet pipe; of an auxiliary charging vessel adapted to be brought into communication with said air inlet pipe and provided with a valved discharge duct intersecting said charge outlet pipe and terminating in the median portion thereof.

944,293. Control for Driving Mechanisms. Charles B. Stebbins, Three Rivers, Mich., assignor to Sheffield Car Company, Three Rivers, Mich. Filed Nov. 13, 1908. Serial No. 462,442.

1. The combination with a hollow control post standard, of a pair of transmission clutch control posts; a pair of master clutch control posts; a throttle control post; a commutator control post, said several control posts being arranged one within another and within said standard; collars on said posts having bearing portions whereby said posts are revolvably supported; actuating levers mounted upon said clutch control posts; a pivoted shifting lever; jaws on said actuating levers adapted to be engaged by said shifting lever, the jaws of said transmission post levers being faced oppositely and the jaws of said master clutch levers being adapted to be engaged from above and below; a head having guide ways therein for said shifting lever and stops for said transmission and master clutch levers and said shifting lever arranged so that said master clutch levers are adapted, when in their initial positions, to be engaged by said shifting lever after the transmission clutch levers have been shifted thereby to their actuating position; and springs carried by said transmission control post levers for retaining them in their inoperative position, said springs being adapted to be disengaged by said shifting lever.

944,315. Gas Engine Starter. George Buress, Indianapolis, Ind., assignor of one-half to Robert W. Long, Indianapolis, Ind. Filed March 25, 1909. Serial No. 485,581.

1. In combinations with the shaft of an explosive engine, of a gear secured thereon, oscillatory means pivoted away from the gear and its axis, a curved bar pivoted at one end to said oscillatory means and extending beside said gear, and an adjustable pawl on the other end of said bar for engaging the teeth at one side of the gear during the movement of said bar, whereby said gear will be actuated to start the engine.

944,351. Vehicle Wheel Rim. John M. Alderfer, Sharon Center, Ohio. Filed Nov. 7, 1908. Serial No. 461,567.

1. The combination in a vehicle wheel, of a rim provided with a seat for a tire and a tire-retaining means along one side edge thereof, said rim provided with a depending or inwardly extending flange along its opposite side edge having a notch formed therein, an annular removable tire retaining means co-operating with the tire retaining means on said rim provided with an inwardly extending flange having a notch therein adapted to register with the notch in the depending flange of said rim, said removable tire retaining means adapted to be positioned with the depending flange thereof in abutting relation with the face of the depending flange of said rim and a locking element comprising a split, resilient ring having a circumferentially arranged interrupted recess in the outer face thereof adapted to

be sprung over and receive the abutting inwardly depending flanges of said rim and removable tire retaining means with the interrupted portion thereof positioned in the registering notches of said flanges, whereby said removable tire retaining means is locked against circumferential movement.

944,446. Shock Absorber for Vehicles. Frank G. Koehler, St. Louis, Mo. Filed May 7, 1908. Serial No. 431,344.

1. In a shock absorber for vehicles, a pair of pivotally mounted bearers provided with arms, a spring element interposed between said arms, a take-up spring within said spring element, and means having connection with said arms controlled by said take-up spring, substantially as set forth.

944,514. Rim for Motor Car Wheels. Don C. Smith and William F. Gorton, Muncie, Ind. Filed Dec. 20, 1907. Serial No. 407,387.

1. In a wheel, the combination of the felly rim having its face beveled transversely, one of the edges of said beveled face being inclined upwardly and the other downwardly, a tire retaining rim composed of a pair of oppositely disposed rings their inner sides being transversely grooved to receive bolts for securing the sections together their vertical facing edges being provided with a rabbet joint having the ledge its internal face being so formed as to register with the beveled face and its edge inclined or beveled to register with the inclined edge of the felly rim, the said ledge being provided with radially disposed slots at proper intervals opening into semi-circular recesses provided correspondingly in the face of each of said sections; the inner surface of the said tire rim being so formed as to register with and to stand slightly apart from the beveled face, and to reside in contact with the upwardly and downwardly inclined edges of the felly rim, transverse grooves at suitable intervals to register with the corresponding grooves in the felly rim for the reception of means for securing the tire rim to the wheel, substantially as described.

944,538. Speedometer. James H. Bullard, Springfield, Mass., assignor to Bullard Specialty Co., Springfield, Mass., a Corporation of Massachusetts. Filed March 3, 1906. Serial No. 304,137.

1. An instrument of the class described comprising a support for a record dial rotatable at minute hand speed, an hour dial, and a suitable clock movement to actuate the dials, the latter being readable together to indicate the time, means to mark the record dial to indicate successive occurrences, an odometer in proximity to said instrument, and a common actuating mechanism for the odometer and the record dial marking means.

944,576. Cushion Wheel. Henri Oudinot and Charles Putois, Coudray Montceaux, France. Filed Dec. 22, 1908. Serial No. 468,878.

A cushion wheel comprising in combination with the hollow hub having a hollow extension communication with the main part of the hub, vertical flanges of said hub, an inner crown between said flanges having an opening through which the hollow extension communicates with the hollow main part, an outer crown between said lateral flanges having threaded openings, one for each spoke, a flange at the upper end of each of said openings, a nut screwed into said opening having a central boring, an india rubber bag being fixed with a flanged edge of its open end between said nut and

said flange so that its top part projects into the hollow hub, a piston guided in said nut, a stepped head of said piston penetrating into the correspondingly shaped top part of the india rubber bag, metal rings inserted in the inner surface of said bag, each embracing one of the steps of the piston head, means for preventing a lateral deviation of the india rubber bag, a shoe forming the outer end of the spoke, an upwardly directed flange at each of the long sides of said shoe and a downwardly directed flange having an internal groove at each of the long sides at each side of the spokes upon said shoes so as to form a flexible felly, means for securing said rings upon the shoes, a nut for each spoke to press said rings strongly upon its shoe, india rubber sheaths fixed to the lower end of the hollow guide nut of the piston and to the upper end of said pressure nuts forming a lubricating chamber for each piston, the lubricant mainly consisting of castor oil filling said lubricating chamber and the hollow hub and its hollow extension, an air chamber in said hollow extension and a regulating piston in said extension for regulating the pressure in the hub, substantially as described and for the purpose set forth.

944,577. Hydropneumatic Spring. Henri

Oudinot and Charles Putois, Coudray Montceaux, France. Filed Dec. 22, 1908. Serial No. 468,879.

1. A hydropneumatic spring comprising in combination a cylinder filled with suitable liquid, an air chamber filled with air under pressure inclosed in said cylinder, suitable means for guiding said piston in the bottom of the cylinder, an india rubber bag co-operating with the head part of said piston, means for guiding said india rubber bag upon said piston, and means for obtaining a perfect joint between the india rubber bag, the piston and the cylinder, substantially as described and for the purpose set forth.

944,597. Planetary Transmission Mechanism. Alanson P. Brush, Detroit, Mich. Filed April 10, 1908. Serial No. 426,236.

1. In planetary gearing, the combination of a driving shaft, a concentric driven member, and intermediate mechanism including a rotatable transmission member which becomes effective only when its rotation is prevented, a fixed casing in which said mechanism is inclosed, and a multiple disc clutch for frictionally connecting said transmission member to the casing.

944,674. Shock Absorber for Vehicles.

Frank G. Koehler, St. Louis, Mo. Filed July 18, 1907. Serial No. 384,384.

1. The combination with a vehicle frame and an axle, of a shock absorber comprising a pair of bell crank levers, each having an inner arm pivotally connected to and depending from said axle and an arm extending laterally from the lower end of the inner arm and pivotally connected to said vehicle frame, and a compression spring located between said inner arms.

944,675. Shock Absorber for Vehicles. Frank G. Koehler, St. Louis, Mo. Filed Jan. 15, 1908. Serial No. 410,909.

1. In a shock absorbing device for vehicles, the combination with a vehicle body frame and axle, of a pair of bearers having pivotal connection with said body frame at their outer ends, pivoted to said axle at their inner ends and having spring seats, a cushion spring held to the spring seat of one of said bearers, and a take up spring interposed between the spring seats of said pair of bearers, substantially as set forth.

944,676. Shock Absorber for Vehicles. Frank G. Koehler, St. Louis, Mo. Filed May 7, 1908. Serial No. 431,345.

1. In a shock absorbing device, the com-

bination with a vehicle body and axle, of a hanger carried by said body, bell crank levers pivotally connected to said hanger, a support carried by said axle, links pivotally connected to said support and to which links one arm of each of the bell crank levers is pivotally connected, and resilient means interposed between the other arms of said bell crank levers, substantially as set forth.

944,677. Shock Absorber for Vehicles. Frank G. Koehler, St. Louis Mo. Filed May 13, 1909. Serial No. 495,757.

1. The combination in a shock absorbing device, of a pair of laminated main springs, one of the laminations of each main spring being bent at an angle to the body of the spring to provide a spring arm, and a cushioning spring interposed between the springs arms.

944,772. Anti-Skid Attachment for Vehicle Wheels. Thomas T. Chaloner, New York, N. Y. Filed March 31, 1909. Serial No. 486,866.

An anti-skidding attachment, comprising a body portion, straps integral with said body portion extending from opposite sides thereof, studs for said body portion, means for securing said studs to said body portion, one of said straps being adapted to be threaded through the other of said straps, and means for securing said straps together.

944,783. Vehicle Bearing. Henry Hess, Philadelphia, Pa. Filed Feb. 28, 1906. Serial No. 461,652.

1. A vehicle shield comprising two sections, the lower section having a frame comprising tubular stiles in which the stiles of the upper section are slidably mounted, the stiles of the lower section being slotted to accommodate the upper section; and means for closing the slots.

944,863. Ball Bearing. Henry Hess, Philadelphia, Pa. Filed Feb. 28, 1906. Serial No. 303,389.

1. In a self-contained bearing, the combination of a bearing ring having a race, another bearing ring composed of two parts and having a race, the intersection of the parts of said ring being to one side of the ball contact line, and a retaining ring permanently securing the parts of the two-part ring together, the adjacent faces of the retaining ring and the two-part ring having complementary gripping surfaces.

944,906. Detachable Rim for Pneumatic Tires. Pietro Petracchi, Varese, Italy. Filed Oct. 18, 1906. Serial No. 339,424.

1. A detachable rim for pneumatic tires, divided in its medial portion along a plane perpendicular to its axis, each part provided

with means to hold the outer tire tube, the inner face of the two-part rim being beveled at an inclination to the axis, an annular wedge member arranged to fit between the beveled interior face of the rim and the cylindrical outer face of the felly, and means bearing from opposite directions against the thicker edge of the rim and the wedge member to lock the same together and to the felly.

944,975. Heating of Compressed Air for Use in Motors. William H. Sodeau, Newcastle-upon-Tyne, England, assignor to W. G. Armstrong Whitworth & Company, Limited, Newcastle-upon-Tyne, England. Filed March 25, 1907. Serial No. 364,519.

1. A device for heating compressed air by burning in it a fuel, comprising in combination, a combustion chamber, inlet means for air into said combustion chamber, a deflector situated over the air inlet means and interrupted between the fuel inlet means whereby the main volume of the incoming air is deflected away from the fuel inlet means, said deflector having openings of small area whereby a relatively small quantity of air is passed to support combustion of the fuel issuing from the fuel inlet means.

**"MERE IMPROVERS, NOT PIONEERS"**

Court so Describes Mabley and Franquist  
Who Challenged Stevens-Duryea Clutch  
—Their Suit is Dismissed.

Manufacturers and designers of cars having a clutch mechanism which is removable without taking out the crankshaft of the engine or the transmission shaft back of the clutch, or without disturbing them, may breathe easier as the result of a decision, on the 12th inst., by Judge Ray, in the United States Circuit Court for the Southern District of New York, involving the patent situation regarding such construction.

The complainant in the case is the Continental Automobile Co., of New York, patentee, as assignee of Mabley and Franquist, alleged inventors of improvements in clutch mechanism and who were at one time identified with the now deceased Smith & Mabley interests in the Simplex car. A. G. Spalding & Bros., the New York dealers, appear as defendants, but inasmuch as the suit relates to the Stevens-Duryea car which they handle, the defense was borne by the Stevens-Duryea Co., of Chicopee Falls, Mass. Judge Ray's finding is for the defendants, and his opinion contains a most exhaustive review of the prior art concerning clutch mechanisms, where easy replacement or removal of clutch parts was sought.

Suit in equity was brought by the complainant to restraint alleged infringement of patent No. 883,552, issued March 31, 1908, to the Continental company, the attorneys in the case being Edwards, Sager and Wooster, with Clifton V. Edwards and Julian S. Wooster of counsel for complainant, and Redding, Greeley and Austin, with William A. Redding and Albert M. Austin of counsel for defendants. The patent concerns "a clutch mechanism, removable as a whole with all of its wearing parts without disassembling, from between the engine and transmission shafts, and without disturbing either of these shafts."

Although the patent describes a construction having a reverse cone clutch, while the Stevens-Duryea car has a multiple disc clutch, there exists a common facility in the case, with which the clutch mechanism as a unit may be taken out with no serious disturbance of the shafts forward or back of it. In his opinion, however, Judge Ray declares that "giving the claims of the patent the broadest construction to which they are entitled the defendant company does not infringe."

"If the function of the mechanism of the patent in suit," says the court at another point in the decision, "is to provide a removable clutch mechanism carried by an intermediate driven shaft, the prior art shows several constructions performing that function and having such intermediate shaft. Mabley and Franquist were not pioneers; they were mere improvers."

**Four More Get Selden Licenses.**

Seventy-three American makers and three importers, who all together represent 79 makes of cars, are now included in the list of licenses under the Selden patent, as the result of several additions made during the past week by the Association of Licensed Automobile Manufacturers. Among the new names are the Courier Car Co., of Dayton, O., making the Courier Car; the Smith Automobile Co., Topeka, Kan., making the Great Smith; the Ohio Motor Car Co., Carthage, O., producing the Ohio; and the Speedwell Motor Car Co., of Dayton, O., manufacturing the Speedwell.

**Stepney Interests Under New Name.**

The Spare Motor Wheel of America, Ltd., St. Anne, Ill., which in addition to introducing the Stepney spare wheel in the United States, also has taken up the manufacture of standard clincher and demountable rims on a large scale, has been reorganized and its capital greatly increased. It will be known in the future as the United States Wheel and Rim Co., Ltd., and plans are made for an expansion which will double the present capacity of 1,000 rims per day.

**[MOVE MADE IN THE SELDEN SUIT**

Ford Called on to Show Cause why Columbia Should not Replace Electric Vehicle  
—Decree will Follow.

The actual entering of the decree in the Selden patent case against Ford and against Panhard & Levassor, which was decided by Judge Hough in the United States Circuit Court for the Southern District of New York last fall, has been advanced toward consummation by the obtaining of an order from the court calling on the defendants to show cause why the name of the Columbia Motor Car Co. should not be substituted as party complainants with George B. Selden in place of that of the Electric Vehicle Co., of which the Columbia company is a reorganization.

The order is returnable April 1 and the defendants must serve complainants' counsel with answering papers on or before March 28. It is also provided that they must show cause why their time for pleading should not be limited to April 11th, and why the time for taking testimony should not be limited and the scope of the testimony limited to the matter of transfer of interest from the Electric Vehicle Co. to the Columbia company.

Whatever postponement or extensions may be granted beyond the dates mentioned are discretionary with the Court, with consideration for cogent reasons and it would not appear that the machinery which has been set in motion should suffer any serious delay in grinding out the decree. With actual entering of the decree a new impulse in the litigation may be expected, since Ford has declared his intention of taking an appeal. The Selden interests will be placed in a position to "foreclose" in those cases where an appeal is not taken, and much more "action" in the litigation generally is promised. In the appealed cases the Court will have discretionary powers as to the amount of bond to be filed.

## U. S. MOTOR TAKES UP ITS TASKS

**Buys Tichenor-Grand Building for Headquarters—Directors Announced—Purchasing Departments Combined.**

The United States Motor Co., having effected its official organization and taken over the general sales management of the products of its constituent companies, which include the Maxwell-Briscoe Co., the Brush Runabout Co., and the Columbia Motor Car Co., has established itself in temporary headquarters at 505 Fifth avenue, occupying the entire ninth floor until the big Tichenor-Grand sales stables and riding academy building, which has been bought for the purpose, can be remodeled to serve as the general offices. The latter building is seven stories high and runs from Sixty-first to Sixty-second street, incidentally overlooking Broadway and Columbus Circle. The value of the property, the purchase of which was consummated this week, is estimated as exceeding \$600,000.

Announcement of the names of those composing the board of directors of the merger was made on Tuesday of this week, the list including Benjamin Briscoe, J. D. Maxwell, Richard Irvin, W. H. Crosby, Henry M. Tobey, J. C. Brady, Herbert Lloyd, Carl Tucker and Kenneth B. Schley. Briscoe and Maxwell are the company's president and first vice-president, respectively, while Irvin, who is the head of Richard Irvin & Co., bankers at 25 Broad street, is chairman of the finance committee. Crosby is assistant secretary of the United States Motor and the Maxwell-Briscoe Motor Co., and Tobey is of the law firm of Ward, Hayden & Satterlee, which is supposed to represent Morgan interests to some degree, as Satterlee is a son-in-law of J. Pierpont Morgan. J. C. Brady is a son of Anthony N. Brady, who is prominent in traction interests and is associated in the Electric Storage Battery Co., of which Lloyd is president in addition to heading the Columbia Motor Car Co. The treasurer of the United States Motor Co., Carl Tucker, who also appears on the board, is Anthony Brady's son-in-law, while Kenneth B. Schley serves as the necessary resident New Jersey director.

In accordance with intention announced by President Briscoe, the purchasing departments of the constituent companies have been consolidated and have been placed under the general supervision of A. R. Gormully, who for the past four years has been the purchasing agent for the Maxwell-Briscoe company.

Henry W. Nuckols, who has been vice-president and general manager of the Columbia Motor Car Co., is slated for the presidency of that company, to succeed Herbert Lloyd, while C. W. Kelsey, who was recently transferred from his position as

sales manager of the Maxwell-Briscoe Co. to a similar position at the Columbia plant in Hartford, will succeed Nuckols as vice-president in addition to handling sales matters.

### Abandons Over-alls for Automobiles.

The Carhartt family, well known in Detroit, Mich., as wealthy manufacturers of "over-alls," is to embark in the manufacture of motor cars. The Carhartt Co. has been organized for the purpose, with a capital of \$500,000, of which \$300,000 is common and the remainder preferred stock. The senior Carhartt is to be president and Hamilton Carhartt, Jr., will be made vice-president and will retire as general manager of the Carhartt over-all factories in Detroit and Toronto. The mechanical department will be in charge of Ralph C. Lewis, who will be secretary also of the company. A factory at 1524 Jefferson avenue is to be ready by April 1 for the production of a car to sell at \$2,500; meanwhile temporary offices have been taken at room 902 Ford building.

### Firestone Capital to be Four Millions.

The Firestone Tire & Rubber Co., of Akron, O., has voted to raise its capitalization from \$50,000 to \$4,000,000, and to offer \$500,000 of the new preferred shares for sale. The company was incorporated in 1900 under West Virginia laws with \$50,000 capital, but at a recent stockholders' meeting a plan was approved by which it will be incorporated under Ohio laws, with \$3,000,000 in common stock and \$1,000,000 in preferred. A new factory is to be built, requiring an outlay of almost \$1,000,000, and the increased capitalization is incident to the program of expansion.

### Electric Vehicle Receivers Discharged.

Final discharge of the receivers of the Electric Vehicle Co., of Hartford, Conn., the bankruptcy of which was followed by its reorganization as the Columbia Motor Car Co., was granted in Superior Court, at Hartford, on the 4th inst. Judge Ralph Wheeler approved the action of the receivers, H. W. Nuckols and H. M. Barrett, in their disposal of the assets and discharged them from further duty as receivers in accordance with their petition.

### General Motors Moves Two Properties.

The Randolph Motor Car Co., of Chicago, Ill., and the MacClean Wheel Co., of Cleveland, O., both of which recently were acquired by the General Motors Co., are to be moved to Flint, Mich. The MacClean company builds a spring wheel of a type used on commercial vehicles.

### Bosch Locates a Branch in Detroit.

The Bosch Magneto Co., of New York, has established a branch in Detroit, Mich., at 870 Woodward avenue; it, of course, carries a complete stock of Bosch magnetos and the parts thereof.

## FRANCE SELLS TO THE FOREIGNERS

**Its Increasing Exportation of Cars Keeps Its Makers Busy—Importations Also Reveal an Expansion.**

Despite the fact that the sale of motor cars in France is almost at a standstill, so far as the Frenchmen themselves are concerned, the export trade has served to keep the native industry at the top of the heap, the exports during the year 1909 showing a substantial increase. While during the year 1908 automobiles valued at 127,299,000 francs (\$25,459,800) were sent from France to foreign countries, this amount increased during the year 1909 to 146,615,000 francs (\$29,323,000), a gain of nearly four million dollars. France shipped more than six times as many motor cars as either England or Germany, while the United States exported less than \$8,000,000 worth in 1909. The principal markets of the French cars were the following:

	1909. Francs.	1908. Francs.
Russia .....	4,409,000	3,327,000
United Kingdom ...	62,844,000	61,056,000
Germany .....	9,902,000	10,456,000
Belgium .....	21,844,000	11,547,000
Switzerland .....	2,937,000	1,930,000
Italy .....	2,885,000	2,180,000
Spain .....	3,336,000	2,843,000
Austria-Hungary ...	807,000	336,000
Turkey .....	597,000	652,000
United States .....	8,053,000	11,003,000
Brazil .....	1,894,000	2,137,000
Argentina .....	6,128,000	4,338,000
Algeria .....	8,851,000	5,403,000

On the other hand, during last year France's importation of motor cars increased over 1908, though falling short of the 1907 figures by over 1,200,000 francs. Imports during 1909 were distributed thus:

	1909. Francs.	1908. Francs.
United Kingdom ....	1,279,000	588,000
Germany .....	2,151,000	2,644,000
Belgium .....	1,209,000	1,007,000
Switzerland .....	756,000	376,000
Italy .....	1,444,000	1,411,000
United States .....	441,000	133,000

### Move to Centralize Whiting Production.

The Flint Wagon Works, which makes the Whiting car, has arranged to centralize its manufacturing operations by moving its engine factory to Flint, Mich., from Detroit, where for the past 18 months the Whiting motors and transmission gears have been made. The machinery from the Detroit plant will be installed in a building adjacent to the home factory in Flint.

### Hopeful Outlook for Petrel Creditors.

The schedule of liabilities of the Petrel Motor Car Co., of Milwaukee, Wis., which recently went into bankruptcy after a brief career in the manufacture of automobiles, indicates that the concern will come close to paying its creditors in full. The liabilities are \$62,458.51 and the assets are placed at \$62,434.67.

**STILL "HAWKING" LINDSAY PATENT**

**Latest Effort to Sell It Revives Reports of an Independent Association—The Patent and Its Status.**

Despite the discouragements they have encountered during the last year or so, the promoters who have been seeking to organize an automobile manufacturers' association around a "basic" rear axle patent, to resist and rival the Association of Licensed Automobile Manufacturers and its Selden patent, continue to attempt the enlisting of "unlicensed" car makers in their project. Their solemn activities, surrounded by a proper air of important mystery, at last have succeeded in breaking into print, with the representation that the movement may assume the dignity of succeeding the defunct American Motor Car Manufacturers' Association, in bringing together the makers who are outside the Selden camp.

To strip away much of the "mystery" and "speculation" surrounding the movement, the patent on which it largely hinges is known as the Lindsay patent, relating to live axle construction and alleged to be basic as applied to full floating axle construction. This patent, No. 748,760, was issued January 5, 1903, to Thomas J. Lindsay, by direct and mesne assignments to himself and Willard Harmon, Indianapolis, Ind., and has been hawked about among the so-called "independent" makers by the promoters for a considerable period. While the American Motor Car Manufacturers' Association still was flourishing, the patent was suggested to that body as a means of combating the aggression of the Selden camp, but after a careful consideration of its merits and possibilities it was let alone.

Various individual makers then in the "independent" or "unlicensed" ranks gave it examination, but failed to see in it the potency ascribed to it by those having it in control, the latter including an attorney in Newcastle, Ind., and E. R. Russell, who still is seeking to make it the nucleus for an organization of "unlicensed" makers. There is also another Lindsay axle patent relating to a peculiar method of framing and of driving by means of gear reduction within the rear wheels, but according to expert opinion it appears to relate principally to electric vehicles.

In the first and chief patent there are nine claims, as granted after the claims had been rejected and amended or altered five different times. Numerous interferences were declared in the Patent Office, and considerable restriction and amendment was necessary before the claims were acceptable. Their general character is indicated by the first, which is as follows:

1. In a motor driven vehicle, the hollow

axle structure adapted to support the vehicle body, said hollow axle structure having an enlarged portion consisting in part of a transversely movable cap, a compensating gear mounted in said enlarged portion, a pair of shaft sections rotatably mounted within the hollow structure, an axial separable driving connection between each shaft section and the compensating gear, and independent means for normally retaining each shaft section against axial displacement, within this structure, said means being movable to permit the outward withdrawal of the shaft sections from the structure.

For a time one of the big axle making companies had a license arrangement under the patent, but later modified its construction and ceased to pay tribute. Investigation by the attorneys of those to whom the patent subsequently was submitted developed an imposing list of other axle patents of similar character.

**Standardized Rims up Once More.**

Owing to the illness of Hugh Chalmers and the delayed attendance of other members, the executive committee of the Association of Licensed Automobile Manufacturers did not hold the meeting which was scheduled for yesterday (Wednesday). Among other matters which the committee was to consider was an appeal from the United Rim Co. for a further consideration by the Association of the proposition for two standard forms of quick detachable rim espoused by the tire makers, who are willing to compromise their patent interests through the rim company in order that standardized types might be manufactured. The tire committee of the Association recently rejected the Rim company's idea, and if the A. L. A. M. executive committee does not see fit to rescue it the standard rim project probably will be abandoned.

**More Trucks Coming from Detroit.**

The Cass Motor Truck Co., organized with a capitalization of \$300,000, has been added to Detroit's roster of makers and intending makers. The company proposes to make a four cylinder, chain drive truck, of one ton capacity, which is to sell for \$1,800. It was designed by Adelbert Banta. The organizers of the concern include John I. Turnbull, George C. Epstean and F. W. Ferguson, real estate men, and Alex. M. Spater, of Spater Bros., wholesale woodenware. Spater is to be secretary and treasurer.

**Bretz Goes for European Visit.**

J. S. Bretz, of the J. S. Bretz Co., New York City, has sailed for a three weeks European trip, in the course of which he will visit the several manufacturers whose products the Bretz company handles in the United States, including U. & H. magnetos, F. & S. bearings and Bowden wire mechanism. His first stop will be in London, after which he will go to Paris, Berlin and Schweinfurt.

**MAYO MAY EXERCISE HIS OPTION**

**Knox's President Likely to Obtain Entire Control of Company—Plans for Reorganization Already Formulated.**

Reorganization plans for the Knox Automobile Co., of Springfield, Mass., are under consideration whereby A. N. Mayo, president of the company, will buy out the interests of the other large holders of the common stock and will retire the preferred stock, following which a new issue may be made, greatly increasing the capitalization. The capital stock at present consists of \$363,000 of common stock and \$494,700 of 8 per cent. cumulative preferred, which latter was issued about two years ago and accepted by creditors in lieu of cash. The company has enjoyed considerable prosperity during the past year, having made a net profit estimated as something over \$160,000, and the preferred shares have risen in value until they now are quoted at about 85. It is retireable at par on call, and President Mayo also is understood to have an option on the common stock held by E. H. Cutler and his brother, and by other large holders, including Peter Murray, Albert E. Smith, treasurer of the company, and W. E. Wright, general manager. The option is in effect to January 1, 1911, and calls for the delivery of the common stock at 80. The full exercise of this option on the common stock and the retirement of the preferred shares would place the control of the Knox company entirely in Mayo's hands. He is at present in Florida and will return in April.

**"Fever" Spreads to Health Resort.**

Having caught the fever from Detroit, which is not far distant, Mt. Clemens, Mich., famous as a health resort, is to have an automobile manufacturing plant. The Mt. Clemens Motor Car Mfg. Co. has filed articles of association, with \$200,000 capital, of which \$75,000 is represented as having been paid in. The incorporators include Robert Klagge, Fred Breitmeyer and Charles Lonsby, of Mt. Clemens, and H. H. Thorpe, of Detroit. Ten acres of land have been acquired for a factory site, between Floral avenue and the Grand Trunk Railway, near Church street, and a building 300x60 feet will be commenced at once. A motor delivery wagon will be the concern's initial product.

**Tuttle to Establish Engine Plant.**

The Tuttle Motor Co. which is to be a reorganization of the D. M. Tuttle Co., is to establish a plant in Canastota, N. Y., for the manufacture of automobile motors. The enterprise is to be capitalized at \$150,000 and the site of the old Patten & Stafford factory has been selected for manufacturing operations.

**THE WEEK'S INCORPORATIONS.**

Dayton, O.—Miami Auto Co., under Ohio laws, with \$10,000 capital.

Chicago, Ill.—Halladay Motor Co., under Illinois laws, with \$5,000 capital.

Cleveland, O.—Van Sciever Auto Co., under Ohio laws, with \$10,000 capital.

Flint, Mich.—Flint Auto Top Co., under Michigan laws, with \$10,000 capital.

Osage, Iowa.—Osage Auto & Supply Co., under Iowa laws, with \$5,000 capital.

Connersville, Ind.—Indiana Lamp Co., under Indiana laws, with \$10,000 capital.

Blackfoot, Idaho.—Idaho Motor Car Co., under Idaho laws, with \$10,000 capital.

Cleveland, O.—Broc Electric Vehicle Co., under Ohio laws, with \$250,000 capital.

Ann Arbor, Mich.—Hartman Garage Co., under Michigan laws, with \$7,000 capital.

Auburn, Ind.—Double Fabric Tire Co., under Indiana laws, with \$10,000 capital.

Denver, Colo.—E. R. Holmes Motor Co., under Colorado laws, with \$50,000 capital.

Cleveland, O.—Schoelkopf Auto Radiator Co., under Ohio laws, with \$25,000 capital.

Bay City, Mich.—Wolverine Auto Co., under Michigan laws, with \$7,500 capital.

Cleveland, O.—Cleveland Auto Trading Co., under Ohio laws, with \$5,000 capital.

Lebanon, O.—Lebanon Auto & Storage Co., under Ohio laws, with \$25,000 capital.

Louisville, Ky.—Banks Motor Car Co., under Kentucky laws, with \$25,000 capital.

Oklahoma City, Okla.—Columbia Taxicab Co., under Oklahoma laws, with \$30,000 capital.

Port Huron, Mich.—Huron Auto Body Co., under Michigan laws, with \$25,000 capital.

Alexandria, S. D.—Alexandria Auto Co., under South Dakota laws, with \$25,000 capital.

Aberdeen, S. D.—Hub City Auto Co., under South Dakota laws, with \$25,000 capital.

North Yakima, Wash.—Western Auto Co., under Washington laws, with \$10,000 capital.

Elkins Park, Pa.—Harvey Automobile Co., under Pennsylvania laws, with \$5,000 capital.

Minneapolis, Minn.—Tri-State Automobile Co., under Minnesota laws, with \$50,000 capital.

Kansas City, Mo.—Motor & Machine Supply Co., under Missouri laws, with \$50,000 capital.

Allenton, Wis.—Washington County Auto Co., under Wisconsin laws, with \$10,000 capital.

Cleveland, O.—Independent Taxicab & Auto Service Co., under Ohio laws, with \$50,000 capital.

Cleveland, O.—Leese-Neville Co., under

Ohio laws, with \$10,000 capital; to manufacture auto parts.

Oklahoma City, Okla.—Severin-Lumbard Tire & Rubber Co., under Oklahoma laws, with \$12,000 capital.

Philadelphia, Pa.—Ideal Auto Tire Co., under Delaware laws, with \$125,000 capital; to manufacture tires.

Philadelphia, Pa.—Ideal Auto Tire Co., under Delaware laws, with \$125,000 capital; to manufacture tires.

Indianapolis, Ind.—McFarland Six Sales Co., under Indiana laws, with \$10,000 capital; general automobile business.

Philadelphia, Pa.—Ideal Auto Tire Co., under Nebraska laws. Corporators—William N. Horn, H. L. and George E. Pritchett.

Madison, Wis.—Harloff-Pence Co., under Wisconsin laws, with \$25,000 capital; to manufacture automobiles and other vehicles.

Janesville, Wis.—Willard Harlow Mfg. Co., under Wisconsin laws, with \$25,000 capital; to manufacture spark plugs and specialties.

Memphis, Tenn.—Jerome P. Parker Co., under Tennessee laws, with \$100,000 capital; to deal in automobiles, carriages and bicycles.

Omaha, Neb.—Western Automobile Supply Co., reorganized under Nebraska laws. Corporators—William N. Horn, H. L. and George E. Pritchett.

Canastota, N. Y.—Tuttle Motor Co., under New York laws, with \$150,000 capital; to manufacture motors. Corporators—D. M. Tuttle and others.

Minneapolis, Minn.—Goosman - Johnson Co., under Minnesota laws, with \$50,000 capital; general automobile business. Corporators—G. W., H. G. Goosman and Louis Johnson.

Washington, D. C.—Lincoln & Ballard, under District of Columbia laws, with \$4,000 capital; general automobile business. Corporators—Fred S. Lincoln, Walter M. Ballard and others.

Philadelphia, Pa.—Hess-Bright Co., under New Jersey laws, with \$5,000 capital; to deal in automobiles and supplies. Corporators—F. R. Hansell, John A. MacPeak and W. T. Eidell.

Chicago, Ill.—Hallway Motor Co., under Illinois laws, with \$5,000 capital; automobiles and other articles of merchandise. Corporators—P. R. Chubbuck, J. C. Barlow and Thomas Ferguson.

Cleveland, O.—The Ignition Co., under Ohio laws, with \$100,000 capital; to manufacture electrical apparatus. Corporators—G. O. Welch, James Bachman, J. Foster, Jr., R. Inglis and R. J. Buckley.

Buffalo, N. Y.—Niagara Gasoline Motor Co., under New York laws, with \$50,000 capital; to manufacture motors, engines, supplies, etc. Corporators—C. Jempson, M. M. Hedden and D. M. Billington.

Ridgewood, N. J.—Baldwin & Covert, under New Jersey laws, with \$50,000 capital; to operate garages, etc. Corporators—M. D. Baldwin, Ridgewood; O. S. Baldwin, Brooklyn, N. Y.; L. Covert, New York City.

Buffalo, N. Y.—Federal Motor Co., under New York laws, with \$10,000 capital; to manufacture motors and motor cars. Corporators—Henry A. Dann, Troilus C. Koons, Ernest C. Anderson and Clyde R. Sikes.

Mt. Clemens, Mich.—Mt. Clemens Motor Car Mfg. Co., under Michigan laws, with \$200,000 capital; to manufacture motor cars. Corporators—Robert Klagge, Fred Breitmeyer, Charles Lonsby, Mt. Clemens; H. H. Thorpe, Detroit.

Detroit, Mich.—Cass Motor Truck Co., under Michigan laws, with \$300,000 capital; to manufacture commercial vehicles. Corporators—John I. Turnbull, George G. Epstein, F. W. Ferguson and Alexander M. Spater.

Chicago, Ill.—Aero & Auto Tavern Co., under Illinois laws, with \$25,000 capital; restaurant, hotel, automobile and merchandise business. Corporators—William L. Carlin, Herbert C. Hall and Frederick McH. Kitching.

Watertown, N. Y.—Gould Automobile Co., under New York laws, with \$500 capital; to manufacture automobiles and accessories, etc. Corporators—A. W. and W. L. Gould, Watertown; W. S. Rice, Adams, Jefferson County, N. Y.

New York, N. Y.—Orson Automobile Co., under New York laws, with \$10,000 capital; to manufacture motor cars. Corporators—Percy A. Rockefeller, H. O. Havemeyer, Frank A. Vanderlip, Horace M. Kilborn and Charles G. Gates.

Syracuse, N. Y.—Globe Malleable Iron & Steel Co., under New York laws, with \$300,000 capital; foundry and machine shop; to manufacture malleable iron castings. Corporators—A. T. Brown, W. C. Lipe, Syracuse; F. H. Gates, Chittenango, N. Y.

New York, N. Y.—Studebaker Vehicle Co., under New York laws, with \$8,600,000 capital; to manufacture and deal in engines, motors, etc.; also automobiles, motorcycles, boats, wagons and other vehicles. Corporators—F. P. Delafield, New York City; Clement Studebaker, Jr., Frederick S. Fish, South Bend, Ind.

**Increases in Capitalization.**

Chicago, Ill.—Automobile Maintenance & Mfg. Co., from \$30,000 to \$100,000.

Detroit, Mich.—Lozier Motor Co., of Michigan, from \$10,000 to \$2,000,000.

Jackson, Mich.—Frost Gear & Machine Co., manufacturers of auto parts, from \$60,000 to \$100,000.

Detroit, Mich.—Gies-Hoyt Mfg. Co., manufacturers transmission gears, from \$10,000 to \$50,000; Eby Motor Parts Co., from \$5,000 to \$15,000.

## IN THE RETAIL WORLD.

Lake City, Fla., is to have a new garage; C. E. Windhovel and J. A. Briere are building it.

John C. Bowman and others, of Lebanon, Pa., are making ready to erect a garage in Cumberland street.

Joseph Williamson, Jerseyville, Ill., has rented the Bowman building on East Pearl street and will open a garage. Renting also will be featured.

The Bluffton Auto and Electric Co. has opened a new garage on West Market street, Montpelier, Ind. The building is of brick and cost \$2,750.

A. J. Schnell is building a new brick garage 40x75 feet, to cost \$2,000, at 119 Jefferson avenue, Scranton, Pa. He will handle Pullman automobiles.

Thé McIntyre Automobile Co., Omaha, Neb., now is established in its new garage at 2203 Farnam street. It handles the Welch, Oakland, Staver and Gleason cars.

A. G. Spalding & Bros., Philadelphia branch, which long has handled Stevens-Duryea gas cars, has "gone into" electrics also; the Babcock is the line selected.

Louisville, Ky., has a new automobile firm in Fulton, Conway & Co., which has established itself at 819-821 West Main street. It will handle the E-M-F. and Flanders cars.

Beaver & Barber, Lincoln, Ill., have "opened up" in that place in a new brick and concrete garage 45x90 on Logan street. They will represent the Chalmers, Hudson and Haynes.

Mernitz Bros., Freeport, Ill., have purchased the garage of Fred Jastram. The latter will enter the manufacturing field, confining himself to the production of gasoline engines.

D. A. Myers, Wichita, Kan., has felt the call of the trade and embarked in business for himself. He has taken on the Elmore line and will have show rooms at 156 North Emporia avenue.

W. H. St. John, Oshkosh, Wis., has acquired the interest of J. C. Zimmerman in the Green Bay Motor Car Co., of the latter city. The new partner will remove to the scene of his latest venture.

After being out of commission during the winter months, the Goshen Auto Tire Repair Co., Goshen, Ind., has taken down its shutters and is again open for business. R. C. Jones will continue as manager.

Pretentious new quarters are being provided for the Hughes Auto Co., of Hastings, Neb., adjoining the Lepin Hotel. The new building is 45x125 feet, of pressed brick and steel girders, with plate glass front.

J. J. Meyer, Orange, N. J., who operated a garage on Cone street, has acquired the White Automobile Co., 494 Main street, East Orange, to which location he has removed. He will continue to handle Auburn cars.

The Lord Motor Car Co., Los Angeles, Cal., will open a branch garage and sales-

room in Pasadena during the current month. The building, which will be one of the best appointed motor car establishments in Southern California, will be two stories, 56x258, and will have complete machine-shop facilities.

The Standard Motor Car Co., Nashville, Tenn., is the corporate title of a new concern which has been organized by F. O. Draughon to do a general repair and livery business. It is located at Seventh avenue and Broadway.

The Russell Motor Car Co., New Orleans, La., which recently took possession of new quarters at 2120-2130 Canal street, is building an addition which will be used as a machine shop. It handles the Glide, Regal and Ford lines.

Work soon will be begun on a large addition for the O. G. Roberts Automobile Co., Columbus, O., which will double their floor space. Their establishment is located on East Gay street and is the home of the Stearns, Overland and Marion cars.

Frank P. Fox, a well known motorist of Vincennes and Terre Haute, Ind., is preparing to enter the trade in Indianapolis. He has secured the state agency for the Pope-Hartford and will open salesrooms on North Capitol avenue next month.

The Reimers Motorcar Co., of Louisville, Ky., has taken possession of a new garage and repair shop, of concrete and brick, 52x125 feet. Offices and salesrooms are located on the second floor, and room for eighty cars is provided for in the garage itself.

R. B. Daggett & Co., San Francisco, Cal., who are located at 1630 Van Ness avenue, have undertaken the exploitation of Baker electrics for that territory. They also have established a chain of charging stations at Oakland, San Jose, Mayfield and Berkeley to better care for their patrons.

The H. W. Meier Automobile Co., Long Grove, Ia., will move to Davenport, that state having taken a three years' lease of the old power house building on Brady street. The structure will be completely remodeled for the new occupants, who will market the Reo and Jackson cars.

Oliver B. Brown, formerly of Jackson, Miss., has secured the Stevens-Duryea agency for New Orleans, and will remodel the building at 605-607 Baronne street, in the latter city, into a handsome show room and garage. He will take possession as soon as the alterations are completed.

The Reliance Truck & Garage Co., Columbus, O., is the title of a new firm which has been launched in the Buckeye capital to handle Reliance trucks. Theodore Leonard, Andrew Timberman and George C. Bohn are the leading spirits in the enterprise, which is located at Third and Lynn streets.

Lincoln & Ballard, Inc., Washington, D. C., is the style of a new firm just formed in the capital to take over the business of Fred S. Lincoln, which includes the Spoerer agency. Pending the acquirement of com-

modious quarters on Fourteenth street, the firm will be located at 612 Twelfth street, N. W.

The Johnson Auto Co., Boone, Ia., is preparing to invade the town of Nevada, that state, having closed negotiations for a building 50x100 feet located on the west side of Lynn street. When alterations now in progress are completed the establishment will be opened in charge of J. R. Davidson.

With the admission of several old employees to partnership in the firm, the Totten Auto Co., Rock Island, Ill., has been organized, with W. C. Totten, president, to take over and operate the automobile business of the latter. Elbert G. Don and Frank T. Lynch constitute the new blood in the enterprise.

The W. H. Quackenbush Co., Westfield, N. J., which handled automobiles and bicycles, has run upon financial shoals and Lloyd Thompson has been appointed receiver. The company's liabilities are \$3,700, and unless creditors will agree to a year's extension, it is probable that the assets will yield but 40 to 50 cents on the dollar.

Indianapolis, Ind., has another new automobile enterprise in the Co-Auto Motor Co., which has established itself at 23-25 Kentucky avenue. The firm is composed of several prominent local tradesmen, including John H. Lavison, H. W. Woodmansee and F. W. Weise. Among the line which will be handled are the Stearns, Jackson, Fuller and Monitor trucks.

Following the amalgamation of the Maxwell-Briscoe Motor Co. and the Columbia Motor Car Co., and the announcement that agents of the former line also would handle the Hartford product, R. D. & C. O. Britton, Hartford, Conn., who have handled the Maxwell for several years, have secured the Columbia representation for several counties in the Nutmeg State. They are located at 117-119 Allyn street.

Clinton, Iowa, has a new enterprise in the Hopkins Motor Car Co., which will open salesrooms in the Shoecraft building, First street and Fifth avenue, in a few days. It will handle the Jackson and Fuller lines. G. V. Drake and D. Vanes, two young mechanics of Jackson, Mich., have selected Coldwater as a lucrative field for a garage and repair shop which they will launch shortly. Both have had several years factory experience.

Brown, Thompson & Co., Hartford, Conn., one of the pioneer motor car firms of that city, have begun the construction of a handsome three story service building to better care for the wants of owners of Stevens-Duryea, Lozier and Cadillac cars, for which they are sales agents. The structure, which will be the largest and best appointed motor car establishment in the state, will be located on Temple street, adjoining the firm's present garage and will be 132x108 feet, and brick, concrete and steel will enter into its construction.

### The Changes in Fuller's Affairs.

Mingled wrath and surprise surged in the breast of Harry Fosdick, of the Hol-Tan Co., New York, when last week a trade paper gravely announced that he had been given the management of a branch which the Packard company was to establish in Boston. Similar feelings also afflicted Alvan T. Fuller, the Packard agent in Boston, especially when the error was compounded by a second item stating that upon giving up the Packard agency he would devote himself to the taximeter cab business. What really has happened is that Fuller, who will continue to hold the Packard agency, has relinquished the Cadillac agency, to the extent that after July 1 it will be conducted by Alfred Measure under the name of the Cadillac Automobile Co., of Boston, with headquarters at 372 Boylston street. Measure has been in charge of Fuller's service depot in Brighton. L. W. Conkling, assistant sales manager of the Packard company at Detroit, has resigned that position to become Fuller's office manager.

### Slight Increase in February Imports.

According to the report of George W. Wanamaker, appraiser of the port of New York, 68 automobiles of the total appraised value of \$134,366, were imported during February, 1910, in comparison with 60 cars valued at \$131,870 in February, 1909, and 107 cars valued at \$224,531 in February, 1908. For the first two months of the year, 1910, the figures show 142 cars, valued at \$290,288, compared with 117 cars, valued at \$270,832, and 216 cars valued at \$453,850 in the same period of 1909 and 1908, respectively.

### Four Wheel Drive Wants a Factory.

Zachow & Besserlich, of Clintonville, Wis., who have developed a four-wheel drive car, have made a proposal to Wichita, Kan., to establish a \$200,000 factory in the latter city. F. H. Dean, of Seymour, Wis., represents the company in the negotiations and is endeavoring to learn how much Wichita is willing to give toward the enterprise.

### Diamond to Build in Boston.

The Diamond Rubber Co. has completed the necessary arrangements for the erection of a new garage on Boylston street, Boston, in which its New England branch will be housed. It will be an imposing structure and a distinct addition to the automobile district of the Hub.

### Kincaid Starts His Own Company.

The Kincaid Oil Co. has been started in Providence, R. I., to supply motor car lubricants. Its moving spirit is William Kincaid who formerly was with another oil concern in Providence.

### Another Carriage Company in Line.

The Racine-Sattley Co., of Racine, Wis., a big producer in the carriage trade, is making arrangements to manufacture automo-

biles. Four and six cylinder models are planned, the motors for which are being made by the Holbrook-Armstrong Co., engine builders of Racine, whose plant adjoins the Sattley works.

### Two Efforts to Reduce Duties.

Imported security bolts or lugs for automobile tires, instead of being dutiable at 45 per cent., are entitled to duty at the rate of 1½ cents per pound under the provision in the tariff law for "bolts, whether of iron or steel," according to a decision of the Board of United States General Appraisers, sustaining a claim filed by Charles Dien against the ruling of the collector at New York City. The collector returned the articles for duty at 45 per cent. under the provision for "manufactured articles not specially provided for, composed wholly or in chief value of metal." In deciding for the importer the board finds that "the article is actually an iron or steel bolt, and there is nothing in the record to indicate that the leather and cotton material added thereto represents other than a small part of its value."

Less successful, however, was the effort of William H. Stiner & Son to secure a reduction from the 45 per cent. duty in the case of automobile parts which they imported. The appraisers could not see that the parts should be classed as "steel shapes," as contended by the importers and which would give a lower rate, and the collector was sustained in assessing the full 45 per cent.

### Newark Association Elects New Member.

At a meeting of the executive committee of the New Jersey Automobile Trade Association, held in Newark, N. J., on the 4th inst., the Weldon & Bauer Co. was elected to membership. It was decided to hold the annual meeting, election of officers and dinner on Wednesday night, March 30.

### Creditors Get 96 Cents on the Dollar.

The Chicago Vulcanizing Co., of Chicago, Ill., which some time ago was placed in the hands of a trustee in bankruptcy, with \$50,000 liabilities to 226 creditors, has paid 96 cents on the dollar. John H. Kelly, the trustee, has been discharged and the business will be continued.

### More Freight Cars for Automobiles.

Increased recognition is being given to the needs of the automobile industry by the railroads. The American Car & Foundry Co. has received an order for 2,000 new cars of special length and door width for the requirements of motor car shippers.

### Toops to Manufacture Specialties.

The Toops Auto Hood Co. has been formed in Indianapolis, Ind., with a capitalization of \$25,000, to manufacture automobile specialties. The directors are Emory D. Toops, Frank Schlusser and C. B. Clarke.

### Special Cars for Wall Street Men.

Taking a little "flyer" in automobile manufacture, about 100 men prominent in Wall street financial circles have "chipped in" enough to start an enterprise which has been incorporated with \$10,000 nominal capital and which is to be called the Orson Automobile Co. It is planned to build a 40 horsepower car for each of the stockholders at cost, after which the concern may build cars for outsiders if conditions seem favorable. Horace M. Kilborn, vice-president of the National City Bank, is credited with originating the project, and Frank A. Venderlip, Charles G. Gates, H. O. Havemeyer, Myron T. Herrick and Percy Rockefeller are among those in the group. One car already has been built and is being exhibited in a basement at 50 Wall street, and a factory at Springfield, Mass., is being considered.

### Lauth-Juergens Gets a Factory.

The Lauth-Juergens Motor Car Co., of Chicago, Ill., which has been operating in a small way, has arranged to establish a factory at Fremont, O., for the manufacture of pleasure cars and commercial vehicles. It is intended to have the factory running by the first of April.

### Lozier Selects Site in Detroit.

The Lozier Motor Co. has selected a site for its factory in Detroit, Mich. It has purchased 60 acres of land on Mark avenue, running from St. John's avenue to Conner's creek, paying a price estimated at \$72,000. The site is in St. Clair Heights, a Detroit suburb.

### Boat Makers to Build Bodies.

The Racine Boat Mfg. Co., of Grand Rapids, Mich., in addition to its boat building activities, has taken up the manufacture of automobile bodies. It will supply the requirements of the Henry Motor Car Co., of Grand Rapids.

### Sandusky Makes Schacht an Offer.

The Schacht Automobile Mfg. Co., of Cincinnati, O., is negotiating for the removal of its factory to Sandusky, O. The Sandusky Business Men's Association has made the company an offer which makes the transplantation attractive.

### Kilgore Opens New York Offices.

The Kilgore Mfg. Co., of Boston, Mass., has established headquarters in New York City. It has taken a suite of offices at 1296 Broadway, from which the sale of its shock absorbers in the metropolitan district will be handled.

### Wisconsin Reports a Sawdust Fuel.

What is claimed to be a new fuel for motor cars has been invented by two young men of Rhinelander, Wis. It is made by the action of fulminic acid on hardwood sawdust and is fed to the carburetter and engine in the usual way.

**BOSTON SHOW IS TO BE "LICENSED"**

**Hub Dealers Gather Under a Selden Standard—New York Association Placatory, but Los Angeles Defiant.**

Organization of dealers handling cars licensed under the Selden patent, having been applied to Los Angeles and to New York, has been extended to Boston, where a Massachusetts corporation has been formed which is to be known as the Boston Association of Licensed Automobile Dealers. Meanwhile the New York association is getting itself into working shape and is making its peace with the racing interests and with the New York Automobile Trade Association, which has refused to be shelved as a corpse; while the Los Angeles association, on the other hand, is defiantly maintaining its position of ruling "unlicensed" cars out of competition in which its members participate, despite the threats of the contest board of the American Automobile Association.

The officers for the Boston association have been chosen as follows: John H. MacAlman, Columbia and Stearns, president; J. S. Hathaway, White cars, vice-president; F. A. Hinchcliffe, Winton, treasurer, and Chester I. Campbell, secretary. The directors include the officers and J. W. McGuire, J. W. McGuire & Co. (Pierce); J. W. Bowman, J. W. Bowman Co. (Stevens-Duryea and Everitt); S. P. Underhill, The Underhill Co. (Knox); C. F. Whitney, Park Square Auto Station (Alco and Stoddard-Dayton); E. D. Gilmore, Whitten & Gilmore Co. (Chalmers and Hudson), and F. E. Wing, the Marmon agent. The association lists 36 of the licensed dealers, of whom there are said to be about 40 in the Hub.

It is indicated that the licensed dealers are to capture the next Boston show as their own. The fact that Campbell, who has managed the Boston shows in the past, is the secretary of the organization, serves to confirm it, and the program provides that he shall again be the manager, but this time for the association.

The New York Association, to quell the antagonism which was aroused by the proposed restrictions on its members forbidding their taking part in contests or exhibitions where unlicensed cars were permitted, has stricken the following astonishing clause from the by-laws:

"Any member who either directly or indirectly enters an exhibition or competes in a competition with an unlicensed car shall forfeit his membership."

Headquarters have been established in the Thoroughfare building at Columbus Circle, and a temporary arrangement effected by which James M. Carples is to act as general manager of the Association. At the same time the older organization, the New York Automobile Trade Association, has

elected W. M. Haradon, of the Victor Auto Storage Co., as president, to succeed General John T. Cutting, and has added three new members.

**Macauley Becomes Packard's Manager.**

S. D. Waldon having been elected vice-president of the Packard Motor Car Co., of Detroit, Mich., his duties as general manager have been assumed by Alvan Macauley, who resigned the general management of the Burroughs Adding Machine Co. to accept his new responsibilities. Macauley who started as a patent attorney in Washington, was with the National Cash Register Co., of Dayton, O., for seven years before going with the Burroughs enterprise eight years ago.

**Paddock Again Heads Jersey Showmen.**

The New Jersey Automobile Exhibition Co., an association formed originally for conducting the annual automobile show in Newark, N. J., held its yearly election on the 5th inst. George Paddock and Horace A. Bonnell were again chosen as president and secretary-treasurer, respectively, and W. H. Ellis was made vice-president to succeed Dr. James R. English, who is convalescing in California.

**Pittsfield Coil Chooses Officers.**

The Pittsfield Spark Coil Co., of Dalton, Mass., held its annual meeting of the stockholders on the 11th inst., and elected officers. Michael Casey, president, and William P. Wood, treasurer and manager, were re-elected, and William T. Peterbridge was made clerk. The board of directors chosen includes Michael Casey, William P. Wood, Thomas J. Wetzel, Zenas Crane and Charles A. Byram.

**Metzger to Build Huge Truck Plant.**

The Metzger Motor Car Co., of Detroit, Mich., is to build a large separate plant for the manufacture of Hewitt motor trucks, formerly made by the Hewitt Motor Co., which the Metzger company absorbed. According to William E. Metzger, a \$250,000 plant will be built for the purpose, on a 20 acre site which has been selected.

**Empire Invades Indianapolis.**

Another addition has been made to the long list of Empire tire branches, the latest claim to be staked being in Indianapolis. Ind., where salesrooms have been opened at 208 North Delaware street. Charles Weiland presides over the new establishment, which is the first direct factory branch in the Indiana metropolis.

**Cramp Acquires Federal Steel.**

The William Cramp & Sons Ship & Engine Building Co., of Philadelphia, Pa., which in addition to its other activities is conspicuous in the automobile parts trade, has purchased the Federal Steel Castings Co., formerly the Delaware River Steel Co. The plant employs about 500 men.

**GERMANY TOO GOOD TO AMERICANS**

**Official Friendliness in Exposition and Patent Matters Arouses Popular Disapproval—Berlin Project Postponed.**

Not only are Germans annoyed over the fact that the recent patent treaty between the United States and Germany is working more to the benefit of Americans than Germans, but opposition also has arisen to the proposed American exposition in Berlin, which necessitates that affair being postponed for a year, in order that new arrangements may be made for it. In both cases the acts of official Germany in its friendly intent toward American manufacturers have resulted in the displeasure of what may be termed popular Germany, as distinguished from the official.

American manufacturers of motor cars who expressed their intention of exhibiting in the automobile section of the American exposition at Berlin this summer are being advised that the American executive committee of the affair has decided upon a postponement until 1911, when the exhibition probably will be made German-American in character, staging products of both countries, instead of appearing as an American industrial invasion. Members of the committee will visit Berlin in the near future, to negotiate an arrangement of this kind.

The patent treaty, whereby the working of an invention in America gives it the same standing before the German patent office as though it were worked in Germany, has been denounced in the Reichstag as one-sided, inasmuch as the United States does not require its own citizens to work their patents here in order to obtain American protection.

**Adams to Make Automobile Cabs.**

Adams Bros. & Co., of Findlay, O., an established foundry concern, is to manufacture motor cabs. James T. Adams, of the company, has completed negotiations for the purchase of the machinery of an automobile plant now located in Portsmouth, O., which will be removed to Findlay, and stock parts are to be supplied from Chicago.

**Ford Buys for a Detroit Salesroom.**

The Ford Motor Co., of Detroit, Mich., has bought 117 feet frontage on Woodward avenue, at the northeast corner of its intersection with Grand boulevard. It is intimated that the site will be used for one of the largest automobile sales establishments in Detroit.

**Parry May Pull up Stakes.**

The Parry Auto Co. is restless in Indianapolis, Ind., and has permitted it to be known that it may move. Buffalo, N. Y., has been named as the probable future home of the company.

Some Features of the

# White Gasoline Car

which result in unusual  
Economy of Up-Keep

The White gasoline car is designed and built to run at a lower cost of up-keep, mile for mile, than any other car on the American market. Some of the factors which insure economy both in fuel consumption and in cost of maintenance are:

### Intake Gases Heated

By including the intake passages within the block engine casting, the intake gases are heated. As a result, every particle of gasoline is completely vaporized and each cylinder receives a uniform mixture of the proper richness, thus ensuring very low fuel consumption.

### Exhaust Gases Cooled

By water-jacketing the exhaust passages, the temperature of the exhaust gases is reduced as soon as they leave the cylinders. As a result, the pressure of these gases is greatly reduced and there is a minimum loss of power due to back pressure. This factor also results in low fuel consumption.

### Four-Speed Transmission

The direct drive is on third gear and practically all driving in town is done on this gear. For high-speed running, the fourth gear is used. There is, therefore, no racing of the engine and no undue strains upon it when the car is run at high speed. Furthermore, the engine may always be run at very close to its most economical speed.

### Valve Mechanism Enclosed

There is no chance for dirt and grit to work their way into the bearing surfaces and cause wear and faulty timing, as is the case when the valve mechanism consists of a series of external and unprotected springs, rocker-arms, push-rods, etc.

### Accessibility of Every Working Part

The cost of making an ordinary adjustment on any car is determined largely by the accessibility of the several parts. In the White, accessibility has been developed to a much greater degree than in any other car. For example, as there are no external manifolds, or no overhead valve contrivances, a valve may be removed for regrinding without removing or disturbing any other part. As another example, the magneto and water-pump are on opposite sides of the engine and are driven independently, so that either may be reached without disturbing the other.

Write for catalog of the White Steam and Gasoline cars.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, MARCH 17, 1910.

### Confidential Information that is Necessary.

The ways of high finance and the methods employed to impress the stock market frequently are past understanding. Out in Detroit someone has been supplying the newspapers with copies of the quarterly report of the Association of Licensed Automobile Manufacturers, which shows the number of cars manufactured and the amounts of royalty paid by the various licenses, the publication of which easily may be made to serve many and peculiar purposes.

It is information of the most confidential character, and heretofore has been treated as such. On its face, it shows the volume of business transacted by the several manufacturers, and the figures disclose such varying states of activity that their publication is not calculated to serve the interests of all of those concerned, whereas a showing of an apparently overpowering demand for a particular car might help further the sale of stock which the manufacturer might

have for sale and who, with an eye on the ticker tape, has had himself designated as a repository for such stock that he may the better influence the figures which appear on such tape.

The Detroit disclosure of the confidential information is accompanied by a hurrah from the chief camp of the General Motors' trust. The figures "prove," says the hurraher, the great demand for the trust's goods.

But does anyone in the camp desire to deny the report that has been current for some time, that no small part of the "demand" and the consequent shipments have represented cars routed to its branches which represent not sales to agents or to individual buyers, but merely manufactured cars, of which not a few are in storage in various parts of the country?

Confidential information on this point—especially if it appears in print—would be of real assistance to all who incline to purchase shares in any company.

### The On-Coming of Amateurism.

Although the Florida speed carnival and the opening of the Los Angeles board track are of greater and more immediate public interest, from the standpoint of automobile sport, nothing is more significant or holds more hope than the organization of the Amateur Automobile Contest Association and the team contest arranged between the Crescent Athletic Club and the Long Island Automobile Club. Each is an evidence of the on-coming of genuine amateurism—of indulgence in the sport for sport's sake, without which there will be no sport at all when the present great wave of commercialism spends itself.

If the Amateur Automobile Contest Association does not permit itself to be carried away with the idea that because its members are men of means and more or less prominence, it can defy established authority and respect only such rules and conventions as it cares to respect, it is capable of much good influence; and unless the established authority—the American Automobile Association—alters its position and respects the fundamentals of amateurism, the time may not be far removed, when it may become advisable and necessary to use the Amateur Automobile Contest Association as the foundation for a truly national amateur governing body. The present A. A. A. rule is not an amateur rule at all. It is in direct conflict with the rule that has obtained in practically all of the older and

long established sports in that it forces amateurs to compete with professionals and thereby jeopardize their standing in all other sports, and it unfairly and automatically discriminates against and professionalizes the men of one particular profession or industry.

The true sportsman does not ask odds of or run away from any man, no matter what his profession, and the act of making or selling an automobile, a tire or a spark plug or the holding stock in a company making or selling such goods does not and cannot make a man any more expert in driving an automobile than the manufacture or sale of shotguns makes a man engaged therein an expert or professional marksman. Every sportsman or alleged sportsman must be weighed on his own merits and be judged by his individual acts.

The stock brokers and others who comprise the Amateur Automobile Contest Association have need to learn this lesson. The A. A. A. already is old enough to have learned it, and if it does not heed it ultimately it may have occasion to reap a harvest of barren regrets.

### Dabbling that Courts Danger.

As is apt to be the case when any new art or process is introduced, certain unpleasant possibilities may attend the use of the autogenous welding process by careless and ignorant workmen unless extraordinary measures of precaution are taken by those who undertake the design and production of the special apparatus which is necessary. But entirely beyond their control is a certain peril which oddly may arise from the general and successful adoption of the oxygen burner under conditions which are properly safeguarded. For with the growing confidence of manufacturers and repairmen in a system which is thoroughly practical in its nature when correctly handled, there is an inevitable tendency for dabblers to experiment with home-made and more or less extemporaneous plants and under circumstances which render operation far from safe. This tendency, indeed, already has begun to manifest itself to the extreme disgust and alarm of some of the manufacturers of welding systems.

An illuminating instance in point came within the experience of one firm which specializes in welding outfits for garage use. Through a skeptical inquirer, who had been regarded in the light of a potential customer, it was learned that an acquaintance of his had had various spectacular and more or

less dangerous accidents while using the vendor's system. As the latter had been particularly watchful of all systems sent out, and had heard of no accidents of the sort described, he was especially interested to learn more of the troubles of the friend, and ultimately discovered that the difficulty had arisen as a result of using an acetylene generator of the sort designed and built exclusively for car lighting purposes in connection with compressed oxygen. A light portable generator, unprovided with flow regulator or anti-blowback safeguards, ensured ideal conditions for accident. And it developed that the friend had grown thoroughly accustomed to having his generator blown up without warning, and was equally accustomed to reassembling it and going on with his interrupted work.

Such instances are as much to be deplored as they are certain to continue for a time, until garagemen of the foolhardy sort have learned that, like nitroglycerine and other high explosives, the oxygen flame is safe to handle only under certain restricted conditions. Such conditions, are thoughtfully provided by the manufacturers of autogenous outfits, whether of the oxy-acetylene or oxy-gasolene order. Furthermore, most producers of such apparatus are watching over their customers to the extent of keeping track of their experiences, and glean all possible information in regard to the advantages and shortcomings of their own and over their customers to the extent of keeping other systems. Their activities in investigating the causes of all accidents which occur is a particularly important effort which is deserving of every encouragement.

Just so long as oxygen gas is used in connection with such impetuous compounds as acetylene, hydrogen, gasolene vapor or any of the other gases which are applicable to the high temperature combination flame or to the autogenous flame, there will be some danger to the heedless operator. It also follows that occasional mishaps arising from abuses of one sort or another, will continue to cast more or less suspicion upon the entire class of operations. But so long as those who are responsible for their development continue to protect them to the best of their ability, the public, and more particularly the trade to which their success is of vital interest, should regard with tolerance any mishaps which occur and should do their best to submit to and assist in the educational work which is necessary to the successful introduction of what must be con-

sidered one of the greatest and most useful implements which has yet been brought within the reach of the automobile manufacturer and repairman.

#### More Light to Suppress Dazzle.

From the layman's simple-minded point of view, the essence of homoeopathic doctrine is, "for a condition symptomatic of poisoning, administer more poison of a sort which ordinarily would produce like symptoms." Somewhat the same sort of logic is that which induces an overseas authority to suggest as a remedy for glaring headlights, not a reduction in the offending light, but increased illumination of immediately surrounding objects. Ridiculous as the idea appears at first thought, its basis of reason is apparent so soon as the mental optic becomes accustomed to the glare of the apparent contradiction.

Light values are measured only in a relative sense by the human eye; and mainly in terms of surrounding values; the proverbial and historic rush light is of more value in the gloom of a sub-basement than a high power Nernst lamp on a roof in broad daylight. So it is true that the painful sensation accompanying the sudden apparition of a gas headlight in the midst of a lonely road on a dark night is due in large measure to the dead black contrast of the surroundings. Hence, the proposal to diffuse a measure of side and down light effect is reasonable to the degree that besides reducing the contrast it would define the approaching vehicle to the wayfarer. Complaints against the glare of headlights in illuminated city streets, enforced by law in many instances, are proof positive that the measure would be a palliative rather than an absolute remedy, however.

The stern move which was made by Chairman Butler, of the contest board of the American Automobile Association, in promptly suppressing the heralding throughout the country of results of the unofficial Florida time trials as "records," is a most commendable one. The annals of automobile racing have been badly blotted with offensive press work of the sort and it was high time for the situation to be taken boldly in hand. With the establishment of this absolute precedent in motor racing control it is to be hoped that a final check will be placed upon the broadcast advertisement of unsupported claims for honors which are unearned and which serve only to confuse.

## COMING EVENTS

March 14-19, Fort Worth, Tex.—Fort Worth Automobile Dealers' Association's first annual show in Coliseum.

March 15-19, Syracuse, N. Y.—Syracuse Automobile Dealers Association's annual show in State Armory.

March 14-19, Cedar Rapids, Ia.—Automobile show in Auditorium.

March 17-19, Louisville, Ky.—Louisville Automobile Dealers Association's annual show in Armory.

March 19, Altadena, Cal.—Annual Pasadena-Altadena hill climb.

March 19-26, Aberdeen, S. D.—First annual automobile show.

March 20, San Francisco, Cal.—San Francisco Motor Club's hill climb on Nineteenth avenue hill.

March 21-26, Spokane, Wash.—Spokane Automobile Dealers' Association's first annual show in Princess Rink.

March 22-24, Daytona, Fla.—Florida East Coast Automobile Association's eighth annual beach speed carnival.

March 26, Atlanta, Ga.—Atlanta Journal & Fulton County Automobile Club's joint hill climb.

March 26-April 2, Montreal, Can.—Fourth National Automobile and Sportsmen's show.

March 26-April 2, Pittsburg, Pa.—Pittsburg Automobile Dealers Association's fourth annual show in Duquesne Garden.

March 28-April 2, Indianapolis, Ind.—Indianapolis Automobile Trade Association's first annual show in individual show rooms.

March 28-29, Savannah, Ga.—Savannah Automobile Club's 675 miles endurance run to Jacksonville, Fla.

April 9-16, Elmira, N. Y.—Elmira Chamber of Commerce's first annual automobile show.

April 5-6, Amarillo, Tex.—Amarillo Automobile Association's race meeting.

April 8-17, Los Angeles, Cal.—Inaugural meet on the new Los Angeles Motordrome.

April 11-18, Springfield, Mo.—Springfield Chamber of Commerce's first automobile show.

April 18-23, Bangor, Me.—Second annual automobile show in Auditorium.

April 30-May 1, 2, Philadelphia, Pa.—Quaker City Motor Club's roadability run.

June 11, Wilkes-Barre, Pa.—Wilkes-Barre Automobile Club's annual hill climb on Giant's Despair, Wilkes-Barre Mountain.

July 2, Wildwood, N. J.—North Wildwood Automobile Club's roadability run from Philadelphia to Wildwood.

July 4, Wildwood, N. J.—North Wildwood Automobile Club's annual beach races meet on Ocean drive.

## Three More Local Shows Occupy the Stage

GENERAL VIEW OF DES MOINES SHOW IN THE COLISEUM

### Success of Des Moines Show Induced an Extra Day

Despite the surfeit of counter attractions in the form of numerous state conventions of agriculturists, good roads delegates, prohibitionists and advertising men which were held in Des Moines, Ia., last week, they did not overshadow or detract from the popularity of the first annual automobile show ever held in the capital city of the Gumbo State. The initial function was staged in the Coliseum, the city's largest building, and was sponsored by the Des Moines Automobile Dealers' Association.

Ushered in with an automobile parade which included nearly every available car in the city, the exhibition was favored with good weather throughout the week, which good fortune contributed largely to the healthy attendance. So great was the interest manifested as exemplified by the

daily increasing attendance, that the management continued the show to the end of the week—one day beyond the schedule.

It was the largest motor show ever held in the state, over 50 exhibitors taking space, and 125 cars of 32 different brands were shown. Following the dictates of fashion of the present season in the matter of decorations, the setting was of the outdoor variety. Green tracteries of ivy, sprigs of greenery and leafy bowers ran riot through the hall, while overhead floated masses of bunting in hues of white, green and yellow, the association's colors:

The exhibitors were the following:

Gasolene cars: Patton-Van Vliet Automobile Co., Abbott-Detroit, Mora, E-M-F. and Flanders; Cruzan & Co., Cartecar; Iowa Auto & Supply Co., Locomobile,

Chalmers and Hudson; Racine-Sattley Co., Firestone-Columbus; Sears Automobile Co., Reo, Mitchell, Oldsmobile and Thomas; Hub Motor Co., Kisselkar; Ideal Auto Co., Overland, Haynes and White; Means Auto Co., De Tamble and Moline; T. E. Dyson & Son, Oakland; Capital City Carriage Co., Fuller and Jackson; Riddell Automobile Co., Buick; Forest Avenue Garage and Hardware Co., Pope-Hartford and Franklin; Herring Motor Car Co., Ford; Capital Auto Co., Maxwell and Regal; Dukehart Machinery & Automobile Co., Everitt.

Electric vehicles: Iowa Auto & Supply Co., Woods; Strong Motor Car Co., Baker; Racine-Sattley Co., Columbus; Ideal Auto Co., Waverley; Capital Auto Co., Detroit; Patton-Van Vliet Co., Studebaker.

Motorcycles: F. R. Jenkins, Indian.

### Bridgeport Does Itself Proud on Short Notice

Conceived and informally discussed but little more than one short month ago at a joint meeting of the local dealers and motor-

ists, the first automobile show ever held in Bridgeport, Conn., and which may become an annual fixture, was inaugurated in the

State Armory on Tuesday, 15th, under the auspices of the Bridgeport Automobile Dealers' Association, Inc., and will continue

for the balance of the week. For the initial effort of an association scarcely a month old it is an exhibition of which its sponsors well may feel proud.

Every member of the association—and that includes every dealer of importance in the city—has taken generous space, there being 23 exhibitors, of whom 19 display cars of 37 different makes and in over 50 types. There was no difficulty in disposing of all available space among the local dealers and several out-of-town requests had to be denied.

After visiting several other shows, the committee evolved a decorative scheme which has given to the building a more brilliant and attractive garb than it has worn in a long time. White and green bunting is the predominating color and is strung about in profusion, while American flags are freely used to add to the beauty of the

scene. In the spaces the floor is covered with green cloth and for indicating the dividing lines between exhibits tape laid across the floor covering is used, instead of the usual and more conspicuous railing. Powerful lights scattered about the hall give a brilliant illumination. Of music there is a plenty, a band and orchestra alternating in the afternoon and evening. All of the booths have uniform signs bearing the name of the exhibitor and the cars shown, the letters being white on a maroon background.

The exhibitors and the cars they show are the following:

Gasolene cars: Regal agency, Regal; Peck & Lines Co., Paterson and Whiting; Franklin garage, Halladay; Auto Repair Co., Knox; Mitchell agency, Matheson and Mitchell; Fairfield Auto Co., Overland, Premier, White, Marion and Rambler; Consolidated Motor Co., Winton, National, Jack-

son and Empire; Bull's Head garage, Franklin and Crawford; Lyford Bros., Oldsmobile and Oakland; Buckley's Auto Station, E-M-F., Flanders and Corbin; Miller Motor Car Co., Maxwell and Chalmers; Aston Motor Car Co., Pary; Motor Car Co. of Connecticut, Pullman; Rantz Motor Car Co., Cadillac, Midland and Speedwell; Edwin Jennings Co., Stevens-Duryea and Haynes; Blue Ribbon garage, Packard; Pyramid Motor Co., Pope-Hartford and Buick; Liberty Cycle Co., Velie; Park City Motor Co., Peerless.

Motorcycles: Excelsior Auto Co., Excelsior Autocycle; Bridgeport Cycle Co., Indian; Liberty Cycle & Motor Co., Harley-Davidson and M.M.

The accessory exhibitors, of whom there are but three, are the Post & Lester Co., Blue Ribbon garage, and Liberty Cycle & Motor Co.

## Syracuse Show Draws Record Breaking Crowds

In accordance with the procedure followed by other cities on the show circuit, to Mayor Edward Schoeneck was accorded the honor of pressing the indispensable button which inaugurated the second annual automobile show of the Syracuse (N. Y.) Automobile Dealers Association in the state armory on Tuesday evening, 15th inst. Occupying every available inch of space on the main floor and in the basement, the thirty odd exhibitors filled the building to its capacity with their wares, and several firms were unable to secure any space to show their cars. Car exhibits, of course, are in the majority, with 21 displays, comprising 47 different makes. As Syracuse is the home of a great many gear making concerns, it is but natural that there should be a strong showing of these components in the accessory division.

Swathed in hundreds of yards of bunting, in hues of white, yellow and blue, the association's colors, the spacious hall presents a very attractive appearance. To add to the beauty of the scene streamers of green and red poppies are strung between the roof girders, while palms, ferns and potted plants are placed artistically about the hall. Il-

luminated signposts indicate the location of the various exhibits, while pedestals placed at intervals along the aisles and topped with palms, also bear the names of cars. Illumination is furnished by strings of innumerable incandescent lamps strung from the roof girders.

The main floor is given over entirely to cars which are arranged along the side walls and a double row in the center of the arena, the latter section being bordered by aisles on all four sides. In the basement are found the commercial vehicles, the entire car strength being about 75. Each night has been set aside in honor of various local civic and social bodies, when special entertainment will be given. Being situated not far from the home of Glenn Curtiss, it was an easy matter to secure an aeroplane, which is the cynosure of all eyes. Another feature which vies with the ethereal vehicle is the display of numerous trophies by the National and Maxwell representatives. From the opening night all previous attendance records were shattered, and when the show closes on Saturday night it is safe to say that the total number of visitors will far exceed that of last year.

Following are the exhibitors:

Gasolene cars: Amos-Pierce Auto Co., Lozier, Stevens-Duryea, Chalmers and Hudson; Willis Motor Car Co., Oldsmobile, Oakland and Rapid trucks; Kerr-Doane Motor Co., Velie and American Simplex; Strait & Shaw, Buick; W. King Smith Co., National, Palmer-Singer and Simplex; Syracuse Motor Car Co., Winton, Pullman and Ford; George J. Arnold Co., Thomas, Inter-State and Cartercar; Central Auto Sales Co., Regal and Selden; T. E. Fitzpatrick, Whiting; Fred A. Marshall, Hupmobile and Koehler; Maxwell-Briscoe-Syracuse Co., Maxwell and Columbia; Franklin Automobile Co., Franklin; Edwin C. Ide, Klinekar, Stoddard-Dayton and Courier; C. A. Benjamin, Inc., Packard, Haynes, Studebaker, E-M-F. and Flanders; Kane & Roach, Gaeth and Brush; Genesee Motor Car Co., Cadillac and Peerless; Christ Motor Car Co., Overland and Marion; Charles E. Wethey, Reo; Clinton Auto Co., White and Stearns; D. F. Hubbell, Marmon and Royal Tourist; Chase Motor Truck Co., Chase.

Electric vehicles: Central Auto Sales Co., Baker.

Motorcycles: Krause & Heil, R-S.

### Grand Rapids Road Race Abandoned.

Grand Rapids, Mich., will see no automobile road race this year, after all. Lack of interest on the part of members of the local club and dealers who were expected to cooperate in the promotion of the event is responsible for the abandonment of the contest. Tentative plans for the race had been outlined and a course prospected, and while there was a general indorsement of the project public support never grew to proportions where there were more than four or five of the original boosters who were willing to undertake the burden of responsibility which the affair involved. Two or three efforts to incite enthusiasm were

unsuccessful, hence the decision to let the project go by the board.

### To Preserve the Bonnet Finish.

Motorists who are particular about preserving the finish of their cars should pay particular attention to the condition of the hood and front mud guards after a run in wet weather. As the bonnet is heated to some extent, rain and mud splashes will dry quickly upon it leaving spots which are practically unremovable. If it is impracticable to wash the car as soon as it is brought in after a wet run, it is well to rub down the hood with waste, afterward drying it with a piece of chamois leather.

### Milwaukee's Wheel Tax is Killed.

Due to the vigorous opposition displayed by the Milwaukee (Wis.) Automobile Club, the ordinance introduced into the city council imposing a wheel tax on all vehicles, to raise funds for street improvement has been killed. The committee on judiciary, to which the measure was referred, recommend its indefinite postponement, and a motion was passed by the council assenting to this disposition of the matter. Thanks to their watchful and aggressive club, Milwaukee motorists have escaped for the present at least, having to pay wheel tribute as do their less fortunate brethren in Chicago and Washington.

## NEW YORK'S NEW LAW TAKES SHAPE

**Permits 30 Miles an Hour and Otherwise  
is Fairly Liberal—Non-Skid Clause  
is "Doctored."**

After much backing and filling, the much-confused legislative situation in New York at last has cleared. The several bills which had been introduced finally have been sifted and the best features of each incorporated in the measure proposed by Assemblyman Callan, of Columbia county, a hearing on which was held on Thursday last. Charles Thaddeus Terry, chairman of the A. A. A. legislative board represented the automobile interests, and ably, as usual. In a letter to the Motor World, Assemblyman Callan states that the bill probably will be further amended before final passage and intimates that the clause affecting the use of non-skidding devices will be one of those subject to amendment. The original clause, as the Motor World pointed out last week, would have legislated out of use a number of non-skid tires, but due to influence from Niagara Falls, it already has been altered, but whether the alteration serves the purpose is not wholly clear. It now reads as follows:

No person shall operate or drive a motor vehicle on any of whose wheels is a tire chain or a non-skidding contrivance or tire composed in whole or in part of metal (which are used exclusively for non-skidding purposes), except when such highways are wet or slippery or covered with ice or snow.

The words in parenthesis represent the amendment to the original clause.

For the present system of permanent registration, the law substitutes annual registration which must be renewed on the first day of August of each year. Fees are \$5 for 25 horsepower, or less; \$10 for more than 25 and less than 35 horsepower; \$15 for more than 35 and less than 45 horsepower; \$25 for more than 45 horsepower. Vehicles to be used solely within the confines of a city will pay only \$2 annually. If application for registration is filed after January 1st of the year, a reduction of one half of the fee shall be allowed. Fees will be considered in lieu of taxes, general or local, to which motor vehicles may be subject. Non-resident owners are exempted. Number plates, the color of which will be changed annually, must be displayed front and rear.

Manufacturers and dealers will pay \$15 a year for a general registration of all their cars, and one dollar additional for each registration plate affixed to such cars. Cars so marked shall not be operated for private use or for hire.

Cities and incorporated villages are permitted to make special speed regulations, provided they do not require a speed less than 15 miles per hour, but a greater speed

over a distance of one-eighth of a mile will be presumptive evidence of careless driving. Elsewhere the speed shall be "careful and prudent," but "a rate of in excess of 30 miles an hour for a distance of one-fourth of a mile shall be presumptive evidence of driving at a rate of speed which is not careful and prudent." Cities and towns must erect signs showing where their speed limits begin and end.

The chauffeurs' registration fee is fixed at \$2 annually; his application must be sworn to before a notary public or justice of the peace; he will be provided with distinctive badge to be worn openly when driving a car; loaning badge to another person, or wearing fictitious badge is punishable by fine of \$50. Unregistered chauffeurs cannot drive motor vehicles.

Using or tampering with a motor vehicle without permission of the owner is a misdemeanor, punishable by fine up to \$100, or imprisonment up to six months, or suspension of license for six months, or any two of these penalties combined.

Drivers arrested for violation of the law shall be given an immediate hearing before the nearest magistrate, justice of the peace, captain or sergeant of police; if such hearing cannot be had, a bail bond not exceeding \$100 shall be executed. If the arrest was caused by a violation of the rules relating to the driving of cars while under the influence of liquor, or running away after an accident, the bail bond shall be in an amount not exceeding \$1,000. The penalty for these offenses is one to five years imprisonment and suspension of revocation of license or registration. If the prisoner is owner of the car he may leave same as bail; if he is not the owner, but can obtain the permission of the owner to do so, he may deposit the car in lieu of a bond or cash.

Penalties for exceeding the speed limit are fixed at not more than \$100 for the first offense, a fine not exceeding \$100 or imprisonment for not exceeding thirty days, or both, for a second offense, and by a fine not exceeding \$250 and imprisonment not exceeding thirty days for a third and subsequent offense. A person violating this rule may in addition be indicted, and the Secretary of State shall upon a third conviction forthwith revoke the license of a chauffeur; no new license will be issued to such offender within six months after such conviction, in the discretion of the secretary of state. If applicant for license makes false statements he shall be fined not exceeding \$50.

All registration fees, penalties, and fines collected from automobile owners and drivers shall be used for the maintenance of public highways.

Toll rates for motor vehicles on bridges and turnpike roads shall not exceed the rate charged for vehicles drawn by two animals, excepting automobiles designed to carry but two persons, which shall pay the rate scheduled for vehicles drawn by a single animal.

## OLDFIELD'S MILE "FASTEST EVER"

**Does 27.33 Seconds in Official Trial on Florida Beach—A. A. A. Squelches His Preliminary "Press Working."**

Through the breaking of a piston in a practice trial of Ralph De Palma's 200 more or less horsepower Fiat at Daytona, Fla., on Saturday, 12th inst., the widely heralded match between De Palma and Barney Oldfield, with a Benz of similar power, scheduled for Tuesday of this week on the beach, was called off. The accident which contributed another addition to the numerous mishaps which have befallen Fiat cars on the seaside course in previous years is said to have been caused by the overheating and seizing of a piston. As there were no spare parts in the country, the car being specially built, it was impossible to effect repairs and the disabled flier was shipped back to New York. In contrast to the ill-luck which befell De Palma, Barney Oldfield and his Benz seemed to have been favored with the best of good fortune, as is illustrated by the crop of "world's records" which his resourceful manager, "Bill" Pickens, scattered broadcast in the press.

With unofficial timing Oldfield was credited with several miles under the record of 0:28½, made by Fred Marriott four years ago. When these "phony" records came to the attention of Chairman Butler, of the A. A. A. contest committee, he promptly wired the Oldfield-Pickens aggregation to desist from sending out further reports of unofficially timed trials under penalty of suspension, as they were of a misleading nature. He also revoked the sanction for official trials until the opening of the annual meet next week, but later on the representations of the officials of the Florida East Coast Automobile Association that a large crowd was on hand, he rescinded his revocation and granted permission for Oldfield to go against the straightaway marks on Wednesday (16th), under official supervision and timed by the Warner electrical apparatus.

On that day (yesterday), Oldfield traveled faster than man ever traveled before, by sending the Benz over the Official mile course in 27.33 seconds from a flying start, establishing a new straightaway world's record. It averages 131.72 miles an hour. Returning to the starting line Oldfield tried for the standing mile record of 41.23, made by Hemery, and got it. He reduced the Frenchman's figures to 40.53 seconds. With De Palma as official representative of the contest board, and a surveyor's certification of the accuracy of the distance it only remains for the contest board to accept the records to confirm their authenticity. The only other trial was made by David Bruce-Brown, the erstwhile "amateur," who "flew" the mile in 32.18 seconds.

## SHOWS THE ROAD TO EASY MONEY

Alluring Presentation of One Phase of the Automobile Business—How Naughty Husbands Help.

Although the day is almost past when it is possible to sell old second hand foreign cars to gullible purchasers at enormous figures, as the most advanced European models, and although values for both new and second hand cars of all makes have become more standard and better known, there still appear to be golden opportunities in the buying and selling of second hand cars that the ordinary man does not realize, but which are revealed in the course of a highly unusual effort on the part of an advertiser in the New York newspapers to raise capital in order that he may expand in the second hand business. His extraordinary effort, while calculated to coax money out of the pockets of many small investors, is chiefly interesting as showing how glowing a presentation of the second hand car business can be devised, especially when the "inside information" element is injected, with stories of wealthy women and their troubles with joy-riding husbands.

Under a big heading of "Automobile Opportunity," the advertiser declares in his opening, "With the entire nation car-mad, and even farmers now buying cars, a special opportunity in automobiles is not to be sneezed at." From which point he proceeds in part as follows:

"I am in a position to get information when a car is likely to or going to be sacrificed several hundred dollars below its ordinary market price.

"I know a party, who being sued for divorce, is quietly disposing of his personal holdings at very low figures. I know another, who has a second mortgage coming due that will have to be paid by selling his fine car at heavy sacrifice. I know of another car owned by a wealthy lady, whose husband has been joy riding with other women; this lady is going to sell this car quickly and quietly, if she has to accept only \$500 for her splendid car, that is worth at least \$3,000.

"What would you think of a 1907 — at \$700? I had an opportunity to buy one at \$700—could have sold it next day for \$1,500. I couldn't get the cash in time to buy it and had to let it pass. I had to let a 1909 — at \$1,200 pass the same way, for the same reason; that car would have brought \$2,500 in a few days.

"In proportion to the amount of money invested such deals are quicker and more profitable and safer than real estate or anything else I know of. Unlike real estate, a quick market is always readily found for good cars properly bought.

"If you have money available or lying idle or in savings bank, earning practically

nothing, it will certainly pay you to get in touch with me and make my acquaintance, and co-operate with me. Co-operation is the strongest force known to the business world.

"Do not hesitate to communicate with me, fearing that possibly I have tied up to and closed with some one else, for my facilities for getting hold of these good things are such that I could sometimes keep several small investors busy making big money quickly.

"I recently bought a car for \$500, and made \$700 profit on it the same day. I bought another car for \$1,250 and held it twenty days and made \$1,000 profit. I bought another for \$1,000 and sold it for \$2,000 in three days.

"To a bona fide investor, wishing to investigate these deals closely, I will show bills of sale, and he can call on both purchaser and seller for verification.

"I am figuring on a number of cars that are going to fall into my bag just as these others did, and I shall need one or two or more small investors to co-operate with me to carry the cars. If you contemplate coming in with me you had better first get acquainted. Then, investigate me and see if I am responsible and honorable. It's easy to learn if a man is square. Then when the axe is ready to drop, we shall both be ready; you with the money and I with the car.

"Within the next few days I have got to pay \$650 for a car that I shall sell for \$1,500 very quickly. I would like to have a small investor buy this car for our joint profit—he carrying it in his own name. I pay all the expenses of selling and garaging. The investor has nothing to worry about; he is in at such a low price that he could turn it into cash in half an hour any time.

"The investor can't lose any more than by buying Herald Square property at \$500 per running foot. I am no millionaire and no pauper. If I do not get \$650 in time to pay for this car or find some one to co-operate with me, I shall have to sacrifice on some other securities for cash, or let this splendid opportunity pass. The car is held by a sole executrix, who is not posted on values, and is anxious to close up all personal estate quickly and move to another city with her relatives.

"If you want to get in touch with a live 'earning capacity,' get acquainted with me. If you are too late for this deal there are others equally as good coming along—once you get a nibble of one your appetite will be ravenous for more."

### Motor Cars as Switch Engines.

Rarely is the motor car called upon to do the work of a steam railroad engine, but at some factories the automobile has been found an excellent substitute for use in shifting freight cars when the regular engines are unavailable. When this new adaptability of the motor car becomes more widely known, there is a possibility of its being taken advantage of at many plants.

## PARTS MAKERS OVERDO ACCURACY

Some Makers of Small Cars Would Prefer Less Exactitude in Size—Difficulties in the Assembling.

That the extreme accuracy with which a number of the better established parts makers turn out their products is responsible for considerable extra expense to the builders of cars who depend in large measure upon the assemblage of parts from outside sources, was the astonishing declaration of a well-known automobile engineer recently. As practically all American makers to some extent rely upon the parts specialists in completing their cars, the difficulty referred to is one which is of no little importance, although at first sight it appears to be trivial.

"While it is customary to work to very close limits in producing high priced cars, such close accuracy is not so essential in the smaller and cheaper machines," explained the engineer in question. "The point is that to narrow down the limit of accuracy—the 'tolerance,' as it is known in engineering parlance—means that with a cheap product, where rapid automatic processes are relied upon, either a considerable number of parts must be rejected or else hand fitting must be resorted to. The only alternative, and the method which is used in high priced cars, is to grind the parts to exact size; but this is an expensive step in the manufacturing process, which can be omitted in many instances where it is desired to reduce costs as far as possible.

"When the parts maker turns out his bearings, his crank shafts or his gears to limits much finer than can be followed economically with the low grade product, the natural consequence is that the corresponding parts must be finished measurably below size and then enlarged by hand in the assembling process. If there were a greater amount of variation in the complementary dimensions of the stock parts, more rapid and—from the assembler's point of view, satisfactory—results might be obtained by a simple process of selection or matching up of parts.

"I do not mean to deplore the high development which the parts business has reached, by any means," he concluded. "But I do mean to say that some of the small car builders would be better satisfied if it were possible to procure equally satisfactory stock parts constructed to wider limits, or to be specific, to the same limits that we impose in carrying out our work. These are sufficiently close to guarantee the proper relation of the parts which we build ourselves, though they are not so close as those which may be required for the large machines of more expensive quality. It is all a question of 'fitting allowances' which, as every machinist knows, cannot be too close in theory, but in practice require considerable latitude."

## HERE'S THE "ONE-STROKE" ENGINE

Its Inventor so Terms It, but It's of Two-Cycle Principle—Its Design and Operation.

By dint of much mechanical ingenuity a two-cycle engine design has been evolved in England, to which, by an equally laborious stretch of the imagination the term "one-stroke" engine has been applied. As recently mentioned in these columns, the idea involved is nothing more nor less than that of combining two two-cycle engines,

VIEW OF "ONE-STROKE" ENGINE

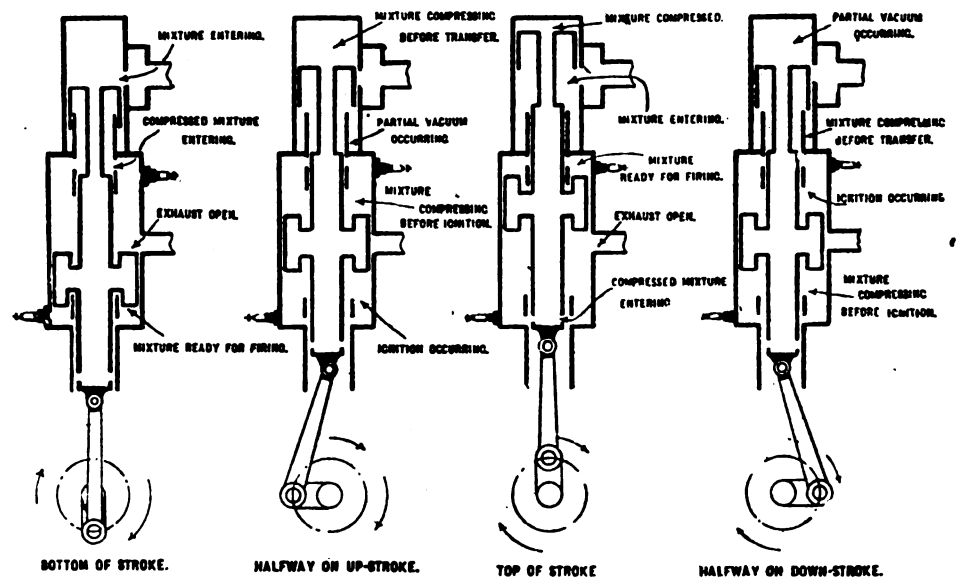

each having independent cylinder compression, instead of the more usual crank case compression, the combination being arrived at in such a way that the power producing element in the combination is double acting, while the mechanism is valveless in operation. The result is an extremely ingenious and somewhat promising motor from which, unfortunately, no actual test results as yet are available, though it is stated that the model engine already has afforded satisfactory demonstrations.

Full particulars of the engine, which now are available, reveal that it is the invention of Messrs. G. Enderby and H. Johnson, the latter being proprietor of Johnson's garage, Harrogate. The accompanying illustrations show the general construction employed, and also in a diagrammatic way depict the successive functionings of the two compression and working cylinders at intervals of 90 degrees throughout one complete cycle, which thus occupies two full strokes of the piston.

The essential elements of the mechanism are two cylinders of different diameter, superposed; the smaller one, in which compression of the charges occurs, being above the working cylinder. The pistons are formed of a length equal to the stroke minus the width of the central port in each case. Thus, in the upper cylinder, at the end of each stroke a charge of gas is inducted through the port A, into one end or the other, according to the direction of piston movement. Similarly at the end of each stroke, the row of exhaust ports D is uncovered by the lower piston, thus releasing the waste gases to the muffler. The central member, corresponding to the piston rod of the normal engine, is tubular, the upper section being enlarged at the point where it enters the compression cylinder and car-

ing piston, thus permitting the exhaust to escape coincidentally with the intake movement.

The interchange occurring at the upper end of piston travel, is hardly more complex, though considerably more circuitous. When the piston reaches the limit of its upward travel, it is evident that the incoming gas is compressed into the interior of the hollow piston rod, the cavity within that member extending clear through to its base. At the same time the ports C, which are drilled in the lower end of the piston member, register with the corresponding ports B<sub>1</sub>, which are cut in an upwardly extending sleeve formed in the main cylinder casting. Coincidentally, the lower edge of the working piston exposes the exhaust ports D in the cylinder wall, thus permit-

DIAGRAMMATIC REPRESENTATION OF "ONE-STROKE" CYCLE

rying packing rings, which thus serve the purpose usually fulfilled by a stuffing box. The lower end of the piston group is similarly equipped.

The essential idea of the invention, it will be observed, is expressed by the method by which the compressed gas is transferred from the compression to the working cylinders in order to carry out the cycle. From the lower end of the compression cylinder to the upper end of the working element, the transfer is readily accomplished by means of the port B, which is uncovered at the lower end of piston travel by the piston itself. The ports are in a sleeve which surrounds the piston at that point, and passageway for the gas is secured by reducing the piston diameter at its upper end. Obviously, whenever the piston reaches the bottom of its stroke, the compression piston has condensed the inward bound charge to the required degree in the annular space between the hollow piston rod and the sleeve which forms the cylinder closure at the upper end of the working element; the intake ports B are uncovered, permitting the gas to flow into the working cylinder; and also the exhaust ports D are uncovered by the work-

ing the waste gases to escape while the intake is occurring.

The two sets of operations thus described separately, of course, occur simultaneously in practice, so that the working of the engine is continuous and analogous to that of an ordinary two-cycle engine having two cylinders, with independent cylinder compression and working cranks set 180 degrees apart. The diagrammatic illustration of its performance is practically self-explanatory.

It should be mentioned that the construction adopted involves a considerable increase in overall height over that of the common type of standard engine. In the first engine of the sort to be constructed, the total height is something like 3 feet. The stroke is 4 inches and the diameter of the lower or working cylinder is 5 inches. As the effective area of the working cylinder is equal to the difference between the total cylinder area and the sectional area of the central piston rod, however, the net diameter is only equivalent to 4 inches. From this it will be seen that, despite the impression conveyed by the diagrams, the central member is not of relatively large diameter, but is more nearly in effect a

tubular passage, being only an inch or so in diameter. By this means, the compression at the upper and lower ends of the upper cylinder is equalized and the effective pressures on the working piston thus equated in a way which is not apparent from the two illustrations here presented.

From the method of introducing one set of charges through the piston rod and hence directly through the cylinder interior, an unusual measure of cooling efficiency is claimed, though the tendency to weaken the incoming charges to the lower end of the working cylinder as a result of imparting a considerable amount of heat to the fresh charges is not dilated upon by the inventor, nor the probable tendency to uneven firing at the two ends in consequence of the unequal pre-heating of the charges which might be supposed to result from their evidently different methods of treatment.

Despite these criticisms, however, the invention introduces considerable novelty both as a power unit and as a mechanism. Not the least important of these is the fact that the machine as above described, in number of impulses per minute is calculated to replace the standard four-cylinder motor of 4 by 4 inch cylinder dimensions, and that, despite the increased total height, the cubical space requirements of the motor are much less than those of the standard engine. Unfortunately, it is impossible to complete the comparison at this time, by giving the power output of the new unit.

#### Society's Anti-Smokers Have an Inning.

On Friday of last week E. S. Cornell, like a dutiful jockey, again mounted Henry Clews's pet hobby, the so-called National Highway Protective Society, and rode it into the New York City Hall. The occasion was the public hearing on the pending ordinance which proposes a fine of \$10 or five days in jail, or both, on any person who permits a motor vehicle to "emit offensive quantities of smoke, gas or other disagreeable odors from the exhaust or muffler." Mr. Cornell did not do any talking, but previously he had photographs in evidence and they proved that some automobiles do smoke sometimes. An alderman, however, did lots of talking. He said the "blue haze" which he says exists in the automobile district is due to the smoke, and told how merchants had to keep their doors and windows closed to protect their goods. Some other men also spoke, and of course, two club women; for nowadays every self-respecting promoter or "accelerator of public sentiment" knows how easy it is to get club women to espouse and to spout about any old thing. One of the ladies pleaded for the passage of the ordinance for the sake of the eyes and noses of the little children. Nobody really opposed the measure; and no one asked whether, if it is passed, it will not be at variance with the state automobile law.

## DEPARTURE IN AUTOMATIC CONTROL

### Hoyt Employs a New Idea in Multiple Jet Carburetters—Unusual Effect Obtained in the Main Jet.

In carburetter design, it is interesting to observe the rapid growth of the multiple jet idea, if for no other reason that because it tends to keep the carburetter problem constantly in the public eye, as is bound to be the case whenever two or more different theories are exploited in the same field. A

SECTION OF HOYT CARBURETTER

recent development in this line, is the invention of F. C. Hoyt, of Jamaica Plain, Mass., who has just placed it on the market. Its special features are a low speed jet which is continuous in operation, and a main or

TOP VIEW SHOWING CONTROL

high speed jet which is thrown into action automatically in response to increased suction and which is governed synchronously with an air-controlling valve.

The general construction of the instrument is revealed by the accompanying illustrations which show both sectional side, and exterior top views. As will be seen from the sectional view, the two jets lie side by side, but differ in that while the slow speed member is of normal construction and controlled by the familiar needle valve, the main jet is in the form of a plain circular nozzle with a plunger rod fitting it closely, which is flattened on three sides. As the plunger is withdrawn from the opening it is apparent that what amounts to three sprays are discharged, the rate of flow be-

ing proportional to the movement of the plunger rod away from the closed position.

Air regulation is accomplished by means of a piston valve which is cut away at its base to permit a fixed amount of air to flow at low speeds, the rush of this small discharge over the low speed nozzle creating the necessary lifting effect to produce the small quantity of mixture necessary for idle running. Increased suction in the engine, by increasing the air pressure on the base of the air piston, naturally causes the piston to rise as the speed of the engine increases. The effect of this is to cause a greater flow to occur and incidentally, to admit a proportional quantity of additional fuel to be lifted from the main running jet. As the suction is regulated in some measure by the position of the throttle it follows that the air and gasoline control also is governed indirectly by the throttle position.

Reference to the illustration shows the construction more in detail. The low speed nozzle is shown at A; it is provided with a fine screw threaded adjustment for regulating purposes. At G is the high speed needle, which is carried by the air piston F, while the upward travel of the valve, corresponding to the high speed adjustment of the carburetter, is regulated by the screw B. The primary air inlet beneath the air piston is shown at M, the air inlet proper being at the port marked J. The main air passage is at N.

To prevent "hunting" in the regulator, an apron is constructed on the lower end of the air piston, which operates in conjunction with the so-called "vacuum port" I. The rush of air through this port, following the displacement of the piston, serves to prevent that member from fluttering and to steady the action of the carburetter. The water jacket surrounding the mixing chamber is connected up at K. The float chamber P, priming pin O, throttle lever L, and gasoline passage H, are indicated in their relative positions.

#### Automobile Theft Prevalent in New York.

Stealing automobiles seems to become almost as common as stealing bicycles. Two cases were reported to the New York City police in one day, and so far no trace of the missing cars has been found. One of the cars was a \$2,500 touring model, used for public renting purposes, and was stolen while the chauffeur was called on a fool's errand into a house on West Twenty-first street.

#### Abyssinia to Have 200 Miles Motor Line.

The German Overseas Commercial Co. has obtained a concession to establish an automobile line in Abyssinia, which will connect Addis-Abeba with Dire-Dhaua. The automobiles require only two days to accomplish this journey of almost 200 miles, which takes caravans fully six days under favorable circumstances. Two automobiles for passengers and luggage are dispatched every day.

**MOTOR TRUCK CARRIES MOTOR CARS**

**Special Vehicle Helps Keep the Studebaker Products Spotless in Delivery—Its Ingenious Loading Equipment.**

Transferring automobiles from one store room to another or to a different part of the city, without splashing the car with dirt and dust by running it along the streets under its own power, or trucking it in the old way, is not so easy as it may seem. The Studebaker Automobile Co., of South Bend, Ind., has designed a special truck for this kind of work and is using it continually in transferring automobiles, carriages and

and ever increasing popularity of the motor car in even the remotest islands, a remarkable increase of the production and export of lubricating oils is shown by the reports of the Bureau of Commerce and Labor. While ten years ago, when the motor car industry was in its infancy, the total exports of lubricating oils from the United States did not exceed 60,000,000 gallons per annum, the exports from this country now amount to fully 200,000,000 gallons (1909), of which total the United Kingdom receives about one-fourth; France and Germany together take another quarter; other Europe another fourth, and the rest of the world the remaining fourth. The exact amount of lubricating oil used for automobiles outside of the United States is not known, but

STUDEBAKER TRUCK WITH UNUSUAL CONVENIENCES

wagons from the factory to the show rooms or other outside points.

The body, as shown by the accompanying illustration, is built on an incline, and at the end is a tail gate. When loading an automobile, the tail gate is lowered and an electric hoisting machine, located under the driver's seat, pulls the car aboard; the tail gate then is lifted and locked and the truck is off. When unloading, the peculiar slant of the truck allows the car to run off by gravity. The hoisting machine is equipped with a brake which automatically guides the car off gently.

This truck does away entirely with the use of skids, etc., and saves the time and labor of several men necessary under the old method. By its use it is possible to transfer large automobiles with no possibility of marring the varnish through scratching or rubbing, as is usually the case when the loading is performed by a crew of four or five workmen. An automobile can be loaded on this truck and the truck be on its way in 25 seconds, which is a great saving over the old methods.

**Motor Cars Increase Oil Exports.**

Coincident with the great rise of the automobile industry in all parts of the world,

from comparison with statistics of former years is estimated at a little over 55 per cent. of the total of 200,000,000 gallons, or about 110,000,000 gallons.

**Britons Have a Real "Motor Bank."**

While there is a "traveling bank" in New York City, its modus operandi differs considerably from that of the recently installed "motor bank" in England. The American "bank" merely acts as a collecting agent, in so far as it visits restaurant keepers, merchants, artisans, etc., who have an account with the "home" bank, and takes their deposits. The English perambulating financial institution, however, does a regular banking business all over the rural districts, stopping at crossroads, in villages, at school houses, taking deposits as low as one penny, cashing checks, drafts, and other bank paper, making cash loans on good securities, in short, doing a complete banking business in all its phases.

So far the innovation has proven a huge success, and it is intended to install a full dozen of such traveling banks in the various sections of the British Isles. Needless to say the chauffeur and manager are heavily armed in order to resist possible attempts at hold-up or robbery.

**"TRIAL ASSEMBLY'S" REVELATIONS**

**How It Discloses Defects not Only in the Car, but in the Organization of the Factory as Well.**

Because a motor car runs smoothly under the guidance of even an inexperienced driver, it does not necessarily follow that the human mechanism by which it was produced moved with corresponding precision. Indeed, many of the large and better established manufacturers, having accomplished the necessary step of establishing a trustworthy reputation, are finding it exceedingly difficult to co-ordinate their production machinery in such a way as to secure uniform and harmonious results with a minimum of political friction. It is in recognition of such a difficulty that the "trial assembly" department has been introduced by one of them as a simple way of overcoming a complex difficulty.

It is relatively a simple matter to design a single motor car component and later to conceive a simple and inexpensive process by which it can be made. But when it comes to linking up a great number of such individual processes in such a way that their products may be assembled into a single well-knit automobile not a little difficulty often is experienced. And since the greater the number of parts of a given kind required the greater the effect of any error which they may introduce, so it is upon the heavy producers that the burden of perfecting the organization machinery rests most heavily.

It was a broad step in the right direction when automobile manufacturers so far recognized the peculiar and special requirements of their business as to establish engineering departments and instal at their heads trained and competent engineers. But it also was a step fraught with some peril to the peaceful conduct of their growing organizations to the extent that it tended to create a division of authority and to foster such jealousies and bickerings as are apt to arise whenever one man is placed in a position to criticize or question the work of another.

Manufacturers and those familiar with the inner workings of the producing machine are well aware that not infrequently the engineer is placed in the difficult position of critic extraordinary to the entire production end of the enterprise, and that in consequence of his strictures, unless he be at odds with pretty nearly every one with whom his work intersects. The full significance of the condition has not become sufficiently pronounced to be apparent to all as yet, however; indeed, it was not faced directly as a "problem" until the adoption of the trial assembly plan by one far-seeing production engineer, whose name is associated directly with the output of a vast

number of cars as a result of his past and present connections. By this plan an entirely new method of co-ordinating the creative and constructive elements of manufacture is being tried out, and with results which thus far seem thoroughly to justify its existence.

To appreciate more fully the nature of the remedy, it may be necessary to dwell upon the evil which it is sought to repair. Primarily a creator, it may be considered an ideal thing to isolate the engineer from the labors incident to production in order to leave him mind-free to go on improving his old ideas and developing new ones. And this theoretical advantage might hold, were it possible to conceive of an engineering department utterly free from human weaknesses, or a production end capable of building letter perfect, according to specification. Actually, however, errors not infrequently arise somewhere between the engineer's conception of a device, the draughtsman's delineation of it, the manager's criticism and the factory's handling of it. Somewhere along the line a purchasing agent, a stockroom boy, a toolmaker, a smith or a machine hand introduces a little individuality of his own into the product, so that it reaches the assembling floor in form slightly different from the original concept. Maybe, a large number of parts ordered from an independent producer arrive and do not fit properly—difficulties of the sort are neither rare nor insignificant. Because the basic idea was his, obviously the error which has crept in thus surreptitiously also must be his, it may be considered, and sooner or later the engineer is informed that an undreamed of contingency has arisen which is plainly "up to him."

Or it may be that the little difficulty remains concealed and ultimately breeds others similar in kind. A foreman discovering that a certain line of parts do not fit according to specification, but mindful of the urgency of getting out the work and reluctant to precipitate a conference of the powers that be right in his own little wire cage, hastens to modify some corresponding piece to suit the requirements, and lets it go at that. If he dies or is removed by a Providential hand, his successor may have difficulty in filling his shoes, and sometimes it is not unbelievable that he might be reconciled to such a contingency. For the man who is anxious to increase his worth to the company to such a degree that he is willing to go to almost any length to accomplish the desired end flourishes just as successfully in an automobile factory as he does in a department store or a Congressional lobby.

So it comes about that the work of the engineer frequently undergoes changes of which he has no knowledge—changes of which there may or may not be record in the drawing room, and of which the superintendent may or may not be aware. His responsibilities thus become to a degree nominal, and his mental attitude far from a happy one, especially when his search for

the cause of some failure in the product develops the fault in a quarter over which he has no control. Not even a well-organized inspection department is able to overcome the basic difficulty entirely. Something to uphold the hands of the engineer, to check the ambition of the factory superintendent, even to counterbalance the urgings of the sales manager, who has been "stalling off" deliveries for what he thinks an interminable period, seemed necessary in order to ensure perfect harmony in the work of a number of factories all more or less related in the manufacture of a huge and varied output. Hence the establishment of the trial assembly department.

Essentially, this new department is termed by its originator a sort of settling tank into which may be drained all the complaints which overflow from the various sources of such emanations, and whence may be extracted periodically such useful material as remains after the useless vapors have been given off and temperatures have been equalized. Actually, it is just what its name implies. For instance, a new model is to be brought out. The usual tedious processes of experimental tryout on a model; preparation of designs, drawing of specifications, invention of processes for manufacture, preparation of jigs and special tools, and, finally, ordering of material, are gone through with in the regular way, and finally a trial lot of parts is finished. Then the product is considered ready for trial assembly, and everything else comes to a halt pending the crucial test.

In a special shop, sacrely isolated from all factory contamination and directly under the vigilant eye of the chief engineer, is the trial assembly room, manned by the trial assembling crew, which is a corps of expert mechanics especially trained by the "chief" and equipped with an assortment of wrenches—and little, if anything, else. Into this shop are bundled the parts for one of the new cars, and then the doors are locked. If the assembling crew is able to evolve the complete vehicle without fitting or jamming together of parts, and without resort to machine work of any sort, the vehicle is taken out on test, and if then satisfactory, the final "O. K." is given, which means that production may proceed according to drawing room specifications. If any hitch occurs, the chief is called in to go over the difficulty and suggest such changes as may be necessary. But thereafter work on that particular model cannot proceed until all drawings and specifications, even all equipment involved, have been changed to suit the requirement.

A subordinate, though hardly less important, purpose of the scheme is to make the trial assembling department a clearing house for all production troubles which may arise at any time, and also for such complaints from the field as from time to time may come in through the selling department. Hitherto it has happened not infrequently that a user's or agent's complaint about a clutch bushing, for example, may

have been turned over to the foreman of the particular shop in which that bushing was turned out; his natural course has been to suggest an immediate remedy and then, perhaps, to forget it. In other instances, complaints have been stifled by kind words which had their origin in the sales end itself—that department possibly being influenced to some extent by fear of the engineer in his self-assumed dignity. Compelling all complaining witnesses to testify before the trial assembling department, and subjecting all mechanical puzzles to inquisition in the chamber of horrors behind the trial assembling room door, it is thought, will provide speedier remedy for such evils as escape notice at the outset of production, but frequently are rectified later on at almost endless expense.

In other words, while its function nominally has to do with initial production merely, the trial assembly idea in actual purpose involves the creation of a general sanitation plant for the entire production enterprise. In familiar language, it is intended to "form a more perfect union, establish justice, insure domestic tranquility, provide for the common defense" and "promote the general welfare." And it is unquestionable that its purpose is a broad and salutary one.

#### Michigan's Production Written Large.

Proud of its automobile plants, the State of Michigan, through its department of labor, has prepared official statistics concerning the motor car industry within its borders. According to the official figures for 1909, the total capital invested in the Michigan companies was \$34,587,620; the aggregate value of the year's output of 271,440 cars was \$135,005,465, and the cost of the material used was \$75,198,480, while \$75,471 per day was paid in wages to 27,996 employees. Official cognizance was taken of 38 manufacturers, Detroit leading with 17; Pontiac, 4; Lansing, 3; Jackson, 3; Flint, 2, and Owosso, Grand Rapids, Dowagiac and Saginaw, 1 each.

The 72 superintendents received an aggregate salary of \$178,008.48, or an annual average of \$2,471.04, while the 1,419 office employees received an average daily wage of \$3.61. The average daily pay of the 591 foremen was \$4.07, while 20,572 skilled employees received an average of \$2.82 per day, and 5,404 common laborers received a daily aggregate of \$9,797.

#### Long-Leaved Pine Improves Highways.

Leaves are not generally considered to be useful road material, but in certain districts of the South, they are used with great success. There are many miles of road which would be almost impassable, were it not for the leaves of the long-leaved pine. These, which are in appearance very much like straw, are raked over the sandy roadbed once a year, usually in October, covering the deep sand and making a firm surface.

## EFFECT OF A. A. A. AMATEUR RULE

How It Will Affect the Long Island-Crescent Team Contest—Interferes Also with Chicago Event.

"That inter-club reliability contest between teams from the Crescent Athletic Club and the Long Island Automobile Club ought to prove a fine thing for amateur sport," remarked a man who has been identified with sports for a good many years. "But in view of the position of the Crescents it looks as if they'll have to hew much closer to the amateur line than heretofore has been the case in automobile contests; in other words, the two clubs will have to exercise some fine distinctions in picking their teams.

"The situation that the projected contest creates should draw attention to the remarkable amateurism that is defined by the American Automobile Association's rules. They say that a man may compete with a professional and remain an amateur, but that no man who is in any way engaged in any branch of the automobile industry will be registered as an amateur, the latter specification being a late addition to the rule. On the other hand, the Amateur Athletic Union, from which the Crescent Athletic Club draws its nourishment, says that any man who competes with a professional, even a professional automobilist, thereby forfeits his amateurism. As professionals are denied membership in the Crescent Athletic Club, it readily will be seen that if it adheres to one of its cardinal principles, extreme care will be necessary in selecting the teams for the contest.

"I assume the A. A. A. will live up to its own requirements and insist that the competitors all shall take out amateur registration cards and as no such card will be issued to any man in the trade, no man in the trade—and there are a number of such men in both clubs—can participate, or if he does so, he will professionalize both teams and the Crescents then will have to call for a number of resignations. Personally, I am curious to discover how the two clubs will handle the several points involved, for if the Amateur Athletic Union means what it has said, and if the Crescent club faithfully subscribes to the A. A. U. doctrine, it cannot afford to overlook any breach of the amateur rule and there may be need for action on the part of both, else the underpinning may be knocked from amateurism.

"That A. A. A. rule denying amateur registration to any man who makes or sells a car or a lamp bracket, is likely to affect still another inter-club contest—the one between teams from the Chicago Athletic Club and the Chicago Motor Club, which is held each year. The Motor club is a trade club, pure and simple, and as hereafter its members can obtain only professional registration

cards from the A. A. A., there is no way for them to escape being officially branded "professional," and as amateurism is the cornerstone of and a requisite to membership in the Chicago Athletic Club, no member of the latter now can compete with a member of the Chicago Motor Club without thereby becoming a professional also and thereby forfeiting his membership in the athletic club. It therefore means that the team contest must be abandoned, or if it is continued, that the latter club will lose a lot of desirable members—or else that the A. A. A. lacks the backbone to enforce its own rules.

"In whichever way one views them, those rules create a pretty kettle of fish, and the smell ought to be strong enough to convince the A. A. A. that its position is untenable."

### To Provide "Pickings" for Lawyers.

Having found the picking easy and good in Massachusetts, the Automobile Legal Association has sprouted a branch and set up an office in New York City, where it expects to do even better than in the Bay State. H. Walter Webb figures as president of the New York institution, of which F. H. Elliott, secretary of the A. A. A., is secretary. Several other A. A. A. men have loaned their names to the enterprise in the guise of an "advisory committee." The "real works," however, is W. A. Thibodeau, who is treasurer and general counsel. He came from Boston and knows "just how the thing works." The chief purpose of the association is to provide "pickings" for lawyers. Each "member" of the association pays a stated sum each year, in return for which he can call on an association attorney for help whenever he is "pinched" by an unsympathetic cop.

### Long Islanders Accept Crescents' Challenge.

At a meeting of the contest committee of the Long Island Automobile Club, of Brooklyn, N. Y., this week the challenge of the Crescent Athletic Club, of that city, for an amateur automobile team contest over Long Island roads for a trophy offered by A. R. Pardington was accepted. Representatives of the two organizations now will get together to arrange the details of the match which will give to amateur sport the stimulant it so badly needs, as well as cement closer the ties of friendship between the competing organizations.

### When an Entry Fee Must be Returned.

The suit of the American Automobile Co. against the Motor Racing Association for entry fee in the last 24 hours race at Brighton Beach has been decided in favor of the plaintiff. The litigation arose from the fact that when the race was postponed from October to November the American entry was withdrawn, and although advertised as starting it did not start in the last race. The Motor Racing Association held the entry fee and returned it only upon the decision of the court.

## NEW JERSEY REPELS "FOREIGNERS"

Votes for Continuance of "Hold-ups," but Its Air Remains Free—Trenton Club Takes "Patriotic" Action!

After passing the lower house of the New Jersey legislature, the Edge bill, which sought to give non-resident motorists the right to travel in that state without payment of a registration fee for three periods of five days in each year, was throttled in the Senate, where the lovely Mr. Frelinghuysen abides. The vote, taken on Tuesday last, was 15 to 4 against the bill.

During the last week or two, considerable opposition to the measure was manufactured, chiefly in Mercer county, where the legislature is in session, even the Mercer County Automobile Club adding its voice to the protest. Of course, no one would even dream of accusing the club of being subject to political influence, as it is well known that its members are filled with delight whenever Pennsylvania calls on them to pay \$3 or Vermont \$10 for the reciprocal privilege of using the roads of those states.

The club's resolution of protest against the Edge bill, not only opposed the proposed five days privilege, but also the existing tourists' rate, and implored the legislature to force the hated "foreigners" across the river to pay the same fees as the New Jersey men. The Mercer County men are said to be so anxious to "pay as they go" and to help keep highways in good repair that at the next meeting of the club they will pass resolutions of regret that the pending law in New York will permit them to continue to enter and use the roads of the Empire state free of charge. They much prefer to pay the maximum fees!

### "Chaufeur" is Legally Defined.

The decision of the deputy attorney general of Pennsylvania that the word "chauffeur" in the new state law meant any person driving an automobile, and which was upheld by a magistrate, has been overturned by Judge Staake. The latter has ruled that the word means "the paid operator of a motor vehicle," which long has been the common understanding. Judge Staake rendered his decision in the test case instituted by the Quaker City Motor Club in which Stanley Cooper, of Philadelphia, was arrested and fined for driving his sister's car without a chauffeur's license. He claimed he was not a chauffeur within the meaning of the law, and this contention was upheld.

### Nebraskans Form the Otoe Club.

Motorists of Nebraska City, Neb., have formed an automobile organization to be called the Otoe Motor Club, and elected the following officers: Ralph A. Duff, president; John Harkel, vice-president, and Harry Rolfe, treasurer.

**"NATIVE SON" DEFEATS "INVADERS"**

**Californian Three Times Takes the Measure of Harroun and Matson—But Harroun Evens up the Score.**

It was nip and tuck between Ray Harroun and his Marmon against Al Livingston, piloting a Corbin, for stellar honors at the opening meet of the California racing season at Ascot Park, Los Angeles, on Friday and Saturday, March 5 and 6, and when the two days' speed session was ended the native son had somewhat the best of it. Harroun and Joe Matson, the latter of whom again is wearing the Marmon colors, made their debut on the coast, and although the former captured a majority of the events, it was Livingston who bagged the headliners on the double bill.

On the opening day there were four numbers on the card, with a 25-mile event as the feature. With the high class talent that faced the gun, it was safe to predict that the going would be fast and exciting, and predictions were fulfilled, for it was one of the most exciting quarter centuries ever spun on a coast track, and Livingston was first across the line at the finish. This lowering of the colors of the Eastern cracks by a practically unknown driver, who, although having competed at previous Ascot meets, had achieved but indifferent success, surprised and delighted the natives, who made a hero of the local lad and carried him on their shoulders. Livingston also annexed the five mile handicap, while the remainder of the card—a five and a ten miles event—were taken by Harroun and his speedy Marmon, his team mate being runner-up on each occasion.

With the enthusiasm which the fine racing of the first day produced, it was to be expected that a larger crowd would register at the box office for the second instalment of the speedfest, and this was the case. The defeat of the Eastern stars on the previous day presaged revenge at the second round, but Livingston still retained that quality which largely contributed to his initial triumphs—his willingness to plunge through thick clouds of dust on the turns where his competitors slackened slightly. Only three events were put on, but what was lacking in quantity was more than made up by the quality of the offerings. With a 50-mile derby as the big plum to be picked, Livingston made the best run of his track career, lapping five of the field of six and showing the way at the finish to Harroun by a good margin. However, Harroun derived some satisfaction for his defeat by making a runaway in the five and ten miles events.

**First Day—Friday.**

On the line for the curtain raiser, a five miles open, were Harroun, Livingston, O'Donnell, in a Pennsylvania, and Ende-

cott, at the wheel of a Cole. The battle was between the first named pair, who steadily pulled away from the others, but Livingston couldn't quite overtake Harroun and the latter scored the first victory in a close finish. Endecott trailed home third. Time, 5:18½.

Again in the ten miles Harroun took the lead early and kept in the van and was leading by a good margin at the finish. Livingston again was the runnerup, and Matson scored a third in the first official tryout of his new love. The clocks registered 10:25½ for the journey.

Livingston first showed his form in the five miles handicap. He had the smallest allowance—10 seconds—but nevertheless it wasn't long before he overhauled Siebel with the Sterling, who had 35 seconds grace. Continuing his elimination process, he next went by Endecott and O'Donnell before the end of the third mile and finished far in the lead. The last named pair finished in that order. Livingston bettered Harroun's time for the five circuits, making the trip in 5:07½.

As usual, Harroun was the quickest in getting away at the send-off of the quarter century grind, which had six starters. Livingston, Matson and O'Donnell followed in that order, and the procession remained unchanged for nine miles. The cars frequently were lost in the great clouds of dust which were stirred up. Livingston showed a willingness to plunge through the clouds full tilt, whereas the others eased up a bit, and this recklessness finally brought the local boy on even terms with Harroun. They came down the stretch abreast, in the tenth mile, but Livingston uncorked a few more sparks and went to the front. He was never headed again, but continued to shave the corners close and rung in in 25:56¾. He also had to his credit the fastest mile of the day, which he turned in 1:01. Harroun and Matson checked in second and third.

**The summaries:**

Five miles open—Won by Ray Harroun, Marmon; second, Al Livingston, Corbin; third, William Endecott, Cole. Time, 5:18½.

Five miles handicap—Won by Al Livingston, Corbin (0:10); second, William Endecott, Cole (0:25); third, Morris O'Donnell, Pennsylvania (0:25). Time, 5:07½.

Ten miles open—Won by Ray Harroun, Marmon; second, Al Livingston, Corbin; third, Joseph Matson, Marmon. Time, 10:26½.

Twenty-five miles open—Won by Al Livingston, Corbin; second, Ray Harroun, Marmon; third, Joseph Matson, Marmon. Time, 25:56¾.

**Second Day—Saturday.**

Livingston's track career nearly came to a sudden and abrupt end on the second day, when a steering knuckle snapped in the ten miles race, but fortunately he managed to stop right side up and the car was not

seriously damaged. With his formidable rival eliminated, Harroun won the event hands down, and Matson crowded Endecott out of second. Time, 10:21½. The five miles for stock cars was a walkover for the Indianapolis combination, Harroun running away from the field. Livingston and O'Donnell disputed second and the former got it. The watches recorded 5:11 for the distance.

After holding up the field for several minutes while he replaced the broken knuckle, Livingston came to the line for the fifty miles flight, and the field of seven were dispatched on their half-century journey. Again displaying his superb track generalship, Harroun jumped the field and gained a substantial lead. Livingston, who was looked upon to dispute Harroun's leadership, found the pace too hot and the dust too thick, and eased up a bit, and at the ten miles post Harroun was half a mile to the good. Then the Angeleno lad took a fresh breath and buckled down to his task again, with the rest of the pack well strung out but going strong.

The fight was between the East and the West, and Livingston gained slowly but steadily and was close on his man when, in the 29th lap, Harroun pulled up with a slipping clutch and the Corbin went by like a flash. A few handfuls of sand cured the slipping temporarily, and the Hoosier went out to try and pick up Livingston, who was going great guns. It was too great a task, however, and at 40 miles the local boy led Harroun by three-quarters of a mile and had lapped the rest of the field. In the last stages Harroun made another strong bid for the lead, but it was met by an equal burst from the man in front, and Livingston crossed the line a winner by nearly a minute. Matson scored another third. The time, 50:26¾, is the best for the distance ever hung up on the coast, and is the more meritorious in that it was made by a stock car which has been campaigned in many previous meets.

**The summaries:**

Five miles, stock cars—Won by Ray Harroun, Marmon; second, Al Livingston, Corbin; third, Morris O'Donnell, Pennsylvania. Time, 5:11.

Ten miles, stock cars—Won by Ray Harroun, Marmon; second, Joseph Matson, Marmon; third, William Endecott, Cole. Time, 10:21½.

Fifty miles free-for-all—Won by Al Livingston, Corbin; second, Ray Harroun, Marmon; third, Joseph Matson, Marmon. Time, 50:26¾.

**Racing Association Leases a Club House.**

The Motor Racing Association, of New York, which has existed largely to promote 24 hours races on the Brighton Beach track, has leased the building 304 West Fifty-eighth street and will conduct it as a club house. A feature will be made of a daily luncheon which it is hoped will attract the automobile tradesmen who are so numerous in the immediate locality.

**CUNTZ UNCOVERS ANCIENT HISTORY**

**Credits Missionary in China with Original Automobile Idea, and Americans with First Inflation of Price.**

Fathers have been known to disown their offspring in many instances, but probably it will surprise most people to learn that James Watt, affectionately known as the "father of the steam engine," left a specific provision in his will forbidding the use of automobiles driven by high pressure steam engines within the confines of his estates in England. This provision seems all the more remarkable when it is known that in addition to developing the steam engine to a state of practical utility, "Daddy" Watt himself, in 1783, had taken out a patent on an automobile in which he contemplated the use of high pressure steam.

This little known item of automobile family history was disclosed by Hermann F. Cuntz, of the Association of Licensed Automobile Manufacturers, in the course of a lecture delivered last week before the Stevens Engineering Society at Stevens Institute, Hoboken, N. J. Mr. Cuntz addressed the budding engineers of Hoboken upon the broad and useful topic of the opportunities which the automobile industry offers the trained expert in engineering matters. But incidentally he found occasion to introduce a number of interesting production figures, as well as to shake down the family tree and hand around several little known bits of historical fruit.

Among them was the assertion that, despite the vaunted seniority of the European branch of the industry, its real commercial impulse was acquired as a result of American interest in its progress. As is well known, some of the early racing contests first called the attention of the world at large to automobile development in France.

"That assisted very materially in the development of the industry as to practical tests and indicating what they should make for the public," said Mr. Cuntz. "But those constructors did not make any money out of those races until some wealthy Americans happened to visit the Paris and Bordeaux races in 1895 or 1896. They felt that the car that won the race ought to belong to them, but the French driver told them he had made the car for that race and was then going to throw it away and was not going to sell it. The Americans insisted they must have it. After consulting with his associates the driver decided that, although it cost them about \$3,000 or \$4,000, or the equivalent in francs, he would not sell it. He insisted that it was not worth anything after the race. The Americans, on their part, persisted and finally bought it for 6,000 francs."

Immediately the Gallic head began to sell;

the car which finished second in the race was sold at a further advance, "and that," Mr. Cuntz avowed, "gave them the idea in France that there was real money in the building of machines. By the way, I happen to know that that little incident was a very powerful factor in developing the industry in France. It was a great surprise to them that Americans would pay that money for machines they were going to throw away, because it was giving them money to build more machines—which, of course, was good. But it sticened their idea of the value machines had for rich Americans. That was the start of high priced automobiles in France, and that is the way that Americans, as a practical business proposition, supplied the means for the development of the automobile industry in France."

All the textbooks which the chauffeurs' academies sell to their pupils at a price tell how the automobile first came to be invented. But the A. L. A. M. expert, who has made a very close study of the subject in examining into the status of the Selden patent, has a version to offer which is slightly different from those printed in most of the books.

"A Jesuit missionary, about 1645 or 1650," according to Mr. Cuntz, "was attached to the Court at Peking, China, and he built a little toy, . . . attached to this a small boiler that discharged toward the rear of the vehicle and so propelled it forward. He placed a larger wheel on the outside than on the inside, so that the automobile would go 'round in a circle to amuse the people of the Court. From that on for over 150 years all sorts of attempts have been made to develop the self-propelled vehicle. . . .

"The successful attempts made in France, which are always stated as the first attempts made, to operate self-propelled vehicles, were made by a captain of artillery, but he had the misfortune, after a grant of money had been made to him to build an automobile—in 1787 or 1788, which automobile was intended to draw cannon—to collide with a building in the streets of Paris, and they promptly arrested the automobile and stopped his allowance, and the automobile was locked up in the Museum of Arts de Mecaniques in Paris until an American resurrected it as a valuable and interesting thing to the whole engineering fraternity.

"About 1777 the Germans became rather active. One man, a captain of artillery, thought that he could use the discharge of a gun, and promptly designed a vehicle with a cannon on it at the rear, which was intended to compress a spring and that, in turn, to drive the machine. . . .

"Consider for a moment that the locomotive designs were started in about 1800 or 1804, and in one century the steam locomotive has been developed to the state that you now observe it. The automobile, however, has developed in ten years more than the locomotive has developed in a hundred

years. In 1783 James Watt took out a patent on an automobile in England. . . . Self-propelled vehicles were used from that time on until about 1830 or 1831, but with very little success.

"It is quite interesting to note that a select committee of the House of Commons in England was appointed to investigate the subject, and all the known engineers were examined regarding the practicability of traveling vehicles on roads. Here is a reprint of the report of the select committee of the House of Parliament which the American Congress ordered made. So you will see that the history of the automobile in the United States began at quite an early date. This was reprinted in 1832.

"Prior to that Oliver Evans, well known in mechanical engineering circles, or, rather, well known in engineering circles before there was a distinction between mechanical or civil or any other class of engineers, advised a combination of a steam engine and a wheeled vehicle. He went to the Legislature of Pennsylvania and endeavored to persuade them to give him the exclusive grant, in consideration of the expense he would be put to to introduce it, to construct and operate self-propelled vehicles on roads. They felt that he was a fool and that it was a 'crazy' idea and refused to give him the grant. So he went to Maryland; and Maryland has the distinction of having granted the first patent to anyone in the world for the utilization of self-propelled vehicles. . . .

"Shortly after that Evans built an automobile and called it the Amphibia. There was a propeller in the rear and two side wheels, and it could be propelled on land or in the water. He ran that down Chester street, Philadelphia, and into the Delaware River and up the Delaware River to Trenton. That was about 1786. Then a man named Reed, in Massachusetts, actually ran a steam propelled vehicle about 1805. So America stands before the world in the use of steam propelled vehicles."

**When an Automobile is Outlawed.**

Unregistered cars which are driven on the highways of Massachusetts are outlaws, and the occupants thereof who may receive injuries caused by defective highways are not entitled to recover damages according to a decision rendered by the Massachusetts Supreme Court. The decision, which was handed down in a suit for damages brought against the city of Melrose by the occupants of an unregistered car, who sustained injuries by running into an unprotected excavation in the roadway, is of general interest as defining the status of unregistered cars in the Bay State. In the lower court the plaintiff recovered verdicts in their favor, but the city took an appeal to the higher court, which reversed the ruling. The decision should prove wholesome deterrent to any irresponsible persons who may feel inclined to roam in unregistered cars within the borders of Massachusetts.

## LAMPS WITH GILDED REFLECTORS

**Their Appearance on Foreign Market  
Causes Discussion of Their Merits—  
The Claims Made for Them.**

In consequence of the introduction to the British market of a brand of automobile headlights which are equipped with gilded reflectors, some little discussion has been aroused as to the relative advantages of gold and silver surfaces for the purpose. The chief advantage originally claimed for the light beam reflected from the gold mirror is that its powers of penetration through foggy atmosphere are far superior to those of any other form of light; to these claims have now been added the no less important claim that objects seen in the light of one of the new style lamps assume more nearly their natural colors and are more readily distinguished than by the light of the more ordinary form of lamp. These claims, coupled with the promise that within a short time the lamps equipped with gold reflectors will be placed on a practically equivalent price basis with other products of corresponding size, have considerably added to the interest which the novelty of the system alone would induce.

During the long and effective series of lamp trials conducted by the Royal Automobile Club last August, it will be remembered that three lamps with gold reflectors were subjected to the standard form of trial and with results which compared favorably with those derived from other systems, though without materially distinguishing the newer devices. The "Golden-lyte" line which has since been introduced, is an outcome of the experimental systems then used. In general service the new lamps do not differ materially from other lamps. For acetylene service the simple lens mirror principle is employed, the backs of the lenses being gilded by a new and more or less secret process of precipitation analogous to the method by which ordinary mirrors are silvered.

The electric headlights employing the gold reflectors are distinguished by more novel characteristics in that the main body of the lamp is hermetically sealed and either filled with a non-oxydizing and dry gas or partially exhausted of air. To this end, the front is sealed in place, while the light bulb is enclosed in a small glass dome which is inserted from the back, through which also the lamp itself is inserted. The mirror thus is protected from oxidation.

With regard to the relative qualities of silvered and gilded reflectors, the *Automotor Journal* observes that "rays reflected from a polished gold surface are unquestionably colored, and for this reason it is only logical to suppose that they have less absolute intensity of illuminating power, as compared on a photometer, with a white light beam reflected from the same source.

"To diminish the intensity of the beam would presumably be also to diminish its efficiency from the motorist's point of view," continues this authority. "But this is exactly what the aforementioned research has shown does not take place. Experiments . . . have confirmed in a very striking manner that there are qualities in a light reflected from a gold surface that more than compensate for the loss in the intensity of their photometric value. We presume that there is an appreciable difference between the photometric intensity of the silver and the gold light, although we have not been placed in possession of any relative values, nor, curiously enough, were we able to detect any appreciable difference in the density of the shadows cast upon ordinary outdoor objects by the two lights at the same range.

"We understand, however, that the spectrum of the light reflected from the gold mirror stops short at the color green, being deficient in violet, indigo and blue light, and therefore relatively strong in the green, yellow, orange and red rays. The absence of the blue light appears to have a beneficial effect on the illuminative value of the remaining rays, at any rate, so far as they relate to the illumination—to suit the human eye—of natural objects encountered by the motorist. It would seem that the general coloring of such objects is extremely responsive to these tones, for the difference in their appearance under light reflected from a silver mirror and light reflected from a gold mirror is most marked; in some respects it may be likened to the difference that exists between the appearance of objects in the sunlight and moonlight. The intense white light of a silver beam produces, by comparison with the gold light, rather a flat effect. The gold beam is what may be described as a 'warm' light, and it seems to make objects more natural in their appearance as they loom up ahead.

"The other important aspect of this comparison is the relative dazzling effect of the two kinds of light, but on this subject it is very difficult to say much of a definite character owing to the lack of a precise definition of what the term dazzling means. If it means absolute blinding effect, due to the intensity of the reflected light striking directly upon the eyes, then both lights are certainly dazzling, although it may be said in favor of the golden beam that it is very much less unpleasantly so, just as, from the driver's standpoint, it is unquestionably superior in its powers of penetrating mist or fog. Away from the direct rays of the long-distance beam, but still in front of the lamp, there is little doubt that the majority of people would pronounce in favor of the light reflected from the gold, again on the score that it is distinctly less intense in appearance. But, as we have remarked, it is extremely difficult to say what does constitute a dazzling light.

"For our own part, and speaking mainly from our experience of night driving, we incline to the opinion that the intensity of

the light itself is less a matter of importance than the relative darkness immediately behind the lamp. If some means were found by which a reasonable amount of side and rear illumination could be thrown on the road without dazzling the driver of the car on which such illumination is provided, we believe that little cause for complaint against powerful head-lights would remain. Such a system would, we believe, break down the intensely black wall which always seems to accompany an approaching car, and makes it so difficult to either see the road or anything that may lie beyond it."

### Rigorous Provisions in New Italian Law.

The new state automobile law for Italy serves as a fair example of how the motor car is treated in continental Europe. As most of the accidents result from incapacity on the drivers' part, the Italian law requires that drivers shall thoroughly understand the construction and operation of the machine. When applying for the necessary permit he must submit to the prefect a certificate of birth, showing that he is over 21 years of age. If he has not reached his twenty-first year, but has passed his eighteenth, he must obtain the consent of the legal representative; also a penal certificate of recent date, a medical certificate of recent date with special reference to his faculties of sight and hearing, and a certificate of graduation from a drivers' school recognized by the Minister of Public Works. In case this latter certificate cannot be furnished, the applicant must pass a rigid examination before an accredited official of the Railway Inspection Bureau.

The Italian law sets up three speed limits; in the open country 25 miles an hour is allowed in daylight; 12½ miles an hour at night; 9½ miles an hour in the city limits. Lamps must be alight from dusk to dawn, and also during foggy weather. Dazzling headlights are forbidden in towns. Horns must have but one note, which must be low in pitch for motor cars and high pitched for motorcycles; exhaust cut-outs are forbidden in towns, and sirens may be used only in the open country.

### Kansas City Motorists Elect Officers.

Officers for the coming year have been elected by the Kansas City (Mo.) Automobile Club as follows: Frank P. Ewins, president; George H. Davis, first vice-president; Frank E. Lott, second vice-president; directors, A. W. Peet, W. W. Cowan, A. J. Davies, Harry T. Fowler and W. T. Whitcomb.

### New Galveston Club is Organized.

Organization of the Galveston (Tex.) Automobile Club has been perfected and the following executives elected for the coming term: J. W. Munn, president; George Sealy, vice-president; Bartlett Moore, secretary; directors, the officers, W. L. Moody, Jr., John Sealy, M. O. Kopperl and Sealy Hutchings.

### INDICATES INSIDE WORKINGS

**Ingenious Instrument Which Serves Unusual Purposes — Ancient Principle Employed in Modern Practice.**

One of the great advantages of the electric vehicle from the operating standpoint is that it furnishes ready means for ascertaining the exact output of energy at any instant of service, and without regard to extraneous circumstances. This the internal combustion engine does not permit without the introduction of apparatus of a very special character. Of the several devices of this nature which have been introduced it is safe to say none is more scientific or based upon more interesting theory than the Dynatak, made by the Electric Speedometer & Dynamometer Mfg. Co., of Washington, D. C., which has recently been exhibited in New York City, though it was not on view at either of the automobile shows.

The principle of this system, which is the

the principle has been adapted to indicating the conditions which exist within the internal combustion motor when in action.

The respective thermo-electric couples are represented diagrammatically at A-B, the candle flames C playing about the junction points, while conducting wires lead to the indicator, which may be a sensitive galvanometer, but which for practical purposes takes the form of an extremely delicate ammeter. The couples 1, 2, 3, 4 are connected

to the type of engine to be indicated. As the indicators are proportional to temperatures at the junction of the respective elements in each pair, it is obvious that they furnish a direct index of thermal changes which occur within the cylinders of the engine, provided the couples are adapted to a form suitable for insertion into the cylinder of the standard form of engine.

This has been done, and the resulting construction is revealed in the two illustrations

VIEW OF COMPLETE DYNATAK OUTFIT

APPLICATION OF THERMO-PILE TO DYNATAK SYSTEM.

invention of Professor N. Monroe Hopkins, is the ancient one of the thermo-pile, which was enunciated as long ago as 1826 by Becquerel. Its only other present application of moment, however, is in the determination of extremely high temperatures by means of a certain form of pyrometer. In a word, the basis of the Dynatak system is that the heating of the dissimilar elements at the point of their juncture generates an electric current of low intensity, but proportional to the temperature. The accompanying illustration shows in a general way how

independently to the indicator in such a way that the currents generated by the respective elements may be indicated on the dial of the instrument independently by placing the small pointer in the base at either of the positions indicated by the numerals "1," "2," "3" and "4." By switching the indicator over to the position "A," as shown in the illustration, the several circuits are connected in series, and the indication shown measures the total current generated in the entire series of couples. Obviously these may be adapted in number

which show two sectional views of the combined indicating and sparking plug. This device, which is essentially the keynote of the system, has been worked out with especial care, and not without encountering serious obstacles. As the necessary thermo-electric elements in themselves would not resist the intense heat which is attained in the ordinary gas engine, provision has been made for cooling them to an equable temperature. The cooling action is accomplished by enclosing the elements in a metallic jacket which is carried up through the porcelain insulating material, of which the body of the plug is composed, and which serves to conduct away the excess heat from the points and prevent them from suffering as a result of carbonization or oxidation.

From the upper ends of the jackets terminals are led to each of the external connection points, from which wires are carried to the indicator, thus forming a complete metallic circuit for the operation of the indicating system. A third point which projects from the lower end of the porcelain is the insulated terminal conductor for the sparking element, which is of regular construction and operation in a general way, save that the connection to the outer binding post is made through the medium of a spring connector within the shell, which prevents excessive strains applied to the high tension sparking cable from breaking or straining the insulation and thus destroying the plug.

The usefulness of the commercial instrument is further augmented by the introduction of an electric speedometer and odometer device, which is driven from one of the fore wheels of the car in the usual manner. This instrument is nothing more nor less than a delicately contrived magneto-generator, designed in such a way as to reduce and standardize all losses as far as possible. An odometer mechanism is built into the upper part of the generator casing while the speed indications are read directly on the scale of the single indicating instrument. As the number of revolutions per minute of the steering wheels is proportional to the speed of the vehicle, it follows that the indications of the meter may be read either in terms of revolutions or miles per hour. As a matter of fact, either indication may be obtained merely by turning a little switch key in the base of the indicator which serves to cut in or out a small amount of resistance in the magneto-dynamo circuit.

The complete outfit as constructed for use with four-cylinder engines, as illustrated, includes in addition to the combined indicating and sparking plugs, the magneto-dynamo, the indicating instrument, and a complete set of conducting cable which is so contrived that the system may be installed without difficulty. The indicator carries a double scale, over which swings a single pointer. The controlling switch in the base enables the current from the speedometer to be directed into the windings in such a way that the position of the pointer over the upper scale will indicate either revolutions of the wheels or miles per hour, as may be required. It also may be turned in such a way as to reveal the temperature variations in either one of the cylinders, or in all of them, if the pointer be turned to the spot on its dial marked "A."

The gradations on the power scale, in the language of the inventor, are said to represent "efficiency." Actually, they do not indicate the real thermal efficiency of the motor, nor any quantity directly related to it, save as a rough proportional. The gradations are based on the theoretical maximum temperature of the engine, as determined in accordance with its bore. If the maximum heat which an engine of given dimensions is supposed to be capable of attaining really is produced in action, the indicating hand of the instrument will point to 100 on the lower scale. If the maximum temperature is 90 per cent. of the theoretical maximum, then the indication will be 90 on the scale.

A moment's consideration will suffice to show the wide range of application of these seemingly irrelevant figures. As the response of the thermo-couples is not instantaneous, the successive fluctuations of current caused by the succeeding explosions in the different cylinders are not indicated by variations in the position of the needle. But so soon as one cylinder misses, a very slight "dip" of the needle will be apparent—

even if no more than single explosion be missed, it is claimed. Turning the controller from one cylinder notch to another then will reveal the "limping" member of the cylinder group. By a similar process, one or more cylinders in which the action is weak or irregular can be detected at once.

DYNATAK PLUG SHOWING COUPLE

Furthermore, as the indicator scale is graduated to record a maximum when the engine is at its best performance, it follows that equal readings should be obtainable for the different individual cylinders, and that a weak cylinder at once may be located simply by turning the controller knob on the indicator. But more than this, the maximum temperature is obtainable only with the correct timing of the valves, with proper compression, proper ignition conditions, and a correct mixture. Therefore, having once

SPARKING ELEMENT SHOWN IN DETAIL

standardized the indications for any engine, it is possible at once to bring it back to its maximum performance, by using the indicator as a means of checking up the results of adjustments. In all probability it is in the sense that the term "efficiency," as

applied to the scale readings, is introduced.

By the same sort of reasoning, it is possible to see that the Dynatak readings may be made to furnish a rough and ready indication of horsepower output. For once the maximum power of the engine is known, the readings of the instrument at once show temperatures, which, in turn, may be construed as proportional to the heat interchange going on within the cylinder, and so with the actual power produced. In this way it is possible to obtain a fairly close index of the relative power requirements of various grades, road surfaces, and also of different styles of body or mechanism, which it may be desirable to compare under road conditions.

#### Bay State Upholds Pictured Evidence.

In the opinion of the full bench of the Massachusetts Supreme Court a chronometer which is dependent on the simultaneous action of two photographic cameras with stop watch mechanism is a trustworthy method of timing the speed of motor cars, and by the terms of this ruling William S. Buxton will have to pay the fine imposed by the Boston police court for exceeding the speed limit of twelve miles an hour on Commonwealth avenue. In taking his case to the full bench of the Supreme Court Buxton filed an exception to the action of the Supreme Court in admitting the timing apparatus as evidence, claiming that there was nothing to show the trustworthiness of the instrument as a time recorder. However, the full bench overruled the defendant's exceptions, and said that the court did not err in admitting the chronometer as evidence, or the evidence as to its construction, or the trustworthiness of the apparatus employed to obtain it.

#### Failure to Relay Street Proves Expensive.

While contractors in America are supposed to restore streets they tear up to the same condition they found them in, the laws to this effect are rarely enforced. In England, however, a contractor had to pay heavy damages to a firm whose motor truck was injured by the bad condition in which the contractor had left the street after laying a few gas mains. The judge said, that anyone disturbing the surface of a public road, and failing to restore it to its former safe condition, was responsible for any damages that might result from his negligence.

#### Sage Brush Useful for Road Repair.

At last a use has been found for the notorious sage brush of the Western arid districts. Motor enthusiasts in the West have completed a series of tests involving the use of sage brush in road building, and found it a great success. Sage brush, placed loosely upon the road, is readily crushed into pulp forming a perfect mat. Sand and earth mixing with this mat make it firm, dustless, noiseless, and of excellent wearing qualities.

THE new Rambler, because of its quiet ease of motion, reserve power, and dignity of comfort, affords to the busy man pleasing relaxation and healthful recreation with family or friends at the end of the day. For satisfactory operation in crowded city traffic, on boulevard, or country road the new Rambler, because of the offset crank-shaft, is capable of three or sixty miles an hour, on high speed, climbing any hill with gratifying ease. The Spare Wheel obviates tire trouble. With straight-line drive, big wheels and tires, and new expanding clutch the new Rambler is superior to all in efficiency and better than any in quality, silence, and comfort.

Rambler automobiles, \$1,800 to \$2,500

## HORSES' BOARD BILLS INCREASE

Which Makes It Easier for the Electric to Show a Big Saving—Figures Which Show the Saving.

Some one asked the other day how the high prices of food and other things that enter into living expenses were affecting the automobile business, and the inquiry induced the statistician of the Waverley factory to delve into figures. After observing that it costs more to live this year than it did last year, and a good deal more than it cost five or ten years ago, he found also that it costs more to keep a horse than it did last year, and a good deal more than it did five or ten years ago. In evidence, he submitted these feed bills of a horse kept in regular service for the last two years by a well-known physician of Boston:

1908.	1909.
January—	January—
12 bu. oats.. \$7.92	6 bu. oats.. 3.72
355 lbs. hay.. 4.44	
50 lbs. corn.. .83	
February—	February—
534 lbs. hay.. 6.67	6 bu. oats.. 3.60
6 bu. oats.. 3.90	50 lbs. corn.. .85
25 bu. corn.. .45	410 lbs. hay.. 4.10
March—	March—
590 lbs. hay.. 7.38	6 bu. oats.. 3.60
6 bu. oats.. 3.90	50 lbs. corn.. .85
25 lbs. corn.. .40	
April—	April—
1 bale straw 2.06	12 bu. oats.. 7.74
6 bu. oats.. 4.02	1135 lbs. hay.. 11.35
50 lbs. corn.. .83	1 bag corn.. 1.65
May—	May—
6 bu. oats.. 4.02	6 bu. oats.. 3.90
352 lbs. hay.. 3.87	
June—	June—
757 lbs. hay.. 8.33	1 bale straw 3.54
12 bu. oats.. 8.04	6 bu. oats.. 4.02
50 lbs. corn.. .85	100 lbs. bran.. 1.75
	1135 lbs. hay.. 12.49
July—	July—
6 bu. oats.. 4.00	6 bu. oats.. 4.20
	1 bag corn.. 1.80
August—	August—
770 lbs. hay.. 7.70	6 bu. oats.. 3.90
3 bu. oats.. 2.16	
September—	September—
3 bu. oats.. 2.01	1542 lbs. hay.. 17.23
50 lbs. corn.. .93	6 bu. oats.. 3.72
October—	October—
6 bu. oats.. 3.90	3 bu. oats.. 1.59
572 lbs. hay.. 5.72	12 bu. oats.. 6.36
November—	November—
6 bu. oats.. 3.78	9 bu. oats.. 4.77
1 bag corn.. 1.85	1040 lbs. hay.. 11.44
50 lbs. bran.. .85	
1 bale straw 2.05	
December—	December—
12 bu. oats.. 7.20	1 bale straw 1.77
1086 lbs. hay.. 10.86	6 bu. oats.. 3.42
50 lbs. corn.. .90	5 bales hay 5.98
\$117.82	\$129.34
Blacksmith's bills .....	Blacksmith's bills .....
29.30	32.60
Driver's wages 300.00	Driver's wages 360.00
" board 182.00	" board 208.00
Total expenses \$629.12	Total expenses \$729.94

"An increase of 10 per cent. in the feed bills of a single horse for a single year may not seem startling to the average mind,"

says the Waverley man, "but when you add to that a similar increase in the blacksmith bills and a still greater increase in the wages and board of a man, and keep up that pace for a series of years the difference is quite significant.

"It will be seen that the cost of keeping a single horse in the city of Boston in 1909 was \$100 greater than in 1908. Now compare this cost with that of using an interior-driven electric in the same part of the country, dispensing with the services of a man. These figures are taken from the experience of a large number of owners of Waverley

## "WHY PAY RENT?"—OR A MOVER?

Ingenious Coburg Painter Shows How to Take One's House Out Motoring—A Collapsible "Car-avan."

It will be rather difficult to extend the adaptabilities of the motor car further than has been done by a German painter, of Coburg. The car shown in the accompanying illustration contains in its body a bedroom, kitchen and toilet, while the extensions enclose a parlor and a living room. The walls

TOURING CAR CONVERTED INTO "RESIDENCE."

electrics of various dates and types, and represent average costs for extended periods:

Cost of current per month.....	\$4.11
Cost of battery renewal per month..	4.85
Cost of tire renewal per month .....	4.40
Sundry repairs per month .....	2.02

Total average cost of an electric per month .....	\$15.38
For one year .....	184.26

A saving in favor of the electric of \$545.68 in a single year.

This saving is due to the very reasonable economy involved in dispensing with the services of a man—an economy that becomes entirely practicable and convenient with the use of an electric. If, however, the owner prefers to keep his car at a public garage and avoid the slight trouble involved in washing and looking after his own car, the additional expense would be less than \$20 per month, and he would still save upwards of \$300 per year on the cost of keeping a horse and a man."

### High Mileage of Massachusetts Motorist.

Charles F. Smith, of Fall River, Mass., who for 20 months has kept a daily record of a six cylinder Franklin which he operates, is another motorist who ranks with the high mileage men. During that period his car traveled 49,635 miles, an average of 82 miles per day. In the nine months between April 1, 1909, and January 1, 1910, Smith covered 25,492 miles, a daily average of 94 miles; he carried 1,731 passengers and used 2,303 gallons of gasoline, 617 quarts of oil and 6 tires.

are formed of canvas stretched between aluminum supports; the furniture is of the collapsible kind and can be carried in a comparatively small space, in niches and on shelves ingeniously arranged in the interior of the car. Electric light furnishes the illumination of the rooms. The owner of this strange "caravan" expects to spend all summer in it, and to travel wherever his fancy takes him, stop where he pleases and as long as he pleases, absolutely independent of hotels, railroads, or even village huts, camping out the whole time.

### Boston's "Move On!" Rule Sustained.

In upholding the traffic rules established by the street commissioners of Boston, the full bench of the Massachusetts Court, sitting last week, denied the appeal of Charles A. Newhall, who was convicted in the lower court of violating the traffic regulations by allowing his automobile to stand for more than 20 minutes in Court Square, Boston. In his appeal, the defendant contended that the passage of the 1909 statute pertaining to automobiles rendered invalid the local ordinance regulating traffic, but the court held that the state law does not affect the ruling of the commissioners.

### Keystone State's Record Registration.

During the first six weeks of the year 1910, the Pennsylvania State Highway Department issued 7,100 chauffeurs' licenses, and registered 11,400 motor vehicles. Both figures constitute new records for the Keystone state.

# KOEHLER "40" \$1650

F. O. B. FACTORY

MONTCLAIR TORPEDO  
DE LUXE BODY

## We Have Had Our Hand on the Trade Pulse for 12 Years

From a modest beginning we have worked up to be the largest distributors of automobiles in the United States. Therefore we know the demands of the dealer, and it is our constant aim to supply them. That we have been successful to date, our record proves. **WE HAVE NEVER MARKETING A FAILURE.**

But conditions are constantly changing, and we must change to meet them, even anticipate them in order to retain our hard-earned leadership. Present conditions demand something different than has been offered. We foresaw this demand and scoured the country over to meet it, but—

## We Couldn't Find What We Wanted and What Our Dealers Wanted So We Were Forced to Make It Ourselves

**The Koehler 40** is a 5 passenger car of 114" wheel-base, has selective type transmission, and is equipped with Splitdorf magneto, 5 lamps, tool box, tools, etc.

**A De Luxe Body of the closed front type, known as the Montclair Torpedo,** absolutely protects passengers from exposure to dust, dirt and cold draughts. This body is without the extreme lines of the full torpedo shape, but retains all its compactness, utility, comfort and refinement.

Our past experience with the trade and individual user, has been our guide in creating the Koehler 40,—we have known what to embody and what to eliminate. The result is a thoroughly high-grade, well-balanced, powerful motor car, and at a price that fills most buyers' minds.

We invite a limited number of live dealers to share with us in the profit of handling this popular car. It will sell at sight because of its attractiveness, will increase your trade because of its satisfactory performance, and will "make good" in any company. Write for specifications, terms, etc.—NOW.

**H. J. KOEHLER CO.,** Sales Office **1709 Broadway, New York City**

## RECENT PATENTS.

944,956. Draft Appliances for Self Propelled Vehicles. Dix Dunlap, La Junta, Col. Filed Feb. 9, 1909. Serial No. 476,937.

1. A draft appliance for the wheels of self-propelled vehicles comprising, in combination, a tubular drum adapted to be fitted upon the wheel hub; a series of clamping members secured to said drum adapted for engagement with the wheel rim; a flexible element fastened at one end to the drum and adapted to be wound therearound; and an anchor secured to the other end of said flexible element.

945,037. Tire. David Hays, New York, N. Y., assignor to Edwin Ball Stimpson, New York, N. Y. Filed July 18, 1908. Serial No. 444,289.

1. A device adapted, to be used in connection with a clencher shoe spreader and a felly, comprising in combination a sleeve having arms projecting from one end insertable through an opening in the felly, said arms being adapted to grip the spreader when brought together, a band inclosing said arms and slidable thereon, a rod working in the sleeve and having operative connection with the band, and means adjustable on the sleeve for delivering thrust against the felly to draw the spreader, gripped by the arms, toward the felly.

945,058. Supplemental Wheel. Milton D. Stocking, Lindenwood, Ill. Filed April 2, 1909. Serial No. 487,581.

1. A supplemental wheel comprising a central hub and rim, a plurality of shoes bodily adjustable toward and from the center of the hub, a screw connected to each shoe by which the shoe is supported, and means for holding them in their adjusted position.

945,059. Speed Changing Mechanism. Robert Symmonds, Kenosha, Wis., assignor to Thomas B. Jeffery & Company, a Corporation of Wisconsin. Filed June 19, 1906. Serial No. 322,368.

1. In a speed changing mechanism, the combination with a driving element, of a driven shaft, a pinion fixed to the driving element, a pinion carrier mounted upon the driven shaft to rotate therewith, a pair of united pinions mounted upon said carrier one of which meshes with said first pinion, an adle pinion mounted upon the carrier and meshing with the other of said united pinions, an internal gear wheel rotatively supported by the carrier and meshing with said idle pinion, and means for locking said internal gear against rotation.

945,115. Vehicle Tire. Edmond P. White, Chicago, Ill., assignor to White Tire Company, a Corporation of New York. Filed Oct. 12, 1906. Serial No. 338,542.

1. A tread for pneumatic tires comprising resilient blocks each of a width to extend substantially from side to side of the tire and having a substantially flat outer surface and an inner surface curved to conform to the periphery of the tire casing, a resilient projection on the outer side of said blocks, and means for securing said blocks to the tire, said means comprising a series of overlapping elements having stiffened portions.

945,120. Automobile Sleigh. George W. Devioy, North Spencer, Mass. Filed Jan. 26, 1909. Serial No. 474,327.

1. A sleigh truck for automobiles comprising a pair of spaced runners each hav-

ing its ends turned upward with curves of equal radius, cross bars holding said runners in spaced relation, and clips arranged to be fixedly secured to an automobile axle and provided with elongated openings adapted to receive one of said cross bars and attach the same to the axle, the clips being arranged to permit vertical oscillation of said cross bar.

945,122. Swivel Lamp for Vehicles. James E. Geary, Quincy, Mass. Filed April 7, 1909. Serial No. 488,516.

1. In combination, a vehicle having wheels mounted on journals pivoted to turn with relation to the vehicle body, a steering rod movable transversely of the vehicle body connected with said pivoted wheel journals, a swivel lamp carried by a post, said being pivotally mounted on the vehicle in a substantially vertical axis, a gear segment fast to said post, a second gear segment in mesh with the first gear segment, an extensible telescoping lever secured to said steering rod and movable therewith, said extensible lever and said arm being connected by a universal joint.

945,167. Carburetter. George M. Holley, Detroit, Mich., assignor to Holley Brothers Co., Detroit, Mich., a Corporation of Michigan. Filed May 9, 1906. Serial No. 315,875.

1. In a carburetter, the combination of a body having an air induct and a mixture educt port, a partition crossing the interior of the body separating said ports, said partition having a valve opening therethrough, a valve seated in said opening and having through the top thereof a plurality of relatively small apertures, a depending tube attached to the valve to embrace said apertures, a fuel supply nozzle projecting into the lower end of said tube, and a valve for regulating the supply of fuel.

945,190. Shock Absorber. John H. Otten, Buffalo, N. Y. Filed April 26, 1909. Serial No. 492,296.

1. A shock absorber adapted to be applied to two parts which are movable relatively to one another, comprising an abutment adapted to be connected with one of said parts, a rocking member adapted to roll on said abutment and to be connected with the other part, and a tension device for yieldingly holding said rocking member in its normal position.

945,245. Gas Engine. George L. Odenbrett, Milwaukee, Wis. Filed March 25, 1909. Serial No. 485,636.

1. A starter for multiple cylinder gas engines, comprising a selecting valve driven by the engine and adapted to establish communication with the respective cylinders of the engine when their pistons are in position to receive an explosion, a charging chamber communicating with the selecting valve, an air reservoir and a gas reservoir communicating with the charging chamber, a controlling valve in the connection between the gas reservoir and the charging chamber, and a double valve having an operating member which when partially operated serves to open one valve member to open the communication between the charging chamber and the selecting valve and which operating member when further operated serves to open another valve member to open the communication between the air reservoir and the charging chamber.

945,250. Friction Clutch. Alfred Soderling, Chicago, Ill. Filed Aug. 11, 1908. Serial No. 447,960½.

1. In a clutch, the combination of two oppositely movable co-operating jaws having friction surfaces and mechanism for positively moving the jaws toward or from each other, said mechanism including a ring carried by one jaw and having an internal groove providing oppositely presented shoulders, a second ring carried by the other jaw and extending into said groove thus providing shoulders adapted to engage the shoulders first aforesaid, a system of toggles jointed to one of said jaws and to the ring carried by it, and means for operating said toggles.

945,278. Combined Spark Plug and Coil. Edwin S. Lincoln, Brookline, Mass., assignor to Electric Goods Manufacturing Company, a Corporation of Maine. Filed May 5, 1908. Serial No. 431,025.

1. The combination with a spark plug having spark points, and an induction coil adapted to energize said spark points, of inter-engaging means in part secured to the coil, and in part secured to the plug, said inter-engaging means in their engaged relation being adapted to mechanically support said coil laterally with respect to the plug and embodying electrical connections whereby said coil is placed in operative relation with respect to said spark points.

945,330. Vehicle. John Kelly, Jamaica Plain, Mass. Filed Jan. 27, 1909. Serial No. 474,422.

1. A vehicle of the class described having in combination, a receptacle, a hopper located at the rear of said receptacle, said receptacle having a rear wall provided with two openings, closures for said openings, and adapted to convey material upwardly from said hopper and deposit the same in said receptacle.

945,336. Spring. Charles A. Lieb, New York, N. Y. Filed Dec. 10, 1906. Serial No. 347,225. Renewed Aug. 3, 1908. Serial No. 446,778.

1. The combination with a support and a spring consisting of superposed leaves or bars endwise movable upon flexure of the spring; of mechanical means for increasing the normal friction between the contacting surfaces of the leaves upon flexure of the spring in either direction.

945,365. Automobile. Charles Berg, Philadelphia, Pa. Filed March 14, 1908. Serial No. 421,031.

1. The combination with a vehicle wheel; of an annular armature and an annular commutator carried by said wheel in rigid relation therewith; a stationary axle upon which said wheel is mounted to rotate; a field comprising a series of polar projections extending within said armature; and means distinct from said axle and including a sleeve carried by the wheel maintaining said armature, commutator and field in co-operative relation; whereby said wheel may be removed from said axle without disturbing the relation of said co-operative elements.

945,393. Internal Combustion Engine. William H. Hollopeter, Portland, Ore. Original application filed July 16, 1907, Serial No. 383,994. Divided and this application filed April 26, 1909. Serial No. 492,227.

1. In an internal combustion engine provided with inlet and exhaust valves, a means for operating said valves comprising rock arms for moving the valves to the open position, a cam shaft for operating the rock arms and capable of longitudinal movement, and bearings for said shaft movable about

an axis parallel and displaced with reference to the longitudinal axis of the shaft.

945,489. Lifting Jack. Albert B. Cherry, Boston, Mass., assignor to Samuel Ascher, Brookline, Mass., and Thomas E. Cherry, Revere, Mass. Filed April 26, 1909. Serial No. 492,366.

1. A lifting jack comprising a frame, a ratcheted lifting bar movable therein, an operating lever fulcrumed on the frame and having an abutment on its shorter arm, a lifting pawl pivoted to the shorter arm of the operating lever, a holding pawl having a projection, means for normally maintaining the pawls continuously against the lifting bar, a tripping lever fulcrumed on the lifting pawl at a point between the abutment on the lever and the projection on the holding pawl, said lever being movable on its pivot to bring its end portions into and out of operative engagement with said abutment and projection, and adapted to trip the pawls alternately when in said operative engagement, and means for moving the tripping lever to and from its operative position.

945,585. Lubricator. Johannes T. Pedersen, Woodside, N. Y., assignor to Pedersen Manufacturing Company, New York, N. Y., a Corporation of New York. Filed Jan. 8, 1909. Serial No. 471,249.

1. In a lubricating device, the combination with a sight-feed device and a means for passing the oil visually therethrough, of a valve of two connected coacting members adapted in opposite positions to close off the feed and return and in intermediate positions to regulate the extent of flow in both directions.

945,613. Vehicle Chock. Theodore Scherf and Howard W. Merrick, Cleveland, Ohio. Filed June 24, 1909. Serial No. 504,032.

1. A chock for securing vehicle wheels during shipment comprising a body which is concaved longitudinally and transversely to conform to the co-operating portion of the wheel, feet projecting from the lower end of said body by means of which it may be secured to the floor of the transporting conveyance, and legs for the upper end of said body having means whereby they may be secured to said floor.

945,649. Tire Protector. James C. Waring, Ashland, Ohio, assignor, by direct and mesne assignments, to Guy V. Krichbaum, Ashland, Ohio. Filed Dec. 8, 1908. Serial No. 466,493.

1. A liner for tires comprising a piece of absorbent flexible material impregnated with a vulcanizable rubber solution.

945,725. Vehicle Spring. Charles A. Lieb, New York, N. Y. Original application filed Dec. 10, 1906, serial No. 347,225. Renewed Aug. 3, 1908, Serial No. 446,778. Divided and this application filed April 27, 1909. Serial No. 492,525.

1. In combination with a vehicle spring comprising a plurality of leaves, a compensating clamp for holding said leaves in yielding frictional contact regardless of the direction of strain on the spring.

945,803. Universal Joint. Harrison Quinby, Muncie, Ind., assignor of one-half to William J. Killian, Muncie, Ind. Filed March 3, 1909. Serial No. 481,045.

1. A universal joint consisting of a pair of forked complementary shaft members, the outer face of the fork end of each shaft

member having a recess therein, a ring member having a radial bore therein to register with each of said fork ends, a bearing member adjustably disposed in each of the said bores and having its inner end recessed, a ball between each of the fork ends and the adjacent bearing member, a cap at each of the said bores adapted to close the same, means carried by the ring member between the cap and the bearing member which when the cap is tightened into position will lock the cap and the bearing member against movement.

945,890. Spark Plug. Otto C. Winestock, Perkinsville, Vt. Filed Oct. 26, 1908. Serial No. 459,644.

1. A spark plug comprising a member adapted to remain in the walls of an ignition chamber and provided with bayonet joint slots in diametrically opposite walls, another member carrying the electric terminals of the plug and having diametrically opposite projecting studs adapted to the bayonet joint slots of the fixed chamber, and a ball member pivotally connected to both studs and provided with a handle.

945,968. Drive Wheel Tire Heating Device. Julius A. Hahr, Minneapolis, Minn. Filed July 14, 1909. Serial No. 507,532.

1. In a tire heating device, a channel shaped sheath made up of segmental sec-

tions connected for hinge-like closing and opening movements, formed at its upper portions with an opening for the discharge of the products of combustion and provided at its lower portions with flame supplying means, substantially as described.

946,044. Wheel Tire. Howard H. Hodgson, Toronto, Ontario, Canada. Filed June 4, 1909. Serial No. 500,099.

1. A tire section comprising a rubber section having lateral flanges at each side of its base and a projection at the under side of the base; and a metal sheath embracing the base and lateral flanges of the section and provided with an opening for the projection on the base of the section.

946,057. Brake. Edwin B. Knowles, Bridgeport, Conn. Filed July 1, 1909. Serial No. 505,356.

1. A brake comprising a rotary disc, a brake band inclosing the disc, anchor plates mounted to oscillate, studs connected to the ends of the brake band and loosely connected to the anchor plates, an operating lever pivoted on one of the studs and a connecting rod pivoted to said lever and connected to the other stud.

946,101. Inflating Pump for Motor Vehicle Tires. Max Bohne, Berlin, Germany. Filed Nov. 28, 1908. Serial No. 464,918.

When you sell accessories and supplies your profit is meager or generous, according to how you have bought them, and that is a real reason why you should have a Post & Lester Co.'s catalog and CONFIDENTIAL net trade price book—which costs you nothing.

"How is it," some dealers ask, "that you are able to give such splendid service to Middle West and Southern dealers as well as to the New England trade, without your having a New York or Chicago headquarters?"

Perhaps we can give you a hint of how we do it, by saying we could have a New York or Chicago place the minute we want it. But we don't want one. Enormous expenses are saved in rent for offices, shipping departments, stock rooms and storage space by our having them outside the expensive metropolitan district.

We do business on an enterprising, thrifty, economical and progressive basis, without lavish and extravagant mahogany desk and fifty-cent cigar settings, but with a big cash capital that takes every discount and that gives us every buying advantage.

Then, too, we have been handling automobile accessories for 16 years, supplying the experimenters long before motor cars

generally were placed on the market, and selling to automobile manufacturers and dealers ever since, so that our experience makes us the closest buyers in the business, as the accessory manufacturers sometimes confess with wry faces.

But if we are close in our buying and in our own expenses for doing business, it is in order that we may be liberal with the dealers, on whom our business depends; and the low prices and progressive policy which we give you will make your accessory department a success.

Consult with us freely, and write immediately for the big 1910 Post & Lester Co.'s catalog of standard accessories and supplies and the CONFIDENTIAL net trade price book. Do not send a postal, but show us your business letterhead or card, and then we'll know you are actually in the trade and we will be able to talk to you freely. Address GENERAL SALES MANAGER.

**The Post & Lester Co.**  
HARTFORD, CONN.

Warehouses and Shipping Depots in Boston, Mass.; Hartford, Conn.; Springfield, Mass.; New Haven, Conn.; Bridgeport, Conn.

1. In combination with the axle of a driving wheel of a motor car and the like having a projecting portion on one side, a detachable coupling having a sleeve thereon engaging said projecting portion, a boss permitting the sleeve of said coupling to rotate therein a casing associated with said boss which casing acts as the cylinder of a pump, a piston in said cylinder and means for transmitting motion from said detachable coupling to the pump.

946,145. Motor Vehicle Barke. Henry M. Lyman, Philadelphia, Pa. Filed May 20, 1909. Serial No. 497,341.

1. The combination with a pair of steering wheels of devices for braking the respective wheels equally in a straight ahead movement and means whereby the actions of said devices are automatically differentiated in turning so that greater braking force is applied to the inner than to the outer wheel.

946,465. Steering and Motor Controlling Mechanism for Automobiles. Charles Schmidt, Cleveland, Ohio, assignor to The Peerless Motor Car Company, Cleveland, Ohio, a Corporation of West Virginia. Filed Jan. 15, 1906, Serial No. 296,105. Renewed June 10, 1907. Serial No. 378,287.

1. The combination of a rotatable hollow steering column, a rotatable member mounted upon and projecting into the upper end of said column and having a threaded portion within said column, means preventing the endwise movement of said member, a tube longitudinally moving in the steering column and having a threaded portion with which the threaded part of said member engages, a reciprocatory rod passing axially through said member and through said tube, means mounted upon said member for moving said rod endwise, a handle secured to said member for turning it.

## Over 60 Per Cent. of Pressed Steel Automobile Frames

on American cars are of our manufacture. Our splendid new plant, 1,025 ft. x 286 ft., is now in operation with a press equipment capable of producing over 1,000 sets of frame parts in a single day.

Send us blue prints of your 1911 frames for quotation.

## MUST BE CAREFUL OF LABOR LAW

**Motor Car Manufacturers Seeking Men  
Otherwise May Invite Federal Prosecution—Suit Against Matheson.**

That automobile manufacturers, in their scouring for skilled labor to meet their demand for men, may unconsciously run foul of the immigration laws is indicated by a suit which has been brought by United States District Attorney C. B. Witmer, in the United States Court against the Matheson Motor Car Co., of Wilkes-Barre, Pa. The action is for alleged violation of the immigration law of February 20, 1907, in that the company extended its search for skilled mechanics to Canada.

It is alleged that the defendants advertised in the "Spectator," a newspaper of Hamilton, Ont., for skilled workmen, with wages running from 20 to 40 cents an hour. William B. Lane, a subject of the British crown, answered the advertisement and was given employment in the lathe department at 27½ cents an hour. According to the United States attorney, this is a violation of the law, which states that alien laborers shall not be imported into the United States when there is unemployed labor here to meet the demands.

As practically all of the large makers of cars are reaching out in every direction with a view to securing more men in their production departments, the dangers of inadvertent violations of the contract labor law, incident to securing skilled help, are not to be disregarded. Negotiations to obtain workmen from Canada or abroad, while reflecting enterprise on the part of the employment departments, present the possibility of grave legal consequences.

### Krausz to Sell Overlands Abroad.

Sigmund Krausz has been appointed manager of the foreign department which the Willys-Overland Co., of Toledo, O., has established with a view to entering actively

into the export field. In the latter part of April he will go to Europe with a complete line of samples, and with the assistance of an expert from the factory will demonstrate Overland cars and place European sales agencies. E. G. Eager has been sent to Hawaii, Australia and British Africa on a similar mission, while T. C. McMillan, assistant to Krausz, will remain in charge of the office end of the foreign department.

### Flanders a Studebaker Director.

Walter E. Flanders, president and general manager of the E-M-F. Co., of Detroit, Mich., and Frederick D. Stevens, of J. Pierpont Morgan & Co., were yesterday (Wednesday) elected members of the board of directors of the Studebaker Brothers Mfg. Co., of South Bend, Ind. The Studebaker Vehicle Co., of New York, recently incorporated, has certified to the secretary of state that all its capital of \$8,600,000 has been paid in, \$1,000 in cash and \$8,599,000 in property.

### Acquires Westinghouse Battery.

The Electric Storage Battery Co., of Philadelphia, Pa., whose controlling interests also are concerned in the new United States Motor Co., has acquired the patents and rights of the Westinghouse Storage Battery Co. The latter owned all the rights of the General Storage Battery Co. and the battery patents of the Westinghouse Machine Co. In the future the Electric Storage Battery Co. will have the sole right to manufacture Westinghouse batteries.

### Kelly Drops Toledo Tire Project.

Charles F. U. Kelly has "passed up" Toledo, O., as the location for his proposed tire and rubber company. He has notified the president of the Toledo Chamber of Commerce to call all deals off, as the delay of Toledo citizens in raising the \$100,000 asked of them indicated too much indifference. Kelly says a city further west subscribed \$200,000 for his project within ten minutes after it was presented.

## RUN TO EARTH IN A WOOD SHED

**Difficult Search for "Michigan Six" Plant—  
Promoters Receive Some Unsolicited  
Publicity in Detroit.**

Exceptional boldness and ingenuity in exploiting an automobile stock selling proposition may sometimes lead to extremely embarrassing results, as apparently is the case with a Detroit project, known as the Michigan Motor Car Mfg. Co., Ltd., which in addition to having a car called the "Michigan Six," also has a number of beautifully engraved certificates that it is willing to trade for the real money of investors. So aggressive and important a "front" has been assumed by the promoters that investigators have been tempted into an inquiry as to their "backing," and the results appear highly illuminating in showing the modest equipment that is necessary to create a stir in the automobile promotion field.

During the week of the Grand Central Palace show in New York, there appeared at the curb in front of the building a six cylinder machine in lead gray, bearing big signs proclaiming it the "Michigan Six," and indicating a price of \$1,550, or thereabout. Such inquirers as asked about deliveries and trade terms had difficulty in learning anything definite, but since that time the Detroit office has not hesitated to suggest the great success the car met in the East and has gone so far as to proclaim a sale of \$3,040,000 worth of its cars to a Philadelphia purchaser, involving 1,904 machines and which was announced as the "biggest single sale of cars since the inception of the motor car industry."

With more enterprise than discretion, however, the promoters executed an even bolder stroke by thrusting the Michigan Motor Car Mfg. Co., Ltd., into the arena of advertising warfare between the Association of Licensed Automobile Manufacturers and Henry Ford, the latter being somewhat surprised, if not annoyed, to find

the Michigan company taking half-page spaces in the newspaper to say that it stood with him in his fight, and to champion him as the pioneer of the industry, while hurling defiance at the Selden camp, and guaranteeing "every purchaser of a Michigan Six against litigation."

The Ford Motor Co. having denied any relation or connection with the "Michigan Six" or its makers, an investigation was undertaken by the Detroit "Saturday Night," a weekly newspaper, as to who and what the Michigan Car Mfg. Co., Ltd., might consist of, and the search developed more or less astonishing results. After failing to get much satisfaction at the offices of the enterprise, a representative was sent to Rochester, Mich., which is named as the location of the company's factory.

He was directed by a townsman to an abandoned sugar plant in the hollow of a big farm, the building being at present occupied by a concern known as the Holmes Gas Engine Works. There he was told that the "Michigan Six" headquarters were in "the knitting mill," in a distant part of the village. At the knitting mill he was told to go to the cement factory of the Twentieth Century Tile Roofing Co., a small, one-story building, at the rear of which was a wood shed containing two automobile bodies said to be the property of the Michigan company.

Although he found no evidence of automobile manufacture, he was told that the company would locate its new factory in the abandoned sugar plant as soon as the gas engine people could be induced to move out. A second visit to the sugar plant revealed the presence of C. A. Hamilton and L. D. Sullivan, named on the letter heads of the concern as secretary and purchasing agent, respectively. Their visitor took a photograph of the building.

When matched with the attractive literature which the company issued from its Detroit office with a view to persuading investors to buy stock, the present factory equipment has its deficiencies, especially as "a limited number of interests will be disposed of at par value of \$100. After which a number will be sold at \$150 an interest. The remaining interests will be held at \$200 an interest." No small part of the company's printed matter is given over to reciting the success of Ford and E-M-F., and indicating the fortunes made by holders of stock in those concerns. The officers, in addition to Hamilton and Sullivan, include Stanley Gamble, president; Jesse Dort, vice-president; Fred Hatcher, second vice-president; Rowland Hatcher, sales manager, and H. O. Carter, treasurer. Critical observers in Detroit are curious as to how the wood shed and the sugar plant are to take care of even the Philadelphia order under their management, and as to how many investors will be found, following the unlooked for additional publicity which the concern has received as a sequel to its own publicity efforts.

### THE WEEK'S INCORPORATIONS.

Dallas, Tex.—Mitchell Auto Co., under Texas laws, with \$10,000 capital.

Cleveland, O.—Reed Motor Car Co., under Ohio laws, with \$50,000 capital.

Detroit, Mich.—Pasadena Garage Co., under Michigan laws, with \$2,000 capital.

Kansas City, Mo.—Bond Motor Car Co., under Missouri laws, with \$3,000 capital.

Ogden, Utah.—Inter-Mountain Motor Car Co., under Utah laws, with \$25,000 capital.

Milford, Pa.—Milford Automobile Co., under Pennsylvania laws, with \$6,000 capital.

Denver, Colo.—Dustin Auto Top & Slip Lining Co., under Colorado laws, with \$10,000 capital.

Nashville, Tenn.—Howard-Gregor Co., under Tennessee laws, with \$50,000 capital; general automobile business.

Toledo, O.—E. C. Russell Mfg. Co., under Ohio laws, with \$25,000 capital; to manufacture automobile parts.

Detroit, Mich.—Sibley Motor Co., under Michigan laws, with \$80,000 capital. Corporators—Clyde P. Warner, Eugene Sibley and Ralph S. Moore.

Waterford, Conn.—New London Road Motor Co., removed to New London and charter amended to permit it to engage in the automobile business.

Winona, Minn.—Winona Motor Co., under Minnesota laws, with \$20,000 capital; to manufacture automobile motors. Corporators—Al Clausen and others.

Detroit, Mich.—Lewis Motor Equipment Co., under Michigan laws, with \$25,000 capital. Corporators—Robert F. Monroe, Charles E. Turner and others.

Chatham, N. Y.—Modern Auto-Appliance Co., under New York laws, with \$12,000 capital. Corporators—Frank B. Pratt, William H. Housman and Harry A. Branion.

Anderson, Ind.—Dart Mfg. Co., reorganized under Iowa laws, with \$250,000 capital and plant removed to Waterloo, Ia.; manufacturers of motor trucks and other vehicles.

Detroit, Mich.—Taxicab Co. of America, under Michigan laws; to manufacture and operate taxicabs. Corporators—J. J. O'Connor, Thomas J. Navin and Michael P. Bourke.

Boston, Mass.—Union Drop Forge Co., under Massachusetts laws, with \$200,000 capital; general foundry and machine shop. Corporators—E. T. Ward, W. P. Everts and others.

Chicago, Ill.—Standard Limousine Co., under Illinois laws, with \$5,000 capital; to manufacture automobiles and other vehicles. Corporators—B. and C. A. Carlson and C. B. Parsons.

Goshen, N. Y.—Coates-Goshen Co., under New York laws, with \$150,000 capital; to manufacture and deal in vehicles, motors,

etc. Corporators—A. R. Coates, J. S. Coates and G. F. Gregg.

Seymour, Ind.—American Auto Co., under Indiana laws, with \$15,000 capital; general automobile business. Corporators—J. W. Cunningham, R. F. Buehner, F. R. Robertson and Anna M. Buehner.

Toledo, O.—Mutual Auto & Garage Co., under Ohio laws, with \$5,000 capital; general automobile business. Corporators—E. E. Sheppard, Charles A. Langdon, Charles E. Holt and Alvin C. Jones.

Buffalo, N. Y.—Auto Battery & Electrical Co., under New York laws, with \$20,000 capital; to manufacture automobile, electrical appliances. Corporators—T. P. Meinhard, C. B. Bleyler and Montford Ryan.

Detroit, Mich.—Carhartt Automobile Co., under Michigan laws, with \$500,000 capital; to manufacture pleasure and commercial cars. Corporators—Hamilton Carhartt, Sr., Hamilton Carhartt, Jr., and others.

Jackson, Mich.—Baker Drop Forge Co., under Michigan laws, with \$65,000 capital; to manufacture automobile forgings. Corporators—W. H. Baker, M. C. Townley, C. M. Frost, E. J. Weeks, A. S. Glasgow.

Brooklyn, N. Y.—French-American Automobile Co., under New York laws, with \$4,000 capital; general automobile business. Corporators—Joseph R. Marquette, Benedict Mandelburg and Robert W. Ferguson.

Waterville, O.—Waterville Traction Co., under Ohio laws, with \$50,000 capital; to manufacture motor trucks. Corporators—W. W. Farnsworth, D. Sheldon, A. E. Zock, Charles L. Graff, W. H. Ostrander and J. A. Fowler.

Galion, O.—Howard Automobile Co., under Ohio laws, with \$300,000 capital; to manufacture motor cars. Corporators—Adam Howard, H. A. Pounder, W. J. Geer, H. Gottdiener, B. B. Gill, Frank Faber and F. K. Berry.

New York, N. Y.—Cimiotti Garage Co., under New York laws, with \$2,000 capital; general automobile distributing business. etc.; to manufacture and repair motor vehicles, etc. Corporators—Ferdinand, Walter and Paul Cimiotti.

Chicago, Ill.—Thirty-five Per cent. Automobile Supply Co., under Illinois laws, with \$10,000 capital; general automobile, mercantile and advertising business. Corporators—Albert B. Norwalk, Samuel Rubinsky and Harry D. Simmons.

Brooklyn, N. Y.—Automobile Horn Co., of Brooklyn, under New York laws, with \$100,000 capital; to manufacture automobile horns, lamps, accessories, automobiles and parts thereof. Corporators—J. T. Allan, G. Dittmann and L. Raunheim.

Detroit, Mich.—Peerless Automobile Radiator Co., under Michigan laws, with \$20,000 capital. Corporators—Monroe M. McGrath, Edward O. Lange, Harvey A. Wernet, John A. Giddings, Fred C. Stendel, Frank G. Zens, Andrew L. Gagnon.

## DIVIDEND WELCOMES THE NOISE

**As a Result, Billings & Spencer Will Locate a Forging Plant There—Outgrowth of Night Work.**

Night work, made necessary by the demands of the automobile industry, impose peculiar troubles on drop forge concerns, to whom the motor car makers look for cranks, axles and other forged parts, but as it is an ill wind that blows nobody good it is possible that other small localities will profit like Dividend, Conn., for which noise has won a drop forge plant. The new plant is to be a Billings & Spencer Co. enterprise, and is made necessary partly by the fact that residents of Hartford, Conn., who live near the company's main drop forge plant at Russ and Lawrence streets, will not permit it to run in the dark watches of the night, as would be required if it were to be operated 24 hours per day.

The Hartford plant having reached the limit of its capacity when confined to hours that the neighbors consider reasonable, a location out in a small country place was decided upon for a new establishment which can run night and day if need be. The site selected is in Dividend, part of the town division of Rocky Hill, Conn., and is near a factory already established there by the C. E. Billings Mfg. Co. The town authorities have agreed to build a highway from the site to the main macadam road between Rocky Hill and Middletown, and to make a concession in taxes for ten years. The new plant at first will consist of a drop forging shop 150x70 feet, and a power house, and will be equipped with some of the heaviest hammers now at the Hartford shop. It will be built on the railroad and will also have a dock for Connecticut river boat shipments.

F. C. Billings, vice-president and superintendent of the company, says that the history of forging plants supplying the automobile trade is all very much the same in relation to night work. The neighborhood may tolerate the noise of heavy hammers for a good part of the 24 hours, but will not permit plants of this kind to run both night and day.

### Rapid's Manager Answers Last Call.

Harry G. Hamilton, general manager of the Rapid Motor Vehicle Co., treasurer of the Cartcar Co., and a director in the General Motors Co., died at his home in Pontiac, Mich., on Sunday, 20th inst., his death being due to Bright's disease. His family name was Coadby, and he was born in Rochester, N. Y., November 3, 1861. In his childhood he was adopted by a Dr. and Mrs. Hamilton, whose name he took. After being a newsboy and later a bellboy in Pontiac, he went into the drug business at 16 years of age, and five years later headed a

company of his own. In 1891 he sold out and with A. G. North as partner, organized the Pontiac Spring & Wagon Works, which still continues, but some of the factories of which have been given over the Cartcar Co. Six years ago he and his partner entered a partnership with Morris and Max Grabowsky, forming the Rapid company, to which he devoted himself.

### Selden Licenses to Meet at Banquet.

In order that the licensees under the Selden patent, new and old, may get together in the flesh and see how vast and imposing a company they make, the Association of Licensed Automobile Manufacturers will give a dinner on April 7 at the Hotel Astor, New York, which will be attended by the officers of the licensed automobile manufacturing concerns, who with the expected additions will number 80 or more before that date. The committee in charge consists of H. B. Joy, chairman; H. A. Lozier, Albert L. Pope, Benjamin Briscoe and R. E. Olds.

### U. S. Motor Adds to Its Staff.

L. A. Latta, formerly of the Racine Wagon Co., has been added to the staff of the United States Motor Co. He will act as assistant to Secretary Dorman. The company also has acquired Webb Jay, a veteran racing man and dealer, who will handle the Columbia car in the Maxwell territory controlled by District Manager J. I. Handley in the Central and Southern States, with headquarters in the new Maxwell building, 1735 Michigan avenue, Chicago.

### Will Handle Magnetos in Michigan.

The Michigan Magneto Co. is the style of the most recent accession to the Detroit trade. It has located at 117-119 Bagley avenue and will handle magnetos exclusively. Henry G. Cox, formerly vice-president and sales manager of the Hercules Electric Co., Indianapolis, Ind., is president and treasurer of the new concern. The other officers are A. S. Cox, vice-president, and B. W. Cox, secretary.

### To Produce Wagons in Minneapolis.

For the purpose of manufacturing a light delivery wagon, the Ceerac Motor Co. has been organized in Minneapolis, with George H. Richards as its manager. Richards previously was second assistant treasurer of the Farmers and Mechanics Savings Bank in that city. Pending the location of a factory he has established an office at 420 South Fourth street, Minneapolis.

### President Clifton Returns from Vacation.

Col. Charles Clifton, of the Pierce-Arrow Motor Co., Bualo, N. Y., and president of the Association of Licensed Automobile Manufacturers, arrived in New York this week, returning from his vacation trip to Jamaica and the Isthmus. He indicates much benefit to his health as the result of the trip.

## "CERTIFIED CHECK MAN" JAILED

**Proves to be a Government Clerk with Automobile Appetite—How He Posed as Brick Manufacturer.**

Declared to be "the certified check man," who has been swindling automobile dealers by obtaining cars and giving fake certified checks in payment, Robert Harris, a clerk in the ordnance department of the United States proving grounds at Sandy Hook, was arrested on Saturday, 19th inst., and held on the charge of attempted grand larceny. It was alleged that he presented a forged certified check for \$3,175 to the Roskam-Scott Co., 1780 Broadway, in payment for a car.

According to the police, the man opened negotiations with the automobile dealers two weeks ago by writing on a letter head purporting to be that of John M. Wilson, manufacturer of bricks at South Amboy. The letter head bore a beautifully engraved cut of a brick factory, and the letter was signed "John M. Wilson."

Later the supposed Wilson turned up, and after looking over the line of machines finally decided on a car at \$3,150, and on Friday paid \$100 in cash to bind the bargain.

On Friday afternoon, the police say, the firm sent a representative to look up the customer, and found that neither John M. Wilson nor his factory could be located. The detective bureau was then notified.

Harris appeared Saturday and offered a check for \$3,175 on the National Bank of South Amboy, which was accepted by the firm, and Policeman Shibles got the task of piloting "Wilson" and his car to South Amboy. Shibles drove to the branch detective bureau and put his passenger in jail.

Harry Pike, of the Chalmers-Detroit company, said that Harris was the man who had attempted to purchase a machine from that company about a year ago, using similar means. He said that several dealers from Philadelphia would be in court to attempt to identify the prisoner as the man who has offered to sell new cars to them, giving various excuses for having to make a quick sale at a sacrifice. The American Bankers Association also is expected to take a hand in the case.

Pike said that automobile dealers had been on the lookout for a swindler who has come to be known in the trade as "the certified check man." His plan was to write on a letter head bearing the name of some manufacturing concern, that he was in the market for a car. Later he would appear, select a machine and leave a small deposit, returning a few days later, after banking hours, with a certified check. Meanwhile he would be negotiating with a dealer in another city for the sale of the car at a low price.

## IN THE RETAIL WORLD.

A. D. Spencer has invested in a new garage in Monongahela, Pa.

Sidney H. Hahn has opened a new garage in Jerome lant at Sheepshead Bay New York.

The Star Automobile Co., of Nevada, Ia., began business in that place. Cole cars will be featured.

The Smith-Role Co. has opened a new garage at 21 West Fifth street, Oklahoma City. The concern distributes Cadillacs.

A. F. Sams has been appointed receiver for the Winston Automobile Co., Winston-Salem, N. C., and filed a bond for \$2,000.

Abner Powell, New Orleans, La., has acquired a new garage on Canal street. He represents the White and Hupmobile cars.

The Twin City Taxicab Co. is erecting a large garage in Minneapolis, Minn. The building will be 70x150 feet, of cement and hardwood.

Buroff & Hafenmeister, Watertown, Wis., have purchased the automobile business of R. A. Fuller. The latter severs his connection entirely.

St. Louis, Mo., is the latest city to be honored with an Overland branch; it is styled the St. Louis Overland Co., and is located at 2832 Olive street.

B. H. Kyger has embarked in business in Waco, Tex., and will represent the Ohio car. His territory comprises half a dozen counties in central Texas.

K. O. Lee has added automobiles to his threshing machine business, and opened a garage at Aberdeen, S. D. Jackson, Fuller and Moline cars will be shown.

Wm. H. Durphy, of San Francisco, Cal., who styles himself "Motor Delivery Service Expert," has moved into more commodious quarters at 141-151 Grove street.

Dr. F. M. Reynolds, of Montpelier, Ind., has gone into the automobile business and established headquarters in the Herald building. He has the agency for the Maxwell cars.

Harry P. Branstetter, the Chicago agent for the Kisselkar, is preparing to move into new quarters at 2515-17 Michigan avenue. The building, costing \$75,000, is nearing completion.

The Inter-State Automobile Co., Minneapolis, Minn., has leased new and commodious quarters at 111-13 Central avenue. Its lines comprise the Inter-State and Paige-Detroit cars.

The Holt-Boone Motor Co., successors to Jesse Rankin Holt, have removed to the old E-M-F. quarters on Edgewood avenue, Atlanta, Ga., Demot, Marmon and Varsity cars are sold.

On April 15, the Pope-Hartford Co., Newark, N. J., will remove to new and larger quarters at Halsey street and Branford place. It now is located at Cedar and Halsey streets.

Fifteen cars were burned in a fire which gutted the four story building occupied by the Royal Automobile Garage, 717 Hennepin avenue, Minneapolis, Minn., last week. The loss is estimated at \$50,000.

The Fanning Motor Co., Philadelphia, Pa., of which William H. Fanning is president, has opened quarters at the corner of Broad and Vine streets. Thomas and Mercer cars are displayed.

The Davis-Turney Co. has begun business in Dallas, Tex., and will dispense Matheson cars in that territory. R. H. Davis and L. F. Turney constitute the firm, which has offices in the Goston building.

Kenneth R. Montgomery and M. E. Geer have formed the Montgomery Motor Sales Co., and located at 467-469 Woodward avenue, Detroit, Mich. American and Speedwell cars form the "stock in trade."

Twenty-three automobiles were wrecked by fire which on the 16th inst destroyed the garage of J. G. Reeves, at Camden, N. J. The loss, which falls on the individual owners of the machines, is estimated at \$75,000.

The Metropolitan Motor Car Co., Seattle, Wash., is a new concern just formed to market Lozier cars in that territory. W. T. Sleddon, the former Lozier agent, is interested in the new firm, which will open a branch in Spokane.

Washington, D. C., has a new accessory concern in the Empire Auto Top & Body Co., which has been established at 1217 E street, rear, N. W. Its energies will be devoted to the manufacture and repair of tops, bodies and slip covers.

The Haynes Auto Sales Co., San Francisco, Cal., is making ready to build at Van Ness avenue and Turk street. Theirs will be a one-story structure of reinforced concrete, 50x140, and careful study has been given to the lighting scheme.

The Hokanson Automobile Co., Madison, Wis., has just opened its new three-story brick and steel garage and sales rooms at 14-20 East Doty street. The building is 77x132 feet, covers 23,000 square feet of floor space and cost nearly \$40,000.

The Krit Sales Co. has opened up at 203-205 North Broad street, Philadelphia, and will distribute the Krit car throughout Eastern Pennsylvania, southern New Jersey and Delaware; garages also have been established at Germantown and Bryn Mawr.

F. A. Baker & Co., New York City, dealers and jobbers in bicycles and motorcycles, who recently took possession of their new store at 10 Warren street, have added automobile accessories. Their lines include the United Manufacturers' products.

The White Co. is contributing to the structural and artistic beauty of Chicago, by the erection of a handsome service building at Wabash avenue and Twenty-sixth street. The structure will be four stories and will provide 100,000 square feet of floor space.

Plans have been drawn for a garage to be erected for Charles B. Calvert, Detroit, Mich., at 651 Cass avenue. It will be built of brick with concrete trimmings, 50x80 dimensions, equipped with the latest appliances and will have a capacity for 30 machines.

John F. O'Toole and Thomas Walsh have completed plans for the erection of a modern automobile garage at 800 Wyoming avenue, Scranton, Pa. The building is to be 40x100 feet, and will cost \$6,000. They have obtained the agency for the American and Cole cars.

The sales department of the Stoddard Automobile Garage and Sales Co., formerly at Twenty-second and P streets, Washington, D. C., has been moved to 1313 H street, northwest. Pierce-Arrow, Franklin and Cadillac gasoline cars and the Baker electrics are shown.

To better care for its rapidly growing trade in the territory, the Maxwell-Briscoe Motor Co. has established a southern branch at 225-227 Third avenue, north, Nashville, Tenn. It is in charge of J. J. Cohen and Dr. T. A. Mitchell, the former local Maxwell agent also is connected with it.

The United Garage Co. is the style of a new company formed to take over the garage end of the business formerly conducted by the Kirk Brothers Automobile Co., of Toledo, O. M. R. Hines is president of the new concern, while F. Kirk will continue as agent for the Thomas cars.

When the remodeling of the premises is completed the Chalmers-Hipple Motor Co., Philadelphia, Pa., will occupy the buildings at 206-8 North Broad street. Sales and service departments will utilize the entire three floors of the establishment which will cater to the wants of Chalmers and Hudson patrons.

Work has begun on the new building to be erected for the Cedar Rapids (Iowa) Auto & Supply Co., at 213-17 Fourth avenue, which, when completed will be the handsomest motor car establishment in the city. The structure will be 60x140, three stories, built of brick and concrete throughout and is expected to be ready for occupancy by May 15.

John H., and William M. Brownback, Bryn Mawr, Pa., prominent business men of that place, have purchased a half interest in the Olds-Oakland Co., St. Louis, Mo., and have been admitted to the firm. The former becomes vice-president and the latter treasurer, respectively, the other officers continuing as before.

The Winona (Minn.) Motor Co. has been formed to take over the P. Steffes Launch & Automobile Co., of that city. All the old officers retain their interest in the new concern, which in addition to manufacturing launch engines, will conduct a general automobile business. The plant is located at the foot of Johnson street.

Will B. Wreford, Detroit, Mich., who has handled the automobile department of the

Detroit Free Press for several years, has resigned to become actively identified with the selling branch of the trade. He will be manager of the Michigan sales branch of the Columbia Motor Car Co., which will be located at 243-245 Jefferson avenue.

Rebuilding second-hand cars and refinishing them so as to be able to guarantee them for a year, the Cleveland Auto Trading Co., Euclid avenue and East Fifty-seventh street, Cleveland, O., is making a bid for popular favor. S. E. Morris is manager of the company, which is connected with the Auto Trading Co., of Pittsburg, Pa.

The Philadelphia (Pa.) E-M-F. Co., which was organized in January with temporary quarters at 1231 Chestnut street, has taken possession of the new building erected for it at 342-344 North Broad street. Although one of the largest motor car establishments on the row, the new structure will be devoted to sales only; a service depot will be maintained at 1527 Natrona street.

Dr. Hobson, president of the Hobson Automobile Co., Lexington, Ky., met an untimely death while superintending the work on his new garage at 123 East Short street, on the 16th inst. He had only been in the business two weeks, and was looking down from the loft above the garage floor when the banisters gave way and precipitated him some 30 feet to the concrete floor below.

Leases have been consummated by three automobile firms of Denver, Colo., for a plot of ground with 150 feet front, at Colfax and Lincoln streets, on which new salesrooms will be erected. The concerns who will build are the Krebs-Covington Automobile Co., Overland Auto Co., and the Robertson & Doll Carriage Co. The new structures will be two stories, 50 feet front, and will cost \$15,000 each.

The Elkhart (Ind.) Garage Co., located at 200 North Main street, has been placed in the hands of a receiver on the petition of B. H. Reid, who asks judgment on a \$100 claim. The assets are estimated at \$3,500, and the liabilities at \$7,000. The company was organized November 23, 1906, with \$10,000 capital, with the following incorporators: C. G. Conn, W. J. Groner, John S. and Mary E. Landon.

With the retirement of Robert Atkinson from the firm of Schwaebe & Atkinson, Los Angeles, Cal., local Premier agents, the concern hereafter will be known as the Premier Motor Car Co., with L. H. Schwaebe as president and general manager. Coincident with the changes in personnel, the firm has taken possession of a handsome new sales building on South Olive street, where Premiers will be handled exclusively.

The Lozier Sales Co., Chicago, Ill., has been formed to distribute Lozier cars exclusively in the Windy City, and will open salesrooms at 1501-5 Michigan avenue, April 1st. James Levy, who formerly handled the Lozier, and J. H. Palmer, a recent

recruit to the trade, fill the offices of president and general manager, respectively, of the new firm. Levy retains his interest in the Levy & Hipple Co., which handles the Chalmers.

The Standard Auto Co., Houston, Tex., has been formed in that city with temporary quarters in the Paul building, to handle the Locomobile, Marmon, Packard and National. The concern will be permanently located at Preston and San Jacinto avenues upon the vacation of the premises by the present tenants, the Houston Motor Car Co. Both members of the new firm, E. E. Guthrie and G. F. Cotton, have had several years' experience in the trade, the former having been identified with the Studebakers, while the latter had the local Packard representation.

The famous "automobile row," of Denver, Colo., is in danger of being broken up by the high rentals demanded for the garages in the Broadway district. It is the general opinion among the dealers that before long they will be forced to seek other quarters, and Eighteenth avenue seems to be the popular choice. The first to make the move has been John M. Kuykendall, who is constructing a mammoth garage for gasoline and electric vehicles at Eighteenth avenue and Pearl street, in connection with his Denver Omnibus and Cab Co. venture. Other dealers are said to contemplate a similar move.

#### Firestone Opens San Francisco Branch.

The Firestone Tire & Rubber Co. has opened a branch in San Francisco at 442 Van Ness avenue. This is the third branch which the Firestone company has established on the Pacific Coast, the others being in Seattle and Los Angeles. For the latter branch the company is building a two-story brick structure, 47x155 feet, at Olive and Pico streets.

#### Two New Men on Hartford Staff.

The Hartford Rubber Works Co., of Hartford, Conn., has further augmented its selling force by two additions to its corps. Zachs C. Elkins, of Texas, and O. S. Johnson are the new men who are to help spread the gospel of Hartford tires.

#### Wright Wrench Building New Plant.

The Wright Wrench Mfg. Co., of Canton, O., has broken ground for a new plant, which is to be ready May 1, and which will increase the company's capacity to 2,000 Wright wrenches per day. It will comprise two buildings located on a three-acre site in South Canton.

#### Organize to Make Parts in Detroit.

With the purpose of manufacturing automobile parts and tools from pressed steel and brass, the Campbell-Kingsley Mfg. Co. has been incorporated under Michigan laws with \$110,000 paid in capital. The stockholders represent capital from Detroit, Trenton and Wyandotte, Mich., and many of

them are anxious to locate the factory in the latter place. Pending a decision as to a permanent location, a two story factory building has been leased for one year in Detroit, with privilege of extension. The officers are: Henry Hoehrig, of Wyandotte, president; Dr. W. H. Honor, Wyandotte, vice-president; John H. Kingsley, Detroit, secretary; Dr. N. G. Bowbeer, Wyandotte, treasurer.

#### Building Electric Coupes in Chicago.

The Ideal Electric Co. has commenced the construction of a \$1,875 electric coupe at 444 West Indiana street, Chicago, and expects to produce 500 of the vehicle during the current year. The Officers of the company are John A. Ryerson, president; S. H. Peterson, vice-president, and Carl J. Holdredge, secretary and manager.

#### Another Body Building in Indiana.

Portland, Ind., is to have a new body building factory which will supply bodies for the automobile trade. The enterprise is styled the Portland Body Works and the plant is being put up on a site formerly occupied by W. H. Hood cannery factory. The cost of the buildings is estimated at \$10,000.

#### Excelsior Supply Triples Its Room.

The Excelsior Supply Co., Chicago, has leased the Kelly-Maus building at the foot of Randolph street and shortly will remove thereto. The building is a five story structure, with basement 450x56 feet, and will afford three times as much room as the Excelsior company's present establishment.

#### Matheson Forced to Use Circus Tents.

The Matheson Motor Car Co., of Wilkes-Barre, Pa., has been driven to the tent expedient for expanding its factory space. Two mammoth circus tents have been put up on an eight acre lot, and day and night shifts are being worked in them until new factory buildings are completed.

#### More Detroiters Plan to Build Cars.

The Sibley Motor Car Co. has been incorporated in Detroit to manufacture a four cylinder 20 horsepower car at \$850. Eugene Sibley and R. S. Moore are the moving spirits, and temporary offices have been taken in the Telegraph building.

#### Chadwick and Atlas Added to Selden List.

Selden licenses this week were granted to the Chadwick Engineering Co., Pottstown, Pa., and the Atlas Motor Car Co., Springfield, Mass. These additions bring the total number of licensees to 78 American manufacturers and three importers.

#### South Carolina Joins the Procession.

State pride is being invoked in South Carolina for the first automobile manufacturing enterprise within its borders. The Rock Hill Buggy Co., of Rock Hill, has commenced making motor cars.

Some Features of the  
**White Gasoline Car**  
 which result in unusual  
**Economy of Up-Keep**

The White gasoline car is designed and built to run at a lower cost of up-keep, mile for mile, than any other car on the American market. Some of the factors which insure economy both in fuel consumption and in cost of maintenance are:

#### **Intake Gases Heated**

By including the intake passages within the block engine casting, the intake gases are heated. As a result, every particle of gasoline is completely vaporized and each cylinder receives a uniform mixture of the proper richness, thus ensuring very low fuel consumption.

#### **Exhaust Gases Cooled**

By water-jacketing the exhaust passages, the temperature of the exhaust gases is reduced as soon as they leave the cylinders. As a result, the pressure of these gases is greatly reduced and there is a minimum loss of power due to back pressure. This factor also results in low fuel consumption.

#### **Four-Speed Transmission**

The direct drive is on third gear and practically all driving in town is done on this gear. For high-speed running, the fourth gear is used. There is, therefore, no racing of the engine and no undue strains upon it when the car is run at high speed. Furthermore, the engine may always be run at very close to its most economical speed.

#### **Valve Mechanism Enclosed**

There is no chance for dirt and grit to work their way into the bearing surfaces and cause wear and faulty timing, as is the case when the valve mechanism consists of a series of external and unprotected springs, rocker-arms, push-rods, etc.

#### **Accessibility of Every Working Part**

The cost of making an ordinary adjustment on any car is determined largely by the accessibility of the several parts. In the White, accessibility has been developed to a much greater degree than in any other car. For example, as there are no external manifolds, or no overhead valve contrivances, a valve may be removed for regrinding without removing or disturbing any other part. As another example, the magneto and water-pump are on opposite sides of the engine and are driven independently, so that either may be reached without disturbing the other.

Write for catalog of the White Steam and Gasoline cars.

#### The Real Victims of Frelinghuysenism.

In New Jersey some of the opponents of the Edge bill, which sought to permit non-resident motorists to enter that state without payment of an "admission fee," brought themselves to a peculiar frame of mind. They talked of the law as an unwarranted "courtesy" to "visitors," and the Trenton Times, as a choice example, maintained that "in fairness to our own automobilists," non-residents "should be compelled to contribute" to the cost of repairing the roads. The Times also naively complained that unless non-residents are registered in New Jersey there will be no means of identifying them in case of accident, and declares that the "courtesy" is desired chiefly by Atlantic City, Asbury Park and other resorts and by

that portion of the population "largely made up of New Yorkers who come to New Jersey to sleep," who, the Trenton publication did not add, erect homes, pay taxes and otherwise spend in New Jersey the money they earn in New York.

In urging that Senator Frelinghuysen be supported in his opposition to the Edge bill, the Times said that "New Jersey is asked to give everything and can expect little in return," and adding that the rights of those who bear the burden of road maintenance "are more important than 'courtesies' to visitors," it concludes: "It is rather unusual for a guest to demand the right to destroy property of his host and run away without making compensation or apology for the loss he has caused."

It is utterances of this sort that inspire the desire to invoke the power of the national government and the hope that Federal laws may multiply. When the act of freely using the roads in any part of the country becomes a "courtesy," or the citizens of one state are considered merely "visitors" or "guests" in another state, it is time that it was made plain when the common highways ceased to be for all and when a citizen of any state ceases to be a citizen of the United States.

Quite apart from this phase of the matter, however, the Trenton Times's assertion that New Jersey gives everything and receives little in return is distinctly entertaining. For, as a matter of fact, if it were not for the money that flows into it from New York and Pennsylvania, New Jersey would be a "small potato," indeed. Why, even Senator Frelinghuysen sleeps and earns his living and performs much of his "statesmanship" in New York; letters bearing his Raritan, N. J., political address are not infrequently postmarked New York and his automobile is used more, perhaps, in New York than in New Jersey. He is a fine specimen for the citizens of any state to support!

His policy has cost New Jersey many more dollars than its "admission fee" has brought or ever will bring into its coffers. It has kept and is keeping thousands of non-residents out of the state, every one of whom would add to the tills of New Jersey-men, and not merely those in Atlantic City and Asbury Park, either. And the "fairness" of the Frelinghuysen law to the motorists of New Jersey is best shown by its effects on their pocketbooks.

Due to that law and nothing else, they must pay an "admission fee" to enter Penn-

sylvania, Delaware, Maryland and Vermont and a number of other states. It has caused them to be discriminated against on almost every side. They are the real victims of Frelinghuysenism. This is a feature of the situation which the Trenton Times and others similarly minded should not overlook. It was a one-sided affair for a while, but the worms have turned in other states and the New Jerseymen themselves now know how it feels—and what it costs—to be considered a "visitor" or a "guest" when outside of their own borders. If they can support or stand for the man who thus victimized them, they deserve to have the agony piled on them.

#### Accessories and the Jobbers.

Bad feeling and strained relations have arisen between the makers of some accessories and the jobbers over the difficulties which both find in filling orders, now that the rush of 1910 business is on. The jobbers cannot get the goods in quantities they require and the manufacturers cannot make the deliveries which are asked of them. In the tension and fever which has come about, the jobbers blame the accessory makers, and the latter are equally angry at the jobbers, each side taking the view that the other is at fault in not making proper preparations for the business that was to come.

The accessory makers complain that the jobbers are responsible for the whole trouble because they simply would not place quantity orders last fall and during the winter. According to the makers there was a most unusual reluctance on the part of the jobbers to commit themselves to big orders for future delivery, despite the certainty of demand, and the makers were left so much "in the air" that they did not deem it wise to go ahead manufacturing at full capacity during the winter without definite specifications from the jobbers to whom they looked to distribute their goods. In fact, the jobbers are accused of not fulfilling their proper functions of jobbers, in that they did not buy ahead for the season's needs and did not give the manufacturers a fair basis to work on.

On the other hand, the jobbers recognize no heavy ethical responsibilities which would compel them to place specifications early. If the accessory manufacturers were so certain of the coming demand, it is asked, why did they not go ahead and make up the goods, whether they had definite specifications or not? If they needed the money

which the jobbers would supply by early buying, the jobbers nevertheless had the right to hold off.

Underlying the whole difficulty is a matter which both the jobbers and the accessory manufacturers will have to take up more seriously than ever before, and that is the question of rock bottom prices by the manufacturers. While it may be true that the jobbers have been extremely unjobberly in that they have refused to buy at the time that they might reasonably be expected to do so, it is nevertheless a fact that they have had adequate ground in many instances to hold off, if for no other reason than that they needed time to find out the manufacturers' bottom prices.

Another element in the situation, and one for which the manufacturers as a whole are not subject to blame in any degree, is the springing up of new manufacturing concerns that aim to sell goods to the jobbers at lower prices than the older makers. While it is less true of patented and highly specialized goods which are well known to the public, there are many lines of accessories where a jobber could handle the products of one manufacturer just as well as another, so far as big quantities are concerned. On goods of this kind the jobbers not infrequently hesitate to tie up early with the older makers, as the newcomers may have more favorable prices when they actually get started. These lower prices in turn may induce corresponding prices from the older makers who feel the competition, and so, by waiting, the jobbers get more advantageous figures than by placing their orders early.

This phase of it applies particularly to those manufacturers whose goods are not known to the public or the dealers as standard brands, either through advertising or long use and exceptional merit, or through a combination of these attributes. The prices that these classes of accessories bring from the jobbers are more or less dependent on the state of the market, and their variations are what help to play hob with the proper relations of the jobbers to the manufacturing side.

Because of the present experience, both sides have reason to seek a remedy which can be put in effect before another year is out. The most promising improvement would appear to be a guaranteed price arrangement of some kind, by which the jobbers could buy early, but with the assurance that if the manufacturer later cuts

his price they will get the benefit of the new figure. As a further step toward making the jobbers feel safe in buying his goods early, the manufacturer can adopt a rigid sales policy which will permit no wide variations in price to different jobbers and which will not allow dealers and "semi-jobbers" special favors that will make it impossible for the legitimate jobbers to sell to them at a profit after loading up with the goods. Then if the manufacturer's products enjoy any reputation at all as standard articles they can be marketed through the jobbers in a business-like way.

#### Increased Vogue of Large Tires.

Advocates of large diameter wheels for automobile use are noting with complacency the conversion of one maker after another to the principle which it involves. As was noted during the early part of the current show season, the average of wheel sizes has been raised during the past two years until at the present time, for cars of medium weight and power the 34 and 36 inch diameters are most prevalent. Not only this, but the standardization of the 36 inch size by nearly all makers of large cars promises a further adoption of that type in another year. Owing to the conspicuousness of the half dozen or so of makes to which wheels of 40 or 42 inch diameter have been applied, it is hardly necessary to call attention directly to them, but it is a significant fact that still other adherents to this extreme are announced.

Some of the arguments in favor of the large wheel are obvious. For instance, it is plainly evident that the large wheel has a greater leverage in overcoming obstacles than a small one; that it will bridge depressions into which the smaller wheel will drop; that its tread being longer, it will be subjected to less wear in covering a given mileage; and that it imprisons a greater volume of air and hence offers greater resiliency than the tire of the same section but smaller wheel diameter. It is not so evident, on the other hand that, as was pointed out recently by one of the well-known tire manufacturers, the greater radius of curvature of the large tire implies less abrupt flexures at the point of contact with an obstacle; that the strain exerted on a large tire is distributed over a larger area; that the radiating surface is so large as to ensure adequate cooling at all times. These are strong arguments in favor of increasing tire sizes up to reasonable limits.

## COMING EVENTS

March 21-26, Spokane, Wash.—Spokane Automobile Dealers' Association's first annual show in Princess Rink.

March 26-April 2, Montreal, Can.—Fourth National Automobile and Sportsmen's show.

March 26-April 2, Pittsburg, Pa.—Pittsburg Automobile Dealers Association's fourth annual show in Duquesne Garden.

March 28-April 2, Indianapolis, Ind.—Indianapolis Automobile Trade Association's first annual show in individual show rooms.

March 28-29, Savannah, Ga.—Savannah Automobile Club's 675 miles endurance run to Jacksonville, Fla.

March 29-April 2, Rockford, Ill.—Rockford Motorist Association's first annual automobile show in Coliseum.

March 28-April 2, Toledo, O.—Toledo automobile dealers' individual shows in sales rooms.

April 5-6, Amarillo, Tex.—Amarillo Automobile Association's race meeting.

April 6-9, Duluth, Minn.—Duluth and Superior Automobile Club's first annual automobile show in state armory.

April 7-9, Logansport, Ind.—Second annual automobile show in Broadway garage.

April 8-17, Los Angeles, Cal.—Inaugural meet on the new Los Angeles Motordrome.

April 9-16, Elmira, N. Y.—Elmira Chamber of Commerce's first annual automobile show.

April 11-16, Harrisburg, Pa.—First automobile show.

April 11-18, Springfield, Mo.—Springfield Chamber of Commerce's first automobile show.

April 18-23, Bangor, Me.—Second annual automobile show in Auditorium.

April 30-May 1, 2, Philadelphia, Pa.—Quaker City Motor Club's roadability run.

May 2, Denver, Colo.—Start of Flag-to-Flag endurance and reliability contest to City of Mexico for Wahlgreen trophy.

May 5-7, Atlanta, Ga.—Opening spring race meeting on Atlanta motordrome.

May 9-14, Harrisburg, Pa.—Motor Club of Harrisburg's fourth annual reliability contest.

May 18-19, Norristown, Pa.—Norristown Automobile Club's third annual endurance run to Scranton and return.

June 11, Wilkes-Barre, Pa.—Wilkes-Barre Automobile Club's annual hill climb on Giant's Despair.

July 2, Wildwood, N. J.—North Wildwood Automobile Club's roadability run from Philadelphia to Wildwood.

July 4, Wildwood, N. J.—North Wildwood Automobile Club's annual beach races meet on Ocean drive.

**OLDFIELD EMULATES LIGHTNING**

**Covers Kilometer in 17.04 and Two Miles in 55.85 Seconds—Spectacular Speed on Florida Beach.**

Barney Oldfield, in his 200 horsepower Benz racer, yesterday (Wednesday, 21st inst.), once more traveled faster than man ever traveled before for the same distance when he streaked two miles in the phenomenal time of 55.85 seconds, and covered one kilometer in 17.04 seconds, both of which are world's records. The remarkable feats were accomplished on the broad level beach at Daytona, Fla., and made the second day of the meet promoted by the Florida East Coast Automobile Association stand out brilliantly as compared to the first day.

Oldfield was the shining star of the meet and his performance with his racing mastadon shows conclusively that his wonderful flight on Wednesday last, 16th inst., when he broke the world's straightaway record in 27.33 seconds, or at the rate of 131.72 miles an hour, was no fluke.

The first record to be wiped from the slate was the two miles straightaway against time, which had stood at 58 $\frac{3}{4}$  seconds since 1906, when Victor Demogeot, accomplished it with his 200 horsepower Darracq upon the same course. Oldfield, of course, got away to a flying start and the way he streaked over the sand to the wire line at the finish made the spectators hold their breaths. When it was announced that he had covered the two miles in 55.85 seconds, or 2.55 seconds faster than the former world's record, the crowd felt rewarded for the slow going of the day previous. Oldfield's flight was at the rate of 128.686 m.p.h.

The next record to receive a battering was the flying kilometer. The fastest time ever made for the distance stood at 17.76 seconds, to the credit of Hemery and the same Benz car that Oldfield piloted, and the Brooklands track in England. The world's straightaway record for the kilometer stood to the credit of Marriott, who, in his steam freak, made 18 $\frac{3}{4}$  seconds at Daytona in 1906; the best time for gasoline cars, made at the same place and time by Demogeot, was 19 $\frac{3}{4}$  seconds. Oldfield simply slashed all these records, hurtling over the marked course in 17.04 seconds, or at the rate of 131.197 miles per hour.

While these two flights, together with the mile record made exactly a week before, will go down in history as the most startling flights against time ever made by a man and an automobile, they were not the only features of the second day's racing. Oldfield and George Robertson both tried again for the mile record, but they fell short of the mark established by the former last week. In his trial Oldfield covered the mile in 28.41 seconds, or at the rate of 126.694 miles per hour. Robertson, who had just returned from New York

after a flying trip from Daytona, to attend the funeral of a relative, took his seat in Christie's front drive car, prepared to better Oldfield's time. Robertson, however, fell short of the mark, his best time for the mile being 30.39 seconds, while on a second trial he was clocked in 32.36 seconds. Oldfield made a second trial in 32.18 seconds.

Another noteworthy performance accomplished by Oldfield was when he tried his Knox car at the mile distance from a flying start against time. The Warner electrical timing apparatus registered 40.35 seconds, which, so far as is known, is the best time ever made by a stock car. The speed works out at the rate of 89.219 miles per hour.

Seven cars started in the 10 miles free-for-all handicap, and one-sixteenth mile separated the first three finishers. The victory went to W. E. Davis, whose Mitchell car was allotted a handicap of 5:25. Gus Grosjean in a Pope-Hartford, with 2:45 handicap, was second, and Oldfield, driving his Knox from 1:30, was third. Davis's time was 12:13. In the 10 miles free-for-all stock cars, Oldfield, in a Knox, and Ormsdorf, in a Chalmers-Detroit, were the only starters, and the former won by three feet in 8 minutes 0.43 seconds. In the so-called 10 miles Florida championship Grosjean, in his Pope-Hartford, enjoyed a walkover in 9:41, the other starter, R. M. Bond, in a Stearns, not finishing.

The day was ideal for record breaking, as is apparent, and an even larger crowd than on Tuesday viewed the events. It was noticeable that the dozen soldiers who patrolled the course on the first day in regulation uniforms and carrying guns and bayonets, were conspicuous by their absence. It was understood that Captain Cowan would not allow them to perform patrol duty, as representing the state. The day's summary follows:

Two miles against time, flying start—By Barney Oldfield, Benz. Time, 0:55.85 (world's record).

One kilometer against time, flying start—By Barney Oldfield, Benz. Time, 0:17.04 (world's record).

One mile against time, flying start—Oldfield, Benz, first trial, 0:28.41; second trial, 0:32.18. Oldfield, Knox, 0:40.35. George Robertson, Christie, first trial, 0:30.39; second trial, 0:32.36.

Ten miles free-for-all handicap—Won by W. E. Davis, Mitchell (5:25); second, Gus Grosjean, Pope-Hartford (2:45); third, Barney Oldfield, Knox (1:30). Time, 12:13.

Ten miles free-for-all stock cars—Won by Barney Oldfield, Knox; second, Harry Ormsdorf, Chalmers-Detroit. Time, 8:00:00.43.

Ten miles for "Florida championship"—Walkover for Gus Grosjean, Pope-Hartford. Time, 9:41.

Tuesday was ideal for speed-making performances. A strong breeze came from the southwest, the course being laid out from the club house south, so that the drivers

had the wind at their backs on the home-stretch. The coquina-shelled sand was packed firm and smooth, and with the aid of ropes the local police, reinforced by about a dozen soldiers of the First Regiment of Florida, in uniform and with muskets, there was no difficulty in keeping the people off the course.

Although the times made in the three stock car events that were run were unusually slow for the Florida beach, the finishes were close enough in every instance to be exciting. There were four starters in the so-called 10 miles Southern "championship," which, however, was open only to residents of Florida driving stock cars. Gus Grosjean, driving a Pope-Hartford, won by three feet from R. M. Bond, at the wheel of a Stearns, the time being 9 minutes 0.27 seconds. W. E. Davis, in a Chalmers-Detroit, came in third, and E. Hildebrandt, Mitchell, was fourth.

The 10 miles free-for-all handicap was the best filled event of the afternoon, eight cars starting, with David Bruce-Brown, in a big Benz, on scratch. Oldfield chose to drive his Knox, and received an allowance of 1 minute 30 seconds. The prize was a trophy donated by Allen Whiting, of the Automobile Club of America. Harry Ormsdorf, in a Chalmers-Detroit, with 2 minutes 30 seconds handicap, finished first in 9:09.20, with M. B. Aultman, Hudson, second. The latter had 6 $\frac{1}{2}$  minutes handicap. Another Chalmers-Detroit, driven by Hildebrandt, came in third. The handicaps were too much for Oldfield, Bruce-Brown and Bond to overcome.

Oldfield had his innings in the 20 miles free-for-all for stock cars, driving his Knox to victory in 18 minutes 0.60 seconds. He won by less than a foot from Grosjean, who drove a clever race in his Pope-Hartford. Ormsdorf was leading at the turn, but stalled his motor.

The mile speed trials and a five miles race for the big cars were scheduled, but the rapidly incoming tide short circuited the electrical timing apparatus and Oldfield and Christie were compelled to abandon fast work for the day. The summaries for Tuesday follow:

Ten miles for "Southern championship"—Won by Gus Grosjean, Pope-Hartford; second, R. M. Bond, Stearns; third, W. E. Davis, Chalmers-Detroit; fourth, E. Hildebrandt, Mitchell. Time, 9:00.27.

Twenty miles free-for-all, stock cars—Won by Barney Oldfield, Knox; second, Gus Grosjean, Pope-Hartford; third, Harry Ormsdorf, Chalmers-Detroit. Time, 18:00.60.

Ten miles free-for-all, handicap, for Whiting trophy—Won by Harry Ormsdorf, Chalmers-Detroit (2:30); second, M. B. Aultman, Hudson (6:30); third, E. Hildebrandt, Chalmers-Detroit (5:25). Time, 9:09.20. Also ran—Barney Oldfield, Knox (1:30); R. M. Bond, Stearns (2:30); W. E. Davis, Mitchell (6:00), and David Bruce-Brown, Benz (scratch).

## WALL STREET IDEA OF AMATEURISM

**Projector of New Association Talks of Its Aims and Regulations—Why It Won't Affiliate with A. A. A.**

With the sole object of promoting automobile contests for its members, who are supposed to be amateurs, although the constitution and by-laws are not very explicit upon that point, the Amateur Automobile Contest Association has been formed in New York City, and will be incorporated under the laws of the state of New York within a few days.

Nearly all the officers and a majority of the members of the new organization are prominent brokers and financial men rated high in Wall Street, and the club has sufficient capital and influence, it appears, to carry out its plans. The officers of the Amateur Automobile Contest Association are:

President, Northrup Fowler; vice-presidents, Richard M. Jesup, Henry H. Law and John Rutherford; secretary-treasurer, J. Gilbert Wilson; directors, the officers, J. D. Tooker, Clarence M. Chauncey, Charles A. Fowler, Jr., and Jonathan Thompson.

In view of the fact that the Amateur Automobile Contest Association appeared to mark the first serious step toward genuine amateurism and that it was designed to fill the role of a national association, and in doing so, might cross the American Automobile Association, the Motor World sought the officers of the organization to ascertain if this might be the case, and also to learn its definition of an amateur. When interviewed in his office at 7 Wall street, Richard M. Jesup, one of the vice-presidents of the association, said:

"The idea of an amateur automobile association was conceived at a dinner Henry Law, the promoter of the Briarcliff race, and I, had together. We talked it over among a lot of fellows and they all agreed that there should be automobile contests where the man who buys his car and drives it himself could compete upon an equal basis with others of his kind. The result was the formation of the Amateur Automobile Contest Association.

"Any person who joins our association must own his car, he cannot be connected with the automobile trade either directly or indirectly, and in contests that we promote he cannot be helped in any particular whatever by the manufacturers. Any person who accepts gratuities of any kind will be barred from the association."

"What is the scope of your organization? Do you intend to become a national body?" Mr. Jesup was asked.

"There is nothing in our rules to prevent us from becoming a national body, although that is not our present intention. We simply are forming a club or association to

promote purely amateur contests, and to provide plenty of sport for our members," he replied.

When asked if the Amateur Automobile Contest Association would affiliate with the American Automobile Association or run under its rules, Mr. Jesup replied with some asperity:

"Why should we affiliate with anybody? We have money enough to stand on our own legs, and to make our own rules, which is what we intend to do."

So far the Amateur Automobile Contest Association has not arrived at a definition for an amateur, but it is supposed that this will be attended to when the rules of the association are adopted next week. The only thing in the by-laws which has any bearing upon the subject is Section 2 of Article 6, which reads:

"No person shall be eligible for membership who is interested financially in the sale of motor cars or other accessories, or who in any way can be considered as even indirectly affiliated with the manufacturing of or sale of automobiles, their parts or accessories."

When it was pointed out to Vice-President Jesup that this did not define an amateur, he said that doubtless the definition of an amateur would be taken up at the meeting which will be held to adopt rules for competition some time this week.

The first contest of the association will be a hill climb on Saturday, May 28th. The course already has been chosen, but pending official confirmation of the granting of the use of the road for that day the officers do not care to make the exact course public. It is in White Plains, N. Y., however, and is exactly one mile long. Three classes will be arranged for, classified according to piston displacement.

It is announced that the association will hold a road race some time during the summer, but it will not be held over the Briarcliff course, as has been stated in several papers, and will have no connection with that event. Mr. Jesup states that the road race will be a handicap affair, with the handicaps based on piston displacement.

### Extra! Clews's Car Fouls the Law.

Henry Clews, the New York banker whose name and money constitutes nine-tenths of the so-called National Highway Protective Society, was hoist by his own petard on Sunday last, and as a result broad grins are the rule. Mr. Clews and his society believe that anything akin to lynching is none too good for violators of the speed laws and the anti-smoke ordinance. But alas! on Sunday last a policeman in Central Park gathered in the Clews chauffeur for not only speeding, but for permitting the Clews car, in which Mrs. Clews was a passenger, to belch smoke. It naturally is expected that both the banker and E. S. Cornell, the chief factotum of his little national society, will urge that the offender be given the limit of the law.

## PROTESTS AGAINST PROPOSED FEES.

**New York State Association Suggests More Moderate Scale in New Law—Webb is Chosen President.**

With the delegates present from 13 affiliated clubs, the New York State Automobile Association held its annual meeting at the Long Island Automobile Club, Brooklyn, last week and elected officers for the ensuing term as follows: Frank G. Webb, Long Island A. C., president; S. C. Tallman, A. C. of Auburn, first vice-president; Clay W. Holmes, Elmira A. C., second vice-president; B. B. Nostrand, Jr., Peekskill A. C., third vice-president; Bert Van Tuyle, Rochester A. C., secretary; W. H. Smith, A. C. of Syracuse, treasurer; directors-at-large, H. A. Meldrum, Charles Thaddeus Terry and A. G. Batchelder.

Owing to the changing of the date of the annual meeting the newly elected officers will hold office until December, 1911. The secretary's report testified to the degree of his activity, 14 new clubs having been admitted and four reorganized during the year, giving a total of 46 affiliated clubs with combined membership of over 6,000, an increase of 1,547. The treasurer's report showed the association to be in a prosperous condition with a comfortable surplus on hand.

In a general discussion of the proposed new state automobile law, the following pointed resolution, drawn by Chairman Terry, of the A. A. A. Legislative Board, was passed:

Whereas, The New York State Automobile Association has always maintained and probably will insist that there is no jurisdiction in law or reason for the imposition of any tax upon motor vehicles other than a tax upon it as personal property according to its value, and

Whereas, The State Association again goes on record as opposing any tax, whether it be called registration fee or license fee or plainly a tax levied exclusively upon motor vehicles for the privilege of using the highways, be it

Resolved, Nevertheless that if the Legislature insists upon the imposition of a tax upon motor vehicles for the use of the highway, whether it be called registration fee, license fee or by some other name, that the association would never acquiesce or remain passive if any attempt is made to impose any registration fee or tax higher than the following—to-wit—\$3 on cars of 20 horsepower or less, \$5 on cars of from 21 to 29 horsepower, inclusive, and \$10 on all cars of greater than 29 horsepower.

In response to an appeal from S. C. Tallman of the Auburn Automobile Club, the sum of \$200 was appropriated towards guaranteeing the establishment of a ferry across Cayuga Lake during the closing of the roads through the Montezuma marshes for reconstruction. The roads will be closed during the entire year, hence the necessity for the ferry service.

## KANSANS' REMARKABLE VEHICLE

Striking Illustration of Manifold Utility of Engine—Railway Gang Car that Serves Varied Purposes.

Of all the utilitarian uses to which the gasolene engine has been put, few, if any, are more remarkable or more varied than those made possible by the Au-Tra-Kar, as the little vehicle developed and recently

two side shafts for furnishing power. These power shafts seen longitudinally on each side of the car have standard taper shanks at each end, thus giving four points at which flexible or telescoping shafts can be attached. The two clutches, one for use in driving the car and the other for transferring the power to the side shafts, are plainly shown.

The Au-Tra-Kar is particularly adapted to the placing of screw spikes, the one considerable factor preventing the general

clutch which is adjusted to slip when the spike has been set down to the desired degree. Without this friction clutch the engine would be stalled or the head of the spike twisted off. The telescoping shaft between the motor and the spike driver allows of reaching three ties without moving the car. While the man handling the spike driver is guiding the drilling operation, the man at the rear of the car is directing the mechanism which screws the spikes into place, so that neither time nor labor is

"AU-TRA-KAR" WITH ITS TRACK-LAYING AND REPAIR MECHANISM IN POSITION

placed on the market by the Railway Specialties Co., of Atchison, Kan., is styled. It is at once a section-gang car, an auxiliary locomotive, a power plant for roadside shop, and a drilling and spiking machine. While one end of it is engaged in drilling holes for spikes, the other end is screwing the spikes into place. It seems to solve not a

adaptation of which instead of nail spikes has been the great expense of putting them in by hand methods. The new contrivance, however, is claimed to permit of a ten times greater speed in the boring of holes and screwing in of spikes than was attainable before, in fact it is asserted by the makers of the Au-Tra-Kar that by this new method

wasted. The number of ties annually required for railroad use is about 154,000,000, valued at \$77,000,000, and as each tie carries eight spikes, it can be appreciated that an enormous amount of labor is employed in the mere driving of these spikes into the wood, and what a saving the Au-Tra-Kar may effect.

SHOWING THE FEATURES AND RAIL-SPIKING OPERATIONS OF THE "AU-TRA-KAR"

few of the expensive problems of railway maintenance.

The manner in which it simultaneously performs the operations of drilling and spiking is shown by the accompanying illustrations.

In the photograph showing the under side of the motor there are plainly visible

the formerly expensive screw spikes can be used at a cost less than that of the old plain nail spikes.

In the photograph showing the work of inserting these screw spikes the spike driver is shown hung in the crane, thus relieving the operator of handling its weight. The round part just above the rail is a friction

In some sections of the country, particularly in the West, hard wood ties are difficult to get, and a new way of utilizing soft wood ties had to be found. The Au-Tra-Kar has made possible a method of changing soft wood ties into hard wood by the simple expedient of boring a large hole into the tie where the rail is to rest, and to fill this

hole with a hard wood plug. This hard wood plug then forms the basis into which the spikes are driven, or screwed. The boring of these large holes and inserting of the hard wood plugs easily is accomplished by the adjustable tools on the flexible shaft carried by the Au-Tra-Kar. The machine can be further used to operate the mechanical tamping bars which are finding favor

laborers to and fro, but when necessary it can pull two or even three push cars loaded to capacity with men or with ties, rails, bars, jacks, shovels, etc. The clutch is of the friction type, and can be disengaged completely, permitting the engine to be used by the track men as a source of power, while the car is standing still, and employing a small air compressor or electric gen-

its versatility is such that railway maintenance, so far as roadbed is concerned, is made much easier.

#### Preparing Polished Brass for Paint.

Unless proper measures are taken to clean the surface some little difficulty may be encountered when it is attempted to paint over any of the polished brass work with

"AU-TRA-KAR" USED AS A LOCOMOTIVE

RAIL-SPIKING OPERATIONS IN FULL BLAST

"AU-TRA-KAR" INVERTED, SHOWING POWER PLANT

for packing the ballast between the ties.

The gasoline motor employed is of the double-opposed type, air cooled, and develops 12 horsepower. It not merely saves the time and muscular energy required to propel the old type of hand car in carrying

erators it will operate riveting tools or other air or electric tools at a distance. It can be used also for spraying paint on bridges or to turn a concrete mixer, or with a mowing machine blade attached, it will cut grass and weeds from the right of way. In fact,

which so many of the older cars are adorned. The brass should first be scoured with a mixture of salt and vinegar to remove all grease, after which the surface should be washed with hot soapsuds and wiped dry with a clean rag. Thereafter it is likely that the paint may be applied without risk of its running while wet or chipping off after it has dried.

#### Better than Soapsuds for Carbon.

Someone has been advising the guileless novice to free his cylinders of carbon deposit by the simple expedient of injecting soapsuds into the automatic air valve of the carburettor by means of a squirt can. Although the advisor has nothing to say about the risk of rusting the bright rubbing surfaces through the action of the hot lye in the soap, it is probable that that risk will seem important as to prevent the wise motorist from undertaking the plan. Regular and consistent use of kerosene oil may be relied upon as both effective and harmless.

#### Winter's Wear on Steering Gear.

After the conventional siege of winter work, which is bound to include a certain amount of running over frozen roads and through snow, the steering mechanism of the car should be thoroughly overhauled. There is considerable likelihood that the wheels may be sprung out of line, while worn or sheared keys in the gear itself, or cracked or bent steering arms and connecting rods may have so "loosened up" the system that it is a positive menace to safety.

**LOUISVILLE LEADS SHOW QUARTET**

**Kentuckians Give Their Third Annual Exhibition—Fort Worth, Cedar Rapids and Paterson on the Circuit.**

With the opening of four more local automobile shows last week at Louisville, Ky., Fort Worth, Tex., Cedar Rapids, Ia., and Paterson, N. J., the 1910 show calendar is pretty well depleted, and there are few

more than 100 different models, being the largest exhibition ever staged in the Kentucky metropolis.

The list of exhibitors was as follows:  
Gasolene cars—Miles Auto Co., Packard; Banks Motor Car Co., Ford; Atlas Machine Co., Marmon, Regal, Empire and Grabowsky trucks; Straeffer-Arterburn Motor Car Co., Krit and Parry; John Mason Strauss, Chalmers; Prince Wells Co., Rambler; Yager Motor Car Co., Peerless; Marshall-Clark Motor Car Co., Maxwell; Olds Motor

Broc; Reimers Motor Car Co., Babcock. Steam cars—E. C. Walker & Co., White and Stanley.

Motorcycles—Robert O. Rubel, Jr., Curtiss.

Accessories—Auto Jack Distributing Co., Levy Bros., Louisville Automobile Co., Roy E. Warner Co., L. W. Thompson Co., C. W. Fisher, Andrew Cowan Co., Falls City Buggy Top Co.

After weeks of hard work and preparation

GENERAL VIEW OF THE BLUE GRASS SHOW IN STATE ARMORY, LOUISVILLE.

more exhibitions billed. With the exception of Louisville, the other cities entered the show circuit for the first time, but so successful were the initial functions that their repetition is assured.

First in size and importance was the Blue Grass exhibition which was ushered in by Mayor Head who, following a brief inaugural address pressed the time-honored button which set the lights aglow and also set a deep throated siren screeching its welcome. It was the third annual exhibition of the Louisville Automobile Dealers' Association, and was staged in the state armory, opening on Thursday, 17th, and continuing for the rest of the week.

Every available inch of the 72,000 square feet of space was utilized to display the wares of the 40 exhibitors, 30 of whom showed complete cars. There were more than 50 different makes of car displayed in

Works, Oldsmobile and Oakland; Hite D. Bowman, Stearns; Kentucky Auto Co., Cadillac; Hubert Levy Auto Co., Welch and Buick; Longest Bros. Co., Stoddard-Dayton and Overland; Reimers Motor Car Co., Haynes and Reo; Studebaker Auto Co., Studebaker; Thomas Automobile Co., Winton; Fulton, Conway & Co., E-M-F. and Flanders; Louisville Automobile Co., American Simplex; George Looms, Locomobile; Southern Auto Co., Ohio; United Auto Co., Premier and Kisselkar; Dunham Auto Co., Velie and Buffalo trucks; Glosbrenner Commercial Car Co., Rapid; Brown Auto Co., National; King's Garage, American; Kilgore & Stiltz, Frayer-Miller.

Electric vehicles—Hubert Levy Auto Co., Baker; Longest Bros. Co., Waverley; Miles Auto Co., Woods and Detroit; Studebaker Auto Co., Studebaker; Hite D. Bowman, Rauch & Lang; Southern Automobile Co.,

the Automobile Dealers Association of Cedar Rapids, Iowa, put on their first show in the Auditorium on Monday evening, 14th, and were fully repaid for their efforts by the quick and hearty response which the public paid. The attendance and the interest displayed were gratifying.

Ten firms exhibited cars to the number of 40, in about 25 different brands. There also was a good array of motorcycles and accessories. Among the exhibits was a home product exhibited at a show for the first time, the Beck truck, made by the Beck Carriage Co. of Cedar Rapids.

For the first attempt, the decorative scheme was quite effective. Above was a sky of hanging streamers and festoons of blue and white, while the walls and floor were concealed by green burlap, which in the former case was topped with white. Rows of white pillars interconnected with

streamers defined the aisles. Over all in the center of the hall hung a huge chandelier, 15 feet in diameter and containing over 500 lights, which was the piece de resistance in the illuminating scheme; rows of lamps strung about the exhibits and balcony also helped turn night time into daytime. The final curtain was run down on the 19th with very good prospects for a return engagement next year.

The exhibitors were the following:

Gasolene cars: Campbell Auto Co., Haynes, American, Stearns, Overland, Marion and Brush; George Yuill, Staver; Schreiber-Miller Auto Co., Empire, Moon, Everitt and Henry; Central Machine & Auto Co., Regal; C. E. Fawcett, Flanders, E-M-F. and Studebaker; Foy Supply Co., Reo and Rapid; Joseph Vavra, Rambler; B. & L. Auto Co., Hudson, Chalmers; Cedar Rapids Auto & Supply Co., White, Mitchell, Maxwell and Stoddard-Dayton; P. M. Lattner, De Tamble, Ford; Iowa Motor Car Co., Oakland, Buick; Beck Carriage Co., Beck; George Henderson, Cadillac.

Last week all roads and trails for miles around led to Fort Worth, Tex., which was in high fettle because of the several big attractions which were in session in the Panther City, among them its first automobile show, and not overlooking the cattlemen's convention and fat stock show. The latter were in the nature of old stories, however, and for that reason were overshadowed by the automobile affair, which was held in the big Coliseum, by the Fort Worth Automobile Dealers Association. With a few exceptions every dealer in the city and some from other points, took space, and over 60 different models were shown.

Through the holding of the show in connection with the live stock exhibition hundreds of people were drawn to the city who otherwise would not have made an extra trip to see the cars. Touring clubs came from many small towns and prizes were offered for the largest body of motorists, for those that came the farthest and for the greatest number driving the same make of car. Opening on Monday, 14th, the show lasted throughout the week. Following were the cars on exhibition:

Gasolene cars—Stevens-Duryea, Regal, Mitchell, Cole, Flanders, Oldsmobile, Hupmobile, Brush, Maxwell, Franklin, Ford, Richmond, Buick, Marion, Thomas, Halladay, Pierce-Arrow, Kisselkar, Empire, Chalmers, Hudson, Grabowsky, Rambler, Oakland, Marmon.

Electric vehicles—Detroit.

Steam cars—White.

Through the co-operation of makers and local dealers, Paterson, N. J., this week is having its first automobile show in the Auditorium and indications are that it will not be the last. Beginning with the opening on Monday night the attendance started strong and bids fair to continue so during the rest of the week, for many out-of-town people are in evidence.

Over 30 cars of 25 different factories, among them one foreign machine, are on the floor as well, as a good sprinkling of motorcycles and accessories. Indicative of the invasion of the automobile selling field by women is the presence of Mrs. Rickey, of East Orange, who sets forth the merits of Marmon cars.

The following cars are exhibited:

Gasolene cars—Reo, National, Pullman, Mercer, Studebaker, Overland, Marion, Franklin, Buick, Hudson, Oakland, Paterson, Jackson, Hupmobile, Empire, Monitor, Paige-Detroit, Cartecar, Goeth, Stoddard-Dayton, Lozier, Knox, Zust, Marmon, Winton, Parry, Schacht.

Electric vehicles—Studebaker.

#### New Idea in Shock Absorbers.

An entirely new idea in spring check construction is that which has been introduced in the new device which has just been brought out by the Ball Bearing Shock Ab-

sorber Co., of New York City, and which is descriptively known as the Ball Bearing shock absorber. Although closely resembling a popular class of shock absorbing devices in which excessive spring action is opposed by the frictional resistance set up between two scissors-like members which are attached to the frame and the axle, respectively, the arrangement, which is shown by the accompanying illustration, depends upon a totally different principle. Within the enclosure formed between the cup-like ends of the two main arms is a set of steel balls held in short circumferential channels which instead of being of uniform cross section, are tapered from semi-circular form at the center to nothing at either end. In consequence, any relative movement between the two arms tends to cause the balls to force the joined ends of the arms to separate as the balls run onto the shallow sections of their runways. Opposing this lateral separation of the arms are a pair of heavy rubber discs which act as compression springs and set up a very effective and elastic resistance which increases progressively as the movement of the arms proceeds. Such is the construction that excessive spring movements either in plunging or rebounding are checked, while the resistance is claimed to be so well graduated that it in no wise interferes with the natural resiliency of the springs themselves.

#### Increased Responsibility of Experts.

Frequently in cases where the driver of an automobile has been haled into court for fast or reckless driving, he has advanced the excuse that there was no danger for anybody, because his car was under such

control that he could stop it in a few feet by the extreme use of the brakes. Numerous recent accidents have proven that this is one of the worst fallacies that could ever enter the head of any driver, and the very latest one which happened in England sent the driver to prison for six months to meditate upon the effectiveness of brakes on snow or ice-covered roads.

A factory tester was trying out a car at good speed along the high road near Highgate, England, when a crossing sweeper stepped upon the road some 50 feet in advance of the automobile. The machine was a six-cylinder make and very powerful; the road had been wet with thaw during the day and had frozen over solidly during the evening, with the result that when the driver applied the brakes to the fullest extent, the steel studded tires on the driving wheels slipped over the frozen surface of the road like skates. The rear of the car spun around with full speed, struck the sweeper and killed him instantly. The force with which the machine "skidded" may be imagined from the fact that one wheel was broken clean off the hub, and the steel frame twisted into fantastic shape.

In sentencing the driver to prison, the judge laid particular emphasis on the fact that he was supposed to be an expert in his field, as he was adjudged competent by his employers to test their new cars on the roads; that under these conditions he should have been fully aware of the fact that ice-covered roads afford no secure hold to the wheels, and he should have known the consequences of severe braking on such roads in causing dangerous skidding, and that under these circumstances he should be considered criminally negligent and be sentenced to prison.

#### Why Spring Bolts Should be Tightened.

With the approach of the season in which so many new cars are put on the road in the hands of inexperienced drivers, it is well to repeat the admonition to tighten up the spring perch bolts after every two or three hundred miles of early running. It is a fact with which experienced drivers are perfectly familiar that a new spring exhibits a certain tendency to settle after being used for a time, which, in turn, tends to loosen the clamps which bind it to the axle. Unless the slackness is taken up as fast as it appears, there is risk of permanent damage to the springs through the working and twisting of the leaves, if not of actual disaster on the road as a result of breakage.

#### When Ruts are Likely to Do Damage.

In connection with the early spring excursions into the country, especial care should be taken to avoid any but moderate speed on badly rutted roads which are still frozen. To strike a deep rut when running at speed tends to cause a bad slew, if not to overturn the car; while in endeavoring to get out of frozen ruts, there is great liability of straining the steering gear.

**UTILITY RIG WITH PEDAL CONTROL**

**Overland Discloses a Delivery Model Having Characteristic Features—Details of Mechanism and Body.**

On the theory that one of the strongest demands in a commercial vehicle is simple and easily controlled speed regulating mechanism, there is much to recommend the new utility vehicle which the Willys-Overland Co. has just brought out. This first venture of the rapidly growing Toledo (O.) company is distinguished by the pedal arrangement which has been a characteristic feature of one of the Overland pleasure ve-

hicles in dimensions are  $3\frac{3}{4}$  by  $4\frac{1}{2}$  inches, and its nominal output 25 horsepower. Lubrication is by mechanical oiler with splash distribution in the crank pits. Ignition is by the conventional jump spark.

As the picture shows, the machine retains something of the clean lined, light and handy appearance of the pleasure car from which it is more or less directly derived, while at the same time affording ample body space for the needs of the man who requires a commodious but not bulky vehicle for light delivery purposes. Its rated carrying capacity is 800 pounds net useful load; a rack being provided in the body for such light commodities as cannot well be thrown loosely on the floor. Access to the interior is obtained either by tilting

NEW OVERLAND 25 HORSEPOWER DELIVERY CAR

hicles for the past two years, and which entirely dispenses with the change speed lever, leaving only the emergency brake to be hand controlled. As compared with the relative intricacy of the selective gear shifting device of the average pleasure or commercial car, this system leaves little to be desired where the vehicle is to be placed in the hands of an inexperienced and more or less unmechanical operator.

Another meritorious feature, also borrowed from Overland pleasure car practice, is the planetary change gear which is mounted on the semi-floating rear axle, after the fashion of the popular axle mounted selective gearset. It is the high speed clutch and low speed and reverse bands of this gear which are regulated by means of the two pedals on the foot board. One of the pedals has a rounded pad instead of the usual inclined plane surface, and when pushed forward engages the low speed band. The same pedal drawn back and pressed downward, engages the reverse. The high speed is controlled by means of a separate pedal.

The motor is of the four-cylinder vertical pattern, cooled by gravity circulation of a relatively small body of water. Its cyl-

inder dimensions are  $3\frac{3}{4}$  by  $4\frac{1}{2}$  inches, and its nominal output 25 horsepower. Lubrication is by mechanical oiler with splash distribution in the crank pits. Ignition is by the conventional jump spark.

**Hartford Dealers Elect Officers.**

The annual meeting of the Hartford (Conn.) Automobile Dealers Association was held last week and the following officers were re-elected for the ensuing year: Ralph D. Britton, president; L. H. Elmer, vice-president; S. A. Miner, secretary, and Fred W. Dart, treasurer. Plans for next year's show were discussed and the show committee, consisting of F. W. Dart, E. G. Biddle and W. L. Ledger, were instructed to submit suggestions at the next meeting.

**Harrisburg Has a Trade Association.**

The tradesmen of Harrisburg, Pa., have organized the Harrisburg Automobile Dealers Association and elected officers as follows: I. W. Dill, president; George G. McFarland, first vice-president; Andrew Redmond, second vice-president; E. W. Cox, secretary, and C. C. Crispen, treasurer. Arrangements are being made to hold a show during the week, April 11-16.

**DEFINES A "COMMERCIAL VEHICLE"**

**Attorney General of Connecticut Helps Secretary of State Out of a Difficulty—Effect on Fees.**

At first blush, the defining of a commercial vehicle would appear a comparatively simple task, but the second blush quickly causes doubts on that point and the greater the thought, the larger is the doubt that arises. Last week the Secretary of State of Connecticut, who is entrusted with the registration of motor vehicles, had the question thrust at him and it so filled him with doubt that he called in the Attorney-General of the State for a legal answer, which the Attorney-General promptly supplied at considerable length. His decision as to what distinguishes a commercial vehicle from others is couched in these terms:

"Webster defines 'commercial' 'of or pertaining to commerce; carrying on or occupied with commerce or trade, mercantile.' It is significant that this statute places the commercial vehicle in the same class with the motor truck, and I think it is obvious that with reference to them the legislature was designating vehicles used to transport merchandise rather than persons; a class of vehicles where the horsepower of the vehicle might determine the load to be carried but made little difference with the speed of the vehicle; a class of vehicles whose purpose and use is similar to our horse-drawn express and delivery wagon and trucks; a class of vehicles largely used upon the concrete and stone paved streets of our thickly populated municipalities rather than upon the 'improved' state roads of our country towns.

"Any make or size of motor vehicle, of whatever horsepower, which is exclusively used for the purpose of transporting merchandise, in my opinion comes within the term 'commercial motor vehicle' as used in this statute. The automobile which is used for the general purpose for which such vehicles are used, to wit: for carrying persons, if not owned or controlled by a liveryman, in my opinion is subject to the registration fee determined by the horsepower of the machine, and is not transferred to the commercial vehicle or motor truck class because its owner may occasionally carry home groceries or transport merchandise in it.

"In my opinion to be entitled to the special low registration fee designated for the commercial vehicle or motor truck, the commercial use made of the machine must continue during the period covered by the registration of the vehicle for the purpose, that is, its use cannot be lawfully changed to that made of the vehicle which must pay a registration fee based upon the horsepower, without paying the registration fee required for such vehicles."

**"INVADERS" TROUNCE "NATIVE SON"**

**Three Times They Show the Way to Livingston at Los Angeles—California Gets but One Crumb.**

In retaliation for the several trouncings which he received at the hands of Al Livingston, the native son, and his Corbin the previous week, Ray Harroun, the Hoosier crack, who has invaded the Pacific Coast to see what the local talent can do against his Marmon, turned the tables on Livingston in decisive fashion at the second two days session at Ascot Park, Los Angeles, on Saturday and Sunday, 12th and 13th, respectively. Of the four offerings on the bill, at 5, 20, 50 and 100 miles, respectively, the Indianapolis combination captured all but the first, but not without stiff opposition on the part of Livingston, who put up a game fight until retired through an accident to his machine.

Not only did Harroun and his yellow flier annex the major share of the honors, but they also wrested from the Angeleno lad the 50 miles coast record which he had established the previous week, and furthermore fractured the coast century mark which had stood on the books for three years. It was a comparatively small field that furnished the thrills for the two days, not over half a dozen cars competing, but between the dusty track and the rivalry among the contestants, the going was of the lively order throughout.

**First Day—Saturday.**

Although Livingston, his most dangerous opponent, was on the line against him for the half century, Harroun practically had it won before he started, for the Corbin was in anything but fit shape for the gruelling grind, as its driver well knew, but his grit inspired him to take a chance. In the previous event the Corbin had cracked a hub and Livingston, as he came to the line for the 50 miles, was warned by the referee not to start, but he insisted. Getting away good Livingston took the pole, but hardly had passed the three-quarters stake when the overworked hub went to pieces and the Corbin was retired.

From then on it was Harroun's race, his only adversary being Harold Stone, in a smaller Marmon, but Stone never proved dangerous, being in the race more to worry Livingston than for any other reason. Although compelled to change a tire Harroun glided along to such good advantage that he lopped 10 seconds off the mark made by Livingston a week before and set new coast figures at 50:16 $\frac{3}{4}$ .

The 20 miles event fairly sent the spectators into ecstasies so hotly was it fought. Harroun, Livingston, Frank Siefert with a Palmer-Singer, and Morris O'Donnell, Pennsylvania, were the four which furnished

the fireworks. Siefert started to make a runaway and gave Harroun his dust for five circuits when his engine ran dry of oil and burned out its bearings. Thereupon Harroun went to the front and stayed there to the finish, although Livingston made a desperate effort to nail him at the tape, but fell short. O'Donnell was far in the rear. Harroun was clocked in 19:40, having averaged better than a mile a minute and set new coast figures for the distance.

Livingston's only victory of the meet was the five miles curtain raiser in which he trimmed Harroun in good style registering the five circuits in 4:57 $\frac{3}{4}$ .

The summaries:

Five miles, stock cars—Won by Al Livingston, Corbin; second, Ray Harroun, Marmon; third, Frank Siefert, Palmer-Singer. Time, 4:57 $\frac{3}{4}$ .

Twenty miles, stock cars—Won by Ray Harroun, Marmon; second, Al Livingston, Corbin. Siefert did not finish. Time, 19:40.

Fifty miles, stock cars—Won by Ray Harroun, Marmon; second, Harold Stone, Marmon. Livingston did not finish. Time, 50:16 $\frac{3}{4}$ .

**Second Day—Sunday.**

With a patched up car liable to tear asunder at any time, Livingston came to the line on the second day eager for the fray. Against him were pitted the pair of Marmons with Harroun and Stone in the drivers' seats, and Endecott in a Cole. While even his friends could not see where he had a chance, Livingston still retained his characteristic hallmark of courage and sent the car away in the lead. For the first five miles he and Harroun exchanged the leadership in a series of hot spurts and then the latter allowed Livingston to set the pace, satisfied to trail him and wait for something to happen. For 62 miles this chase went on, when the Corbin was pulled up for tire changes. Much time was lost by this delay as the new wheels were not fitted with demountable rims, and, together with engine trouble, which arose during the stop, Livingston was ten miles to the bad when he got going again. With renewed effort the Corbin was sent ahead to make up its lost ground and so hot was the going that the two cars brushed tires in the 83d circuit, but fortunately they separated before an accident was born. About this time Endecott was eliminated with a broken oil pipe. Circling the oval with great precision, Harroun rounded out the century in 1:43:14 $\frac{3}{4}$ . Stone rung in second and Livingston was third. However, Livingston got the largest share of lap money, a dollar being offered for the leader at each mile, and he took just 61 of the silver discs, the other 39 going into Hoosier coffers.

The summary:

One hundred miles, stock cars—Won by Ray Harroun, Marmon; second, Harold Stone, Marmon; third, Al Livingston, Corbin. Time, 1:43:14 $\frac{3}{4}$ .

**MORE POCKET-PICKING IN PROSPECT**

**New Jersey Senate Prepares to Raise Registration Rates All Around—Seeks to Divert Money, Too.**

Having defeated the Edge bill, which would have permitted motorists registered in other states to enter New Jersey without paying an "admission fee," the Senate, under the presidency of Joseph S. Frelinghuysen, proceeded to lay plans for picking the pockets of the natives of more "easy money." The plans took the form of two bills introduced by Senator Brown, of Monmouth county, member of the Monmouth Automobile Club, and the Associated Automobile Clubs of New Jersey. His first bill proposes to boost the registration fees all along the line and also to abolish the present system of permitting non-residents to use the roads of New Jersey for eight days upon the payment of the fee of \$1; he would compel them to pay the full fee of \$25 for a 40 horsepower car, even for one day's use of the roads of the Mosquito State. This latter part of the bill is contained in a little "joker" in the form of the regular repealing clause providing for the repeal of all prior bills consistent therewith.

Mr. Brown's bill authorizes the following registration fees for automobiles:

First class—less than 10 h.p.	\$3.00
Second class—from 10 to 15 h.p.	5.00
Third class—from 16 to 20 h.p.	10.00
Fourth class—from 21 to 24 h.p.	15.00
Fifth class—from 25 to 39 h.p.	20.00
Sixth class—40 h.p. and over	25.00

The present rates are \$3, \$5 and \$10.

The second bill introduced by the Monmouth senator would further Governor Fort's much discussed pet project of an ocean boulevard along the Jersey coast from Atlantic Highlands to Cape May. It would require the state of New Jersey to pay one-half of the cost of the boulevard instead of the quarter which the state now pays for the construction of new roads, and permit the funds in the State Treasury accrued from the registration of automobiles to be applied to the maintenance of the boulevard, instead of dividing such funds pro rata among the counties.

Needless to say, both bills are vigorously opposed by the automobilists of New Jersey, and resolutions have been passed by the Associated Automobile Clubs of New Jersey, the Automobile Club of Hudson County, and the North Jersey Automobile Club, denouncing both measures and protesting against their enactment.

In discussing the two bills introduced by Senator Brown, Senator Wilson calls attention to the report of the State Motor Vehicle Commissioner which showed that during 1909 but \$7,300 was received from the \$1 a year non-resident tourist rate, while during the same period over \$240,000 was collected from the "natives."

## GERMANY'S TRUCK SPECIFICATIONS

**Government and Manufacturers Revise the Regulations—The Vehicles that Now Will Earn Subsidies.**

Utilizing the experiences of the past two years, the German War Department and the manufacturers of commercial motor vehicles at a meeting held during the first week of February in Berlin, decided upon a revision of the rules under which the government would pay subsidies to automobile manufacturers. Many of the general regulations and specifications have proven satisfactory and have not been changed, but

not require more than one-sixth of a gallon per kilometer on dry, level roads.

All trucks must be provided with both battery and magneto ignition.

Transmission must be of the sliding selective type.

The maximum of speed must be 16 kilometers per hour, and the trucks must be capable of going at a  $3\frac{1}{2}$  kilometer speed on the reverse.

Drive may be either by chain or shaft.

Brakes must be expanding band brakes on rear wheels.

The exhaust pipe must be furnished with a muffler, and shall be bent slightly upward, in order to reduce dust.

All pedals for clutch, brakes and accelerator must bear clear inscriptions.

## PRIVATE CAR AND ITS FEATURES

**Only One has been Built and It Departs from Usual Practice in Both Frame and Engine.**

Although it is several years since the use of wire wheels has been at all familiar in this country, the advantages of that type of running gear have continued to appeal to a certain class of English manufacturers, with the result that they have been in continual service abroad on several makes of car. It is not unlikely, however, judging from a number of indications, that an increase of their use in the United States will occur be-

NOVEL DESIGN OF WIRE WHEELED PRIVATE CAR

SPARE WHEEL CARRIED ON REAR.

some very important changes have been adopted in the requirements of the motors, power of surmounting obstacles, coupling, and the complete standardization of easily detachable parts, so that a full interchange of parts may be effected between vehicles of different makes. The horsepower minimum has been reduced from 35 to 30, and the height of the bonnet from 50 cm. to 45 cm $\frac{1}{2}$ . The tread also has been slightly reduced, from 70.8 inches to 67 inches, while the grade which a loaded truck, pulling a loaded trailer must be able to surmount, has been fixed at 1:8 in place of the former 1:7.

The total weight of the car shall be as close to 15,000 pounds as possible.

The motor truck, with its trailer, must at all times be capable of surmounting inclines of 1:8, when fully loaded.

The tread must not exceed 67 inches, nor the wheel base be longer than would permit the truck to be driven around any existing curve on any public road.

A reliable signaling device must be provided between the driver on the motor truck and the brakeman on the trailer, and a dust-shield must be provided for the brakeman.

Driving wheels must be provided with easily accessible sandboxes.

The trailer shall be similar in construction and build to the motor truck; both together shall form a homogenous whole.

They must be economical in gasoline and

The coupling between truck and trailer must be arranged so as to permit of a free space of at least 12 inches, even in the sharpest curves.

The front wheels of the trailer must be capable of being turned in 360 degrees, a complete circle.

Each truck must be provided with three complete sets of anti-skid devices, preferably short cross chains.

Complete and uniform dimensions are provided for all detachable parts, such as wheels, tires, rims, spokes, hubs, etc., so that interchangeability is possible between different vehicles.

### Forty Years of Columbus Buggies.

To those who are inclined to regard the motor vehicle as yet in its infancy, a statement in the newly issued catalog of the Columbus Buggy Co., may assume the proportions of a mild shock. The statement is to the effect that the company's products have been on the market for over forty years. Of course the explanation is that Columbus buggies were built to please lovers of the horse long before the motor vehicle came on the scene. A perusal of the neatly embellished catalog, however, furnished convincing proof that the wisdom of the old-time carriage maker has not been misapplied in the production of electric automobiles.

fore long. On this account, particular interest attaches to a new car which has been constructed at the Springfield (Mass.) shops of the Hendee Mfg. Co., as a private venture. The car, which is of torpedo racing runabout form, is wire wheel equipped, and otherwise exhibits a number of striking and commendable characteristics.

The vehicle, a general idea of which may be obtained from the accompanying illustrations, was designed by James H. Jones, formerly designer for the Knox Automobile Co., and is said to be the lightest of its class yet produced. The chassis complete weighs but 1,600 pounds, notwithstanding the fact that owing to the detachable feature of the gear an extra wheel is carried as a part of the regular equipment. The wheels, it should be mentioned, are of the same general form as the English Rudge-Whitworth, but modified to suit the machine. The complete equipment of five wheels weighs less than the ordinary artillery equipment would weigh without an extra wheel. Such is the method of attachment that a replacement can be made without difficulty in less than 30 seconds.

The motor reveals a construction which is a little unusual in this country, though favorably known; its six cylinders being cast in blocks of three. The cylinder heads are detachable and contain the inlet passages, integrally cast. The valves are of the over-

head type, actuated by push rods and rocker beams, but are introduced into the cylinders without the use of separable cages. An-

As the illustrations plainly show, the body is of entirely original lines, with rotund back and high sides. The dash is brought

completely houses the driver and passenger. The gear shift and brake levers are placed outside the body; the remainder of the con-

CLUTCH AND CHANGE GEAR ARRANGEMENT

other distinguishing mark is that the cylinders are cast with large openings cored out at the sides, which are closed by aluminum cover plates. All moving parts have been designed with an eye to weight reduction and the preservation of the balance wherever possible, thus developing high efficiency together with low weight. Lubrication is accomplished by the popular and modern force feed system, with an oil reservoir integrally formed in the base of the crank case, and feeds conducted under pressure to the crank shaft and connecting rod bearings.

Both engine and change gear are carried on a substantial sub-frame, the gear box and plate clutch being so arranged that they may be dismantled without disturbing the body. The gerset is of the three-speed selective order, and final drive is through a double jointed propeller shaft to the semi-floating rear axle. The latter is neatly and compactly housed and is so contrived that the active parts—the differential and bevel driving mechanism may be withdrawn without disturbing the axle. The torsional stresses are resisted by a triangular member, which is hinged to the differential housing in such a way as to prevent it from being strained in preserving the alignment of the axle.

The front axle is of pressed steel, with a 4-inch drop. This provision, together with the 4-inch upsweep of the frame in the rear makes it possible for the body to be hung fully 4 inches lower than on most cars of corresponding dimensions, yet without exceeding a rational allowance for clearance.

RIGHT SIDE OF SPECIAL MOTOR

LEFT SIDE, SHOWING FREE EXHAUSTS

well back, and surmounted by a high protecting screen which with its side pieces

TORSION AND AXLE EQUIPMENT

trolling mechanism is of normal pattern. The gasoline tank is located in the rear of the torpedo, where also is provided ample carrying space for such spare parts and supplies as may be needed. It may be added that the car already is in service and has given a good account of itself under the trying road conditions of late winter and early spring.

#### Pierce-Arrow Operatives Lunch to Music.

Certainly the only employees of a motor car factory, and possibly the only ones in any kind of an American manufacturing establishment, who have music during their noon lunches are those of the Pierce-Arrow Motor Car Co., at Buffalo. Recently the men, backed by the officers and department heads, organized the Pierce-Arrow Amusement Association. This organization stands behind the baseball team bearing the name of the car, all the players being employees, and also plans to have entertainments for the men and their families at regular intervals. For that purpose the immense dining hall at the Pierce-Arrow plant will be used. In this hall 800 men are served with lunch at noon and a short time ago decided to have music with their meals. Accordingly a grand piano was bought and a man to play it engaged. Now when the 800 men are at their tables between 12 and 12.30, they are regaled with classical and popular music. It is probable that before long plans will be adopted to furnish much more pretentious programs for the entertainment of the men during the noon hour. Needless to add, any scheme for promoting "harmony" among the employees has the approval of the company.

## SCOPE FOR ENGINEERING TALENT

Tracing Growth of Industry, Cuntz Points Out Departments in Which Opportunity for Study Exists.

Nearly everyone connected with the automobile industry realizes that it presents a grand and lofty opportunity for the trained engineer to distinguish himself; that its numerous and varied problems offer him the necessary basis for a notable career. But it is an unfortunate circumstance that until within a year or so the engineering profession as a whole has been largely unaware of the fact. In general, however, it is only necessary to indicate the conditions surrounding a problem to an engineer in order to enlist his sympathy and interest in it. It was with that intent that Hermann F. Cuntz, of the Licensed Association of Automobile Manufacturers, reviewed the present strength and the needs of the automobile manufacturers as a class on the occasion of his recent lecture to the Stevens Engineering Society, at Hoboken, N. J.

In addition to relating some little known phases of automobile history, Mr. Cuntz also dealt with the rapid rise of the industry, and indicating the probable expansion which the future has in store for it, he added some figures which are of timely interest particularly in view of recently published statements of a similar nature which, in the light of the present and all other authority, were grossly exaggerated. Probably there were 300,000 or more cars in use in the United States last year, Cuntz asserted, whereas ten years ago there were not more than 300—in fact, in 1898 just 288 machines were built, he stated.

"That was eleven years ago," he added. "In 1909 the output was about 185,000 automobiles, representing \$200,000,000 in selling value. For this immediate year I estimate that about 175,000 new automobiles will be sold in the United States and manufactured in the United States, in addition to which there will be two or three thousand foreign made automobiles imported. The total manufacture in the United States represents \$325,000,000 worth of automobiles. In England there were in use last year 183,000 automobiles. We brought to the United States and have in use practically 310,000 automobiles, far in excess of those in use in England, although England's active development began in 1896. . . .

"A few years ago the average price was over \$2,000 per automobile; this year it was about \$1,700—a considerable reduction. This current year there is every promise that that the average price per car will be about \$1,600; and that is due to economies in production largely the result of expert mechanical engineering. . . . We have about 310,000 automobiles in commission in the United States—that is, allowing

for depreciation, the scrapping of a large number, destruction by fire and everything else. That would afford—and high power represents the aggregate—between seven and eight million horsepower. . . . If the present condition is to continue—that is, the increase in production of automobiles—we may easily expect to find 100,000,000 horsepower available in these small units in the next ten years. That would represent at the same time about twenty-five or thirty million tons of automobiles."

Regarded as an engineering achievement, the development of the automobile as a machine has been quite as remarkable as its development as an article of merchandise. "Consider for a moment that the locomotive designs were started in about 1800 or 1804, and in one century the steam locomotive has been developed to the state you now see it," says Mr. Cuntz. "The automobile, however, has developed in ten years more than the locomotive has developed in a hundred years." Perhaps the most marvelous feature of that development has been the evolutionizing of the internal combustion motor from the types weighing 400 pounds or more per horsepower to the present construction in which the weight per power unit may be made as low as ten pounds per horsepower without serious inconvenience, and, for aeronautical purposes, frequently is reduced to a much lower figure than that. But the real burden of automobile improvement has come in substituting the thoroughly designed chassis for the running gear of the horse-drawn carriage.

"In fact, up to 1898 and 1897 the vehicles designed were much like horse drawn vehicles," says Mr. Cuntz, "and the idea of getting the center of gravity lower and lower was simply a matter of experimental requirement. I remember when there was a week's conference on and off, between the heads of several commercial manufacturing enterprises concerning a certain model that they had finished, to determine whether they should lower the center of gravity three inches or not. They finally decided that they would give in to the engineer and it was lowered, and as lowered that machine of eleven years ago was probably six inches higher than the present day automobile. So you see it was a gradual development from the old suggestions and designs to the present automobile that you consider the real article.

"As to the question of power development: With increased power, greater speed, taking short turns on American roads, the center of gravity had to be lowered. Lowering the center of gravity helped the situation somewhat but the gauge had to be increased from that used on the early automobiles. They found with increased engines the total weight of the parts increased, and they had to increase the tires. And so it went as a matter of gradual development; experiment and experience dictating as to what changes ought to be made. Today

the center of gravity question, the question of centrifugal force, is one problem for any engineer after graduating, and that he may well take up. There is a field for specializing in becoming an expert on construction of tracks for automobile racing, and that leads him to be consulted as an expert on the banking of common roads. There is the question of centrifugal force in all its original difficulties—for large and small cars. . . .

"The question of the gyroscopical effect of the parts of the automobile has been the subject of considerable discussion and unfortunately I think a great many people are wasting their time on it. The speed of the fly wheel as now used, corresponds to the speed of the engine and the speed of the engine is now less than it was six years ago. But another element enters in, that is using the gyroscope for instance to prevent sluing and side slipping, and that is a fruitful field of investigation and is to be investigated. . . .

"From an historical standpoint the fuel had a great deal more to do with the development of the internal combustion engine suitable for automobile propulsion than is ever imagined. The development of the petroleum industry in the 50's brought about the supply and it was finally used in the internal combustion engines. The previous combustion engine for about 90 years was run by gas from different sources of production. The practical automobile now obtains a very compact fuel in liquid form, because you can very easily carry enough gasoline to drive an automobile 100 miles. But if you were to take a sufficient quantity of gas to do the same work and hold it under a pressure of 100 pounds it would result in the necessity of carrying a tank about as large as a large sized delivery wagon, which, of course, would be a wholly impracticable proposition. So really the compact fuel was essential for the development of the automobile. . . . The number of cars in use shows you what a large supply of fuel is required for automobiles today. Consider 300,000 cars averaging 1,000 miles per year which would equal 300,000,000 car miles, and at ten miles per gallon that would require 30,000,000 gallons of fuel. That represents a pretty large sum and that is a pretty conservative figure.

"When you consider that some vehicles are run with one gallon of gasoline seven miles and others make 34 miles, and others make 48 miles, you wonder why. Reduce it down to miles per gallon of gasoline, and some of the tests we ran a year ago showed the best to be 52 and a fraction, and then another test was 54 miles per gallon of gasoline. . . . One went 20 or 30 per cent. in one case better than another. Now there was a loss somewhere, from the gasoline, the engine, transmission and the rear axle construction—there were losses all along the line. If you could take the power in the gasoline and apply it directly at the rim of the wheel of course it would be a

different proposition. You can't do that so it is the mechanical engineer's problem to save wherever he can.

"If you could save by proper carburation and proper automatic control of your carburetter and proper control of your engine say 5 per cent. of the fuel, and if you could introduce that throughout the United States in all cars being used, in that one item you could save a million and a half gallons per year of fuel. You can see that in the small case of taxicab operators, where they have a thousand cars in operation, that is quite an item. . . .

"But there is another field for the mechanical engineers, and that is in improving the efficiency by getting complete combustion, and to do that various schemes have been devised. Various compounds have been suggested to add to the gasoline and that is a very interesting chemical proposition which anyone would be fully warranted in making a special study of and possibly the subject of a special thesis to find out what the effect is in the way of increased power. One of the problems is to produce such complete combustion as absolutely to eliminate any smell and that is of great importance where there is congested traffic and the exhaust is very noxious. . . .

"The carburetter of today can be made the subject of a special study by an engineer and for the reason that it is one of the parts that has received more study by the ingenious mechanic and the man who knows nothing about mechanics than any other one part of the automobile, and as a result many of the carburetters that have been developed in the last ten years by such individuals have been very successful in minimizing the efficiency of the mechanism, but if you leave out the alleged inventions of these individuals you get a better carburetter than if you used it. There is a case where if you get the right sized openings, and the right shape of your pipe, and the right relative size of the oil orifices, you can make the whole device of one casting, one pipe and one valve, and get a better result if all are well proportioned than if you have 50 different parts in your mechanism.

"The engineer has got to see what the principle is that gives the results, and then the rest is knowledge how to construct it. . . . What the real engineer must always endeavor to provide is the minimum number of parts and economy of production.

"Another tremendous factor in the development of the automobile has been the development in steel, not alone in the line of automobile manufacturing, but in every line of manufacturing. But in automobile manufacture the development has been remarkable because the automobile manufacturer was willing to pay to get his lighter construction, and having developed that steel and having developed the means for heat treating it, it became available for all sorts of purposes and as a result, better steel today is going into all sorts of construction,

typewriters, adding machines, railroad cars and everything else. But this is largely in view of the development and impulse given to improved steel construction by automobile and bicycle manufacturers. . . .

"In speaking of gears, that is what we might call a side issue from one standpoint. The designing and manufacture of an automobile is one thing; to build the machinery to produce it is one of the greatest problems that confronts the manufacturer today. The manufacturer today is ordering his material for production of 1912 automobiles at the present time and the man who is to produce what the manufacturer wants is ordering his machines to produce that material and expects it to be delivered in six to ten months. Not only has that machinery got to turn out the goods, but it has got to turn them out cheaper and more efficiently and more satisfactorily. So any machinery for turning out special parts of automobiles includes gears. . . .

"Passing from the engine to the transmission of power to the rear wheels, ten years ago they were using belts and pulleys. They were using pulleys on friction discs; they were using chains in many complicated ways. At that time the field was practically evenly divided between belts and chains, and discs and pulleys and spur gears, but they did not think it was mechanically a possibility to slide the gears for every change in and out of engagement. But it is marvelous to see how this at first unmechanical sliding gear—and it is very unmechanical in many ways—has now become the universal use. It is hard to say why it should be the accepted usage, but it is in use and made practicable, not on the standards of old practice, but by developing the material and designs in every minute detail so that it would and does work satisfactorily."

#### A. A. A. President's Orful Offense.

Louis R. Speare, president of the American Automobile Association, has felt the heavy hand of the law. On Saturday last, in Brighton, which is a part of Boston, which is in Massachusetts, he committed a heinous offense and was promptly gathered in by a lynx-eyed, open-eared guardian of the peace. Speare's dreadful crime consisted of failure to disturb this peace, in that he did not blow his horn when passing the intersection of a public thoroughfare and a private way.

#### Where Lamp Theft is Epidemic.

According to newspaper estimates, which are notoriously exaggerated, nearly 1,000 lamps have been stolen from automobiles in the city of Chicago within the last few months, and automobile owners are saying uncomplimentary things about police protection in general and Chicago "non"-protection in particular. The police department does not deny that such a traffic is going on, or that hundreds of lamps are stolen every month, but they claim not to be in a

position to station a policeman in front of every automobile which happens to draw up to the curb, while the owner stops to transact some business, or to partake of dinner. As the lamps cost quite a pretty penny, the loss suffered by the automobile owners is considerable.

#### Woman Sues for Mud-splashed Gown.

Considerable interest attaches to the report from London, England, that an automobile owner has been sued for damages which were done to a lady's expensive dress by the mud splashed upon it by the wheels of his passing car. Though the case as yet has not been decided, interest is at a fever heat in English automobile circles, as probably every owner of an automobile will be forced through self-protection, to equip his car with some kind of mud guards, such as are used on Paris public motor cars. The latter are half-moon discs of leather, suspended freely from the axle, and extending from the point where the tire touches the road to that where it leaves it. No other form of mudguard is of any use for this particular purpose, as the mischief to passing pedestrians is done when the wheel forces its way through the wet slush. Even slow and careful driving will cause a splattering of dirty water to a distance of five or six feet from the wheels, while fast travel scatters it a distance of more than ten feet.

#### Owner Responsible Even if Absent.

That the owner of a motor car is responsible for any damage it may cause, even if he is not occupying it, and no matter who is riding in it or driving it, was decided by a jury in the New York Supreme Court last week. The verdict was rendered in the case of Benjamin Freiborn, a youth 17 years old, who was run over and seriously injured by an automobile belonging to James C. Brady, a New York broker, and who sued the latter for damages. The car was driven by a chauffeur in the employ of the New York Transportation Co., who had been furnished for that occasion, and Michael F. Brady, a brother of the owner, was occupying the car at the time. The jury awarded Freiborn \$5,000.

#### Law Lays Heavy Hand on Chauffeurs.

During the past week no less than three chauffeurs in New York City were found guilty of manslaughter and were sentenced two to terms of six months, and the other to three months imprisonment. In each instance they ran into and killed a man, and while the court was merciful, the judges stated that recklessness must be punished. Two other drivers who pleaded guilty to third offenses against the speed law were fined \$100 each and sentenced to three days and one day in jail respectively. Still another, a fourth offender, was released under suspended sentence on condition that he leave the state within 48 hours. He promised to go to Cleveland, Ohio, immediately on his release.

## ACCELERATING THE IGNITION

### Phillips's Method of Obtaining More Rapid Combustion—Its Operation and Advantages Claimed for It.

Despite the high relative degree of success which has been obtained with ignition appliances up to this time, it is a generally accepted fact that the rate of inflammation of the charge in some instances is not as rapid as is desirable. To obviate this shortcoming various projects have been suggested, none of them, perhaps, more ancient or more promising than that of multiple ignition. A recent revival of this scheme in England, in connection with the Phillips system has brought forth considerable discussion and incidentally has served to secure not a little publicity for the invention itself, which is not without novel and ingenious features.

In a word, the plan of the inventor, Robert E. Phillips, is that of introducing into the combustion chamber from various points symmetrically arranged with respect to its contour a series of ignition flames synchronously discharged and themselves energized by the conventional electric spark. In this respect, it may be added, the system differs materially from others which have preceded it, and in which it was attempted to attain the desired result by the use of two or more spark plugs, or a single plug having two or more spark gaps. In the Phillips system only one plug is employed; but instead of being placed directly in the cylinder, it is pocketed, while a series of fine ducts lead from the pocket to various points in the combustion chamber, from which the ignition flames are discharged.

In the last analysis, close readers of gas engine history will trace in this a faint resemblance to the method employed in the early Otto slide valve engines, wherein ignition was accomplished by the expedient of causing a small body of compressed gas contained in a pocket in the valve, to be expanded into the main body of the charge at the instant when the pocket in the slide valve registered with the cylinder port in front of the valve. With the higher compression of present practice, however, as well as the different method of application, it is evident that the actual results obtained should be far more successful than those secured with the Otto engines.

In the first of the two accompanying illustrations is shown a method by which the Phillips system is readily applicable to any engine of the type in which the ordinary spark plug is mounted in the center of the cylinder head. The section shows the cylinder to be of T-head form and of regular construction save in respect to the ignition arrangements. Instead of jutting directly into the combustion chamber, however, as is commonly the case, the spark plug is car-

ried in a recess far enough above the top of the combustion chamber to permit of its being masked by a plug which completes the enclosure of the sparking points, save for a series of small bore ducts which are led out at an incline and radiating from the pocket.

The principle of the thing is this: During the compression stroke a small body of the charge is forced into the ignition pocket and raised to the same pressure as the remainder of the charge, and at the very in-

CYLINDER ARRANGED FOR MULTI-SPARK IGNITION

stant of sparking, it is ignited, its restricted volume causing it to expand through the firing ports, from which it is shot directly into the main body of the charge in the form of little tongues of flame, but at points sufficiently separated to insure the ignition of the main body of gas at several different points. Theoretically the rapidity of the ensuing combustion is governed by the number of the flames and the area over which they take effect. Needless to say, it is essential to the success of the system that the ports should be of exactly the same length and that they should be free from sharp bends and have smooth walls.

An alternative arrangement is that shown in the second illustration, in which but two flame ports are employed, which are cored out of the cylinder casting itself, and enter

ALTERNATIVE ARRANGEMENT WITH TWO FLAME JETS

the combustion chamber at diametrically opposite points. Obviously this arrangement is one which must be taken into account in the original design of the engine.

To the several obvious objections to the system, its inventor is ready with answers which he claims are founded on experimental results; though unfortunately no test data has been published as yet. The apparent difficulty of scavenging the ports together with the probable lag in the firing of the charges, which would be expected to

result, he claims are non-apparent in practice. It has been found that with four holes of 3-32 inch diameter the firing was perfectly regular at all engine speeds, while as compared with results obtained with a single port of 5-16 inch diameter no differences were observed.

The inventor's claims for the system are three in number. By the use of the multi-point ignition more rapid combustion is expected to develop. From this gains of from 10 to 30 per cent. of power are anticipated at high engine speeds, while it also is expected that improved ignition of weak mixtures at low speeds will result.

### Youthful Whiskers that Deceived Dealer.

How careful automobile dealers have to be in Germany, if they desire to keep out of difficulties, is aptly illustrated in a peculiar law suit pending in Frankfort-on-the-Main. The defendant is a dealer in automobiles, who is accused of selling a motor car to a minor for the sum of 2,500 marks. Testimony taken in court showed that one day in January last, there came to his store a young man, wearing imperial and mustaches, apparently 25 years of age, who bought a small runabout, paying cash for it, and drove away in it. Four weeks later the dealer was sued by the parents of the young man, who is said to be only 20 years old, the latter claiming that the sale was unlawful in that the purchaser was a minor, and demanding a return of the purchase price. As is but natural, the dealer refused to hand over the money, for his car had been lost in the shuffle, having been sold and resold several times. The German laws are very strict and explicit in connection with the sale of automobiles to minors, and legally the dealer is guilty without doubt. In view of the mature appearance of the buyer, however, a hard fight is being put up by the lawyers for the defendant, and the outcome of this unique law suit is being watched by every dealer in the Fatherland.

### White Vans Work Well in England.

That the White commercial vehicles are giving a good account of themselves abroad, is shown by a report of Messrs A. W. Gamage, Ltd., London. This concern, which is one of the largest sports outfitters in the world, bought last spring seven White steam delivery vans, and admit having had "a most satisfactory experience during the recent Christmas season." One of these vans ran during the time from May 25, 1909, to March 3, 1910, 12,081 miles. Pneumatic tires are used, one of which gave good service for 10,395 miles, and two others 7,393 and 7,007 miles, respectively. They averaged between 14 and 15 miles on a gallon of kerosene, in spite of the frequent starting and stopping necessitated by the city delivery service. Every month the vans were sent to the shop for one day to be looked over, and every six months taken out of service for one week to undergo a thorough overhauling.

## AGAINST FREAK SPEEDOMETERS

**Swiss Government Rejects Proposal to Make Their Use Compulsory—Objections that Decided the Question.**

The much mooted question whether or not it would be of advantage to the general public and to the police to compel motorists to equip their cars with speed indicators visible to persons on the street, has been decided, at least so far as Switzerland is concerned, the proposal submitted to the Federal government of that country to make the carrying of such devices obligatory on all automobile owners having been turned down by the committee charged with the investigations concerning their usefulness.

The committee reports that out of 21 instruments submitted, 14 were selected for trial, of which, however, only 11 actually were put to test. The committee in its report deals with the instruments in their various groups and expresses the opinion that:

Tachometers and the like without registering contrivances are of no value to the police or to persons outside the vehicle, as the registrations would be practically unreadable at the speed at which the automobiles are usually driven.

Registering tachometers record the speed correctly enough, but their price is too high for them to be rendered obligatory without causing an injustice to motorists; were the carrying of tachographs made obligatory on Swiss roads upon foreign motorists, the Swiss frontiers would be closed and Switzerland debarred from participating in an international regulation of the motor traffic.

Tachometers with optical signals (colored discs appearing according to speed) besides blocking the view of the road would necessitate the use of constantly oscillating parts and would be useless to persons afflicted with daltonism (color blindness).

Speed indicators with acoustic signals are out of the question, for while they may give a sufficiently audible sound at the maximum speed decided upon, they would be inaudible just at the time when most needed, i. e., when passing through villages.

On these grounds the committee decided that it could not recommend the obligatory adoption of any speed indicator, recorder or limiting device and strongly advised the cantonal authorities against following such a course.

### Telephones Location of Loose Parts.

For locating loose parts about the engine or other moving parts of the motor car the value of the "sounding rod" long has been known. For many reasons which are obvious, however, a device having a vibrating diaphragm is more efficient as well as more

convenient to handle than the plain wooden or wire rod, which must be held between the teeth while the ears are closed with the finger tips, in order to be of any use at all. Such a device has just been perfected by the Gaylor Automatic Stropper Co., of Stamford, Conn., and is about to be placed on the market under the name "Sonoscope." As the picture shows, it consists merely of an extensible vibrator rod which is jointed

SONOSCOPE VIBRATION TESTER

together in sections, so that it may be adjusted to any length required, and a sounder or ear piece, in which is a sensitive diaphragm much like that of an ordinary telephone receiver. In use, the end of the rod is pressed lightly against the outer part of the mechanism which it is desired to test for lost motion, the vibrations in the metal being transmitted through the rod to the diaphragm. So perfectly is the sound transmitted and magnified, that it is claimed that the sound of the balls traveling around in an ordinary ball bearing may be heard all over a room. Of course, for remote or delicate determinations it is necessary to place the receiver against the ear, but ordinarily it is said, this procedure should not be required.

"The A B C of Electricity." Price, 50c. The Motor World Publishing Co., 154 Nassau street, New York City.

## TERMS THAT APPLY TO TIRES

**Braden Defines Some of the Popular Additions to the Terminology—Also Indicates Causes and Effects.**

Even among motorists some of the terms used with reference to tires are not understood. "It is really surprising," says James A. Braden, of the Diamond Rubber Co., "how many different names and terms automobile owners use in referring to different tire parts and conditions. Some of them have become generally adopted words and phrases. New things in up-to-the-minute dictionaries will be about as follows:

**Bead**—that part of a clincher tire casing which hooks into the clinch or curvature of the rim.

**Carcass**—The body of a tire with tread removed.

**Flap**—A fabric lip or band running around the inner circumference of a Quick Detachable casing, serving the dual purpose of protecting the tube from pinching under the beads and rust of the rim.

**Fabric separation**—The separating of two or more plies of fabric. Usually due to moisture, sand or dirt entering the tire through a cut or by reason of tires being insufficiently inflated. As the plies rub upon one another they may give way, causing a blowout. The fabric of tires rightly made of first-class materials, will not separate except for the causes mentioned. Prompt repairs of cuts, and other preventive measures are the remedies.

**Pinch**—Used with reference to tubes. An injury caused by tube being squeezed between rim and casing, staybolt and casing or other surfaces. Can be patched, though vulcanized repairs are better.

**Sand Blisters**—Lumps on tires caused by sand or foreign substances working into the tread and between the rubber and fabric, through cuts or punctures. Prompt repairs highly desirable.

**Stone Bruise**—An internal injury to the tire casing usually caused by violent collision with some blunt projection. Hard to detect until revealed by the blowing out of the tube. If believed to exist can usually be found by very close inspection, the rubber and fabric of the deflated tire bending more easily at this point. A repair in time will save inevitable mishap on the road and also save the inner tube."

### Incidental Advantage of Front Brakes.

One advantage of the front wheel braking system, which is coming into use abroad to some extent, is that when making tire replacements on the driving wheels, there is no need to block up the front wheels to prevent the vehicle from rolling off the jack. The front brakes readily take care of that difficulty and relieve the driver of considerable annoyance.

**A. A. A. FIXED PENALTY SCHEDULE**

**How Future Reliability Contests Must be Scored—Other Requirements that will Apply to Such Events.**

Chairman Butler, of the A. A. A. Contest Board, this week made known the details of the fixed penalty schedule which has been adopted for use in connection with reliability contests, and which is applied at the final examination of the cars at the completion of a contest. In this schedule each of the essential parts of a car are given a definite number of points penalty for defective condition, greater or less, according to their relative importance to the whole make-up of the car and the condition in which such part is found at the finish of the contest.

The adoption of this schedule at once does away with the somewhat uncertain and indefinite penalty of points of the 1909 rules, for time consumed and money value of material used in placing a car in a safe and satisfactory operating condition, and places each and every contestant upon the same footing, with the same penalties applying to all for each defective and damaged part which the contest may develop; in other words, it reduces the penalization scheme to as nearly as possible an exact and known proposition instead of an uncertain and varying one.

The avoidance of work on a car after final examination and the circulation of time consumed and fractional values of material used, enables a rapid determination of the relative merits of each of the cars and ensures a speedy settlement of the contest after the close of the last day's run. The elimination of fractional penalizations also facilitates the announcement of the score of cars at the end of each day's run during a contest.

**Operative Tests.**

To determine the operating condition of a car at the conclusion of a contest, tests of brakes, clutch, transmission and motor are provided for, with suitable penalties for defective operation.

**Summary of Penalties.**

**Time**—One point per minute, or fraction thereof, late in arrival at any control or checking station.

**Work**—One point per man per minute, or fraction thereof, for labor by driver or passengers.

Two points per man per minute, or fraction thereof, for labor by workmen other than driver or passengers.

Two points per man per minute, or fraction thereof, for replacement of damaged parts by driver or passengers.

Four points per man per minute, or fraction thereof, for replacement by workmen other than driver or passengers.

Three points per occurrence for replenishing gasoline, oil or water, outside of fuel controls.

One point per minute, or fraction thereof, for motor stop when no work is done. No penalty for motor stop during period when work is being done on car, for which work or replacement a penalty is imposed.

**Final Out-door Operative Tests.**

**Brake Penalties.**—50 feet perfect; for each foot, or fraction thereof, over this distance, 1 point.

**Clutch.**—5 points for failure to climb curbs, spin rear wheels or stall motor.

**Gear Set.**—25 points for failure to drive on any forward speed or reverse.

**Motor Test.**—5 points for each cylinder not firing.

**Front and Rear Axles.**—No penalty for one-fourth inch spread between wheels; 5 points for each additional one-eighth inch, or fraction thereof.

**Springs.**—No penalty for sag of one inch; 5 points for each additional one-half inch, or fraction thereof.

**Final Examination Penalty.**

At the close of the contest, each competing car, after being properly washed, shall be delivered to the Technical Committee, who shall record all adjustments, replacements or repairs necessary to place each car in a safe and satisfactory condition, and penalties therefor shall be imposed in accordance with the following Fixed Penalty Schedule:

**Lubrication.**

Broken oil feed .....	3
Inoperative oil feed .....	3
Leaky oil connection .....	1
Loose oiler .....	3
Disabled oiler .....	20
Lost grease cup .....	2
Loose grease cup .....	1

**Carburation.**

Broken gasoline line .....	2
Leaky gasoline line .....	1
Leaky gasoline tank .....	1
Leaky gasoline petcock .....	1
Disabled throttle control .....	15
Broken or loose manifold .....	15

**Brakes.**

Broken operating devices .....	100
Broken brake .....	100
Loose operating devices .....	25

**Running Gear.**

Broken spring leaves, each .....	5
Broken spring clips, each .....	15
Broken spring seating .....	15
Loose spring clip .....	1
Loose spring horn .....	15
Broken frame side member .....	500
Broken frame cross member .....	150
Bent frame pieces .....	75
Broken strut rods .....	25
Broken torsion rod .....	25
Lost muffler .....	5
Broken muffler .....	3
Loose muffler .....	2
Broken wheel .....	100
Loose wheel spoke .....	5
Broken wheel spoke .....	10
Broken running board .....	6
Broken fender iron .....	6
Broken fender .....	5
Loose fender .....	2
Lost mud apron .....	8
Broken mud apron .....	5
Broken rear axle .....	300

**Cooling.**

Leaky water connection .....	1
Leaky radiator .....	20
Loose radiator .....	4
Disabled water pump .....	15
Inoperative fan .....	2

Leaky water jacket .....	50
Fan belt off .....	1

**Ignition.**

Loose terminal .....	1
Broken terminal .....	2
Dead battery .....	2
Lost commutator cover .....	2
Disabled commutator .....	20
Inoperative ignition control .....	5
Disabled magneto .....	20
Loose magneto .....	4

**Steering.**

Broken tie rod or drag link .....	200
Bent tie rod or drag link .....	25
Broken steering rod .....	200
Bent steering rod .....	25
Faulty steering gear .....	200
Loose steering connections .....	15
Broken steering knuckle .....	150
Bent steering knuckle .....	15
Broken front axle .....	300

**Machinery Parts.**

Broken valve .....	5
Broken or impaired valve spring .....	2
Broken cam .....	500
Broken camshaft .....	200
Broken crankshaft .....	500
Bent crankshaft .....	250
Broken valve rocker arm .....	10
Broken push or valve lift arm .....	10
Broken transmission shaft .....	100
Broken cardan shaft .....	100
Broken driving chain .....	30
Broken gear or pinion .....	25
Broken bearings .....	10
Broken body or chassis bolts .....	2
Loose body or chassis bolts .....	1
Lost body or chassis bolts .....	2
Broken clutch .....	250
Broken or impaired universal joint .....	50
Broken or lost bonnet fastener .....	2
Loose bonnet gasterers .....	1
Broken or impaired sprags .....	5
Broken shock absorbers .....	5
Loose shock absorbers .....	2

**Steam.**

Leaky condenser .....	20
Leaky generator .....	50
Faulty thermostat .....	20
Faulty pilot light .....	20
Faulty flow motor .....	20
Faulty gauge .....	5
Steam leak in line .....	1
Water leak in line .....	1

(In cases of leaky radiator or water jackets, recognition must be taken of the degree of leakage and the amount of fixed penalty modified accordingly.)

**Grades of Contest.**

Reliability contests are graded as follows:

**Grade 1.**—A contest not exceeding six (6) days in duration, with penalties for time, road work, final operative test and final technical examination.

**Grade II.**—A contest of more than six (6) days duration, with penalties for time, road work, final operative test and final technical examination, except that carburetter and brake adjustments may be made without penalty and spark plugs may be changed.

**Grade III.**—A contest of any duration in which penalties are imposed for time and road work only, but in which the final operative test and final technical examination are omitted.

**Grade IV.**—A contest of any duration in which penalties are imposed for time only.

**Non-Stop Run.**

For the "perfect road score" of the old rules there has been substituted a "non-stop run," defined as follows:

A run without an involuntary stop of the

car outside of controls, except for tire trouble or on account of traffic congestion, shall be known as a non-stop run.

The motor must be kept running continuously while outside of controls.

The car may be brought to a standstill at any time, no work being done, and the motor kept running.

Stops for tire repairs or replacements with the motor kept running, are permissible.

Non-stop certificates may be issued to contesting cars in Grades 1 and 2 who conform to the requirements of the "Non-Stop" definition in a contest exceeding 1,000 miles in length.

#### Car Equipment.

Just what equipment a stock car may or may not carry in reliability contests is very clearly laid down. It may carry special mud aprons in front of radiator or bonnet screens between the side members of the frame; rubber bumpers for springs, and rebound straps; tire inflating tanks. It may not have special springs or spring windings; shock absorbers may not be added unless part of regular equipment, and covers over coil boxes, magnetos or any other part of mechanism, or screens around carburetter, are not permitted unless part of regular equipment.

#### Tools.

Tools are carried in a special bag and sealed, the observers only having access to same.

#### Parts.

Parts carried are inventorized, officially checked and sealed.

**Tire Repairs.**—There shall be no penalty for tire repairs, provided the engine be kept running while the repairs are being made and no other work is done. The time consumed in making the repairs, while the engine is running, shall be added to the day's running time.

**Oil, Gasolene, Water and Batteries.**—At noon or night controls, tanks for lubrication oil, gasolene and water may be filled without penalty.

For replenishments of oil, gasolene or water at any other places the penalty is 3 points for each occurrence.

Oil or grease may be added to or may be drawn off the various cases when necessary without penalty during the half hour allowed for oiling at the end of each day's run.

Recharging of batteries will be allowed at any time, but all work in connection therewith must be done in the presence of the observer.

#### Seals.

To enable an observer to keep a more accurate record of work done on a car, metal and wire seals will be affixed to the bonnet, coil box, transmission case, differential case, mud pan or apron and parts of ignition system not protected by bonnet seals and any other parts, as may be necessary. There will be no penalty for breaking a seal, which will be replaced at the official garage at the end of a day's run, but the observer will note the seal broken and must report how many times thereafter access was had to the part or parts protected by such seal.

#### Lubrication.

A half hour is allowed at the end of each day's run for proper lubrication of the car in the official garage, seals being broken for this purpose and replaced.

#### Observers.

The rules concerning observers have been broadened and strengthened and the duties of observers enumerated in greater detail than heretofore, the following rule among others having been added:

Observers must not interpret rules for entrants or drivers and cannot say what work may or may not be done without danger of penalization, their duties being solely to record what is done and the exact length of time consumed in doing it.

To induce entrants, who appoint observers, to use the greatest care in their selection, the following penalty is imposed on an entrant for the act of the observer he has appointed:

If an official observer shall desert a disabled car without first obtaining the driver's signature to a statement that he has withdrawn from the contest the entrant who appointed such observer shall be disqualified and must either withdraw from the contest altogether or continue as a non-contestant. By desertion is meant leaving the car without taking with him the driver and passengers. This rule will disqualify but one of the cars of an entrant in case of multiplicity of entries.

#### Optional Provisions.

The following provisions, the adoption of which in any contest is optional with the promoter, and none of which count against a car or are factors in determining the car's road score, have been added:

Rules for tire penalizations;

Rules for penalization of accessories;

The keeping of a record of lubricating oil and of gasolene consumption.

#### Classification for Daily Running Time.

Reliability contests shall be held under Class "A" (price classification) only and run in the seven divisions of such class, as follows:

Division 1A.....	\$800 and under
Division 2A.....	801 to \$1,200
Division 3A.....	1,201 to 1,600
Division 4A.....	1,601 to 2,000
Division 5A.....	2,001 to 3,000
Division 6A.....	3,001 to 4,000
Division 7A.....	4,001 and over

on which the daily running time of the cars is based.

The following average speeds shall be maintained by the cars in the respective divisions:

	Miles per hr.
Divisions 4A, 5A, 6A and 7A.....	20
Divisions 2A and 3A .....	18
Division 1A .....	16

#### Body Equipment Classification.

Stock cars only are eligible, and for the purpose of trophy awards shall be divided into two classes according to body equipment: (1) touring car class; (2) runabout

class, including runabouts, miniature tonneaus, surreys and double or single rumbles.

#### Actor Hale Again Plays Author's Part.

Mr. Walter Hale went abroad again last summer, and the record of his trip has just appeared in the form of the neatly illustrated little booklet, "Leaves from a Motorist's Log Book," which sets forth the itinerary of his circular trip through France, Spain, the Riviera and a bit of northern Italy; and also records some bright and sparkling incidents by the way. Besides knowing how to act, meaning to play a part as well as to behave—Mr. Hale is a Thespian by profession—the author has the gift of condensation and tastefully omits all needless language. The booklet affords a striking testimonial to the efficiency of the Studebaker car, which conveyed the party nearly 4,000 miles at less than three cents a mile, and also less than first class railroad fare on the Continent. It also affords some useful information about the costs of transoceanic freighting, customs formalities and taxes. The pictures, which evidence the "fitness" of the car all through its journey were taken by Fred Niblo, a fellow actor of the author's, who figures in some of the incidents mentioned. The booklet has been issued for free distribution by the Studebaker Automobile Co., South Bend, Ind.

#### Philadelphia Strike Boosts Automobiles.

Although the street car strike in Philadelphia brought considerable hardship upon many people, automobile owners, manufacturers, and dealers, as well as chauffeurs, were not among the losers. Every old kind of a machine was put in service and still the conditions were not half met. People who had been in the market for cars and had been delaying the matter, placed hurry orders at the beginning of the strike. In many cases agents had to sell their demonstrating cars to fill hurry orders. These demonstrating cars sold, have in many cases brought a premium. The union taxicab chauffeurs' sympathetic strike did not affect the chauffeurs employed by private owners, who were much overworked helping friends of the family to get around.

#### Oberammergau Open to Motor Cars.

The famous little Bavarian village Oberammergau, where every ten years the great Passion Play is enacted, has this year made an exception to its standing rule of refusing motor cars to be operated within its limits, as a special concession to foreign automobile owners who contemplate visiting the quaint village during this year's Passion Play, May to October. Not only has the ordinance forbidding the use of automobiles been rescinded during the time of the play, but the Passion Play committee has even built a fire-proof garage with accommodations for 200 cars and their attendants, and has made contracts with a leading firm to keep the roads free from dust by the use of oil or some other binding material.

THE NEW  
**Rambler**

Rambler Fifty-three, 34 h. p., \$1,800  
With Magneto, Lamps and Tools.

*Rambler  
Testing Laboratory*

Power tests are taken of seventeen individual Rambler motors at a time. Every motor is made to deliver its rated power before it is passed. Knowing that the design is right our effort is directed toward obtaining uniform results. Such painstaking tests as these will better secure for the New Rambler its place in the ranks of quality automobiles.

## Club Elections

Preceded by the third annual banquet of the organization, the Hornell (N. Y.) Automobile Club held its annual election of officers last week with the following result: A. J. Deer, president; George Peters, vice-president; E. F. Nicholson, secretary and treasurer.

Twenty motorists of Bishopville, Ga., have organized the Bishopville Automobile Club, with the following officers: H. W. Woodward, president; Dr. S. B. Du Bose, vice-president; J. D. Stuckey, secretary and treasurer. The club will mainly devote itself to securing good roads.

Starting with 15 members, the Red Lake Falls (Minn.) Automobile Club has been formed with the following officers: Samuel Gibeau, president; Joseph Helm, Sr., vice-president; Joseph Helm, Jr., secretary and treasurer; directors, Charles E. Broughton, Dr. J. C. Wilkinson and V. M. Higginbotham.

The Dayton (Ohio) Automobile Club has been organized with the following officers: Carroll Sprigg, president; Cyrus Meade, first vice-president; Harvey Kitteridge, second vice-president; Philip Warman, secretary; Rufus Jones, treasurer; board of governors, Irvin G. Kumler, Carl Baumann, E. L. Edwards and John Null.

Officers for the coming year have been elected by the Du Bois (Pa.) Automobile Club, as follows: J. G. Miller, president; Dr. G. W. Gann, vice-president; H. B. Linggle, secretary; A. P. Holland, treasurer; board of governors, John R. Prothero, S. R. Van Tassel, and M. I. McCreight. Seven new members were admitted, raising the total to 55.

Edward Kneeland was unanimously re-elected president of the Automobile Club of Pittsburgh, Pa., at its annual meeting. The other officers chosen are as follows: Edward Kent, William N. Murray and William A. Seif, vice-presidents; Paul C. Wolff, secretary, and William A. Heyl, treasurer. During the past year 149 new members were admitted.

At the annual meeting of the Amarillo (Tex.) Automobile Show Association, the following officers were elected for the ensuing year: John McKnight, president; Lewis Myers, vice-president; Carl Pool, secretary, and Stewart Miller, treasurer. A two days race meet will be held during the convention of the Panhandle Stockmen's Association, April 5-6.

Officers for the coming year have been elected by the Automobile Club of Hudson County, N. J., with headquarters at Jersey City, as follows: Frank B. Stratford, president; Alfred H. Howe, vice-president;

B. H. Ellis, secretary; J. V. Z. Anthony, treasurer; board of governors, James H. Edwards, L. A. Opdyke, Henry Spence, Benjamin E. Farrier and R. R. Row.

The Prescott (Ariz.) Automobile Association is the style under which motorists of that heated section have organized, with the following officers: F. W. Foster, president; Charles T. Joslin, vice-president; H. D. Aitken, secretary, and O. A. Hesla, treasurer. The initiation fees and dues will be devoted to the furtherance of the cause of good roads, which are sadly needed in the locality.

Canton (Ohio) motorists have organized the Automobile Club of Stark County and elected the following officers: J. H. Kenny, president; Charles Steese, Jr., vice-president; W. A. Hoberdier, secretary and treasurer; board of governors, Edward E. Bender, J. R. Dangler, Jr., John Sharer, W. J. Stolzenbach and J. G. Best. The club, which is open to all motorists in the county starts off with 126 members.

At a meeting of enthusiastic motorists held at Champaign, Ill., last week, the Champaign County Automobile Club sprang into existence with the following officers to preside over its destinies: E. S. Swigert, president; Jesse Kirkpatrick, vice-president; C. H. Johnston, secretary, and W. P. Spalding, treasurer. Thirty names were on the charter list and it is hoped to double the membership in a few weeks.

Enthusiastic motorists of Cobleskill, N. Y., have organized the Cobleskill Automobile Club and elected the following officers for the ensuing year: Leland Hodge, president; John R. Becker, vice-president; W. H. Golding, secretary; V. M. Bellingier, treasurer; directors, Dr. John J. Beard, Charles J. Borst, Charles Hallenbeck and Charles Rose. The club, which starts with 35, will affiliate with the American Automobile Association.

Organization of the Huntington (Pa.) Motor Club has been perfected and the following officers elected for the coming year: H. W. Koch, president; J. B. Kunz, vice-president; A. W. Reed, secretary; R. J. Mattern, treasurer; boards of governors, C. H. Miller, W. M. Henderson, G. E. Simpson, Thomas E. Africa, H. M. Kinsel, John White, E. M. Africa, Charles A. Vuille and Dr. C. V. Mierley. Forty-eight names are on the charter roll.

Automobile owners of Malone, N. Y., have formed the Malone Automobile Club and elected the following officers: Joseph F. Wright, president; M. A. Leonard, vice-president; W. J. Goff, secretary; A. N. Henderson, treasurer; governors, E. E. Hogle, M. J. Slason, Dr. C. A. Hasting, W. J. Mearse and J. B. Twaddle. Twenty-six names were on the charter list. The promotion of good roads, favorable legislation and the general welfare of motorists are the objects of the club.

For the fifth consecutive time, Ira M. Cobe was re-elected to the presidency of the Chicago Automobile Club at the annual meeting of that organization. The other incumbents were the following: T. N. Koehler, first vice-president; T. J. Hyman, second vice-president; C. A. McDonald, secretary; George S. Whyte, treasurer; directors, Fred W. Blocki, J. F. Gunther, B. B. Johnson, Allen S. Ray, Claude Seymour and Harry Vissering. The secretary reported a membership total of 881, a gain of 171 for the year. The treasurer also reported a healthy balance.

La Moviganta Klobò, otherwise the Quaker City Ladies' Motor Club of Philadelphia, Pa., just has held its annual election, and the following matrons were elected to guide its destinies during the ensuing twelvemonth: Mrs. Joseph J. Martin, president; Mrs. William Ingram and Mrs. Charles Snyder, vice-presidents; Mrs. H. B. Finck, secretary and treasurer; directors, Mrs. Mary Martin, Mrs. Charles Murtha, Dr. Catherine Sweeney, Mrs. David Ward, Mrs. O. W. Schaum, Mrs. M. L. Wallace, Mrs. Richard Filbert, Mrs. C. Kugler, Mrs. Herbert Reading and Mrs. Stoerr.

John E. Fitzgerald heads the newly organized Hammond (Ind.) Automobile Club which has perfected its organization. The other officers elected are the following: J. G. Albach, vice-president; George B. Sheerer, secretary; R. L. Winkler, treasurer; board of managers, W. B. Conklin, J. T. Hutton, John Lavine, A. M. Turner and C. H. Stewart. The energies of the club will be devoted to road improvement, and also to the rounding up of persons who throw broken glass, nails or other enemies of tires in the street, a standing reward being offered for information leading to their arrest and conviction.

Motorists residing in Coatesville, Pa., and vicinity have organized the Inter-county Good Roads Association, and elected the following officers for the ensuing year: C. K. Paxson, West Sadsbury, president; Dr. S. H. Scott, Lenover, first vice-president; Harry Chalfant, Lenover, second vice-president; Dr. Donald McCaskey, Witmer, secretary; Jonas Newhauser, Bird-in-Hand, treasurer. Organized primarily to secure the improvement of Lancaster Pike between Coatesville and the Gap, they have raised several thousand dollars for the purpose, and upon its completion will devote their efforts to other poorly kept highways in the vicinity.

### Bazaar to Sell a Motor Car.

The managers of the French hospital bazaar to be held at the Metropolitan Opera House, New York, during the week of April 5th, have purchased a Chalmers "30" touring car, to be sold at the bazaar. This is said to be the first time an automobile has formed part of the merchandise offered for "sale" at a charity bazaar.

## RECENT PATENTS.

946,555. Vehicle Shock Absorber. Henry Muehlhausen, Jr., Johannes Thomsen, Chicago, Ill. Filed Sept. 23, 1908. Serial No. 454,289.

1. A frame clamp for a shock absorber, comprising a pair of jaws adapted to engage with an angular frame piece, said jaws being provided with coating beveled surfaces, and a screw connecting said jaws for forcing them together and into engagement with said frame piece.

946,557. Reinforcement for Pneumatic Tires. Albert L. Murray, Grand Rapids, Mich. Filed June 28, 1909. Serial No. 504,907.

1. In combination with the casing and the inner tube of a pneumatic tire, an intermediate tube opened and over-lapped along the entire length of its periphery, said over-lapping portions made to interlock to form, under pressure, an air tight connection, and several thicknesses of reinforcing fabric having the warp and woof at various angles and fully impregnated with and made a part of the material of which the tube is made.

946,632. Carburetter William K. Bassford, Perth Amboy, N. J. Filed Feb. 19, 1909. Serial No. 478,804.

In a carburetter, the combination of a casing forming an air chamber, a tubular gasoline nozzle, extending into said chamber, and having a rectangular port running along the side of the nozzle, a valve extending into said nozzle, for covering said port more and more in direct proportion to its distance in the nozzle, and means governed by the air passing through said chamber for adjusting the valve along the length of said port.

946,638. Tire. David W. Jones, Taunton, Mass. Filed Dec. 8, 1905. Serial No. 290,881.

In a tire, the combination with a pneumatic tube; of a concave annular member of sheet metal fitting over and conforming to the outer surface of said tube; a tread portion seated on said annular member; transverse channels shaped in said annular member, the under side of which channels form projections to engage the surface of the pneumatic tube; annular clamping members; and clamping bolts extending through said clamping members and said tread portion, and seated in said transverse channels, substantially as described.

946,661. Compression Tester for Explosive Engines. John Desmond, Chicago, Ill., assignor to William S. Potwin, Chicago, Ill. Filed March 20, 1908. Serial No. 422,216.

1. A compression tester for explosive engines comprising a sleeve-like casing, a relief valve seated in said casing, a spring for holding said valve to its seat and a thimble adjustably screw threaded upon the end of said spring to adjust the pressure thereof, said thimble having escape ports and said casing having a scale with which said thimble co-operates to indicate the pressure of said spring, substantially as described.

946,674. Means for Securing a Spare Rim to the Wheel of a Vehicle. William R. Hughes and Philip Cave-Moyle, Cheltenham, England. Filed July 17, 1908. Serial No. 444,055.

1. In means for securing a spare rim to the wheel of a vehicle the combination of

a retainer carried by the rim and adapted to engage the outer flange of the permanent rim, and prevent radial movement of the spare rim, a cramp adapted to engage the inner side of the wheel and to prevent axial movement of the spare rim, and a lever pivoted to the spare rim and also to the cramp.

946,717. Means for Tire Inflation. Luther S. Brown, Lemoore, Cal. Filed Nov. 7, 1908. Serial No. 461,575.

The combination of an axle, a wheel having a pneumatic tire provided with a valve, a hub formed with a duct and a nipple, and a spoke formed with a bore, a pipe connected with the nipple at its inner end, a union connecting the outer end of the pipe with the valve, an inner member formed

with an annular groove connected with the duct in the flanged hub and provided with a flange, a split outer annular member formed with a passage and a nipple, means for securing the parts of the outer annular member together, a bracket fixed to the axle, and springs yieldingly connecting the outer annular member with the bracket.

946,737. Pressure Regulated Gas Valve for Engines. Marie L. Riotte, Jersey City, N. J., administratrix of Carl C. Riotte, deceased. Filed March 1, 1909. Serial No. 480,690.

1. In a mixing and regulating apparatus for gas and air, a housing having an outlet, an air inlet and a gas inlet, two cut-off devices mounted one within the other and

# HAYNES

## TRUE ECONOMY IN A MOTOR CAR PURCHASE

Any man who can afford it can secure a permanent satisfactory automobile for \$3000.

But that isn't economy any more than paying \$1500 for a temporary machine.

In either case you pay too much.

For one, too much at the start. For the other, too much in the end—through excessive cost for up-keep that is always the result of buying a cheap car. The

## Haynes Model 19

### \$2000 Fully Equipped

is true economy. It has everything on it or in it that is worth having in an automobile. It is a roomy, handsome, luxuriously appointed 5-passenger car that can only be classed with cars selling for at least \$1000 more. Its faultless mechanical construction makes it a remarkably economical car to run. The maker's reputation is a guarantee of quality. The Haynes organization has never built anything but a high class car. This Model 19 was built to fill the need of a moderate-sized, moderate-priced car of known quality. A car that would appeal to informed motorists.

**It is the only car of established reputation selling at a moderate price.**

Only the Haynes experience made possible the production of such a car at such a price. It is a distinct achievement in motor car building. Send for our descriptive booklet and let us tell you where you may secure a demonstration.

**HAYNES AUTOMOBILE CO.**  
Station C KOKOMO, IND.

manually adjustable relatively to each other and to said air and gas inlets to vary the relative proportions of gas and air passing to said outlet and mutually adjustable to permit the passage of a greater or lesser quantity of gas and air to said outlet without varying substantially the proportions determined by manual adjustment both of said cut-offs and the housing having ports arranged to register simultaneously and directly with each other.

946,806. Vaporizer Heating Device. Alden E. Osborn, New York, N. Y. Filed Jan. 13, 1906. Serial No. 295,882.

1. In a motor vehicle, an internal combustion engine, a body or casing inclosing the same, means outside of said casing for illuminating the path of the vehicle and also operating to generate waste heat, and means for forming an explosive charge and delivering the same to the engine, said last-mentioned means having a portion thereof heated by said illuminating means and utilizing said waste heat.

946,878. Spark Plug. Joseph E. Schaefer, Jr., Cleveland, Ohio, assignor to Charles W. Fenner, Cleveland, Ohio, doing business under the name Reflex Ignition Co., Cleveland, Ohio. Filed Feb. 23, 1909. Serial No. 479,379.

A spark plug comprising a casing having a rounded end which is provided with a central opening and small openings arranged adjacent to said central opening, the wall around said central opening constituting an electrode and the central opening and openings adjacent the central opening permitting admission and exhaust of gas to and from the casing, a spindle arranged within the casing and insulated therefrom, an electrode carried by said spindle, and a saucer-shaped baffle on said spindle and turned toward the openings in the rounded end of the casing, said baffle serving to catch the oil driven into the casing with the gas.

946,953. Shock Absorber for Automobile Driving Shafts. Conde A. Benoist, St. Louis, Mo. Filed Feb. 5, 1907. Serial No. 355,933.

The combination with a driving shaft, constructed in two parts, of flanges integral with the meeting ends of the two parts of the shaft, an arm formed integral with each flange, the outer ends of which are in alignment with one another, a rod loosely fitting in the apertures formed in the outer ends of said arms, the ends of which rod are screw threaded, nuts located on the screw threaded ends of the rods, a compression spring arranged on the rod between the ends of the arms, and of such dimensions to prevent the ends of the arms abutting; a centrally arranged pin integral with and projecting from the end of one of the shafts and engaging in a corresponding recess formed in the opposite portion of the shaft, there being a groove formed in said pin, and a set screw passing through that part of the shaft provided with the recess, the inner end of which screw engages in the groove in the pin.

947,021. Starting Explosion Engines. Jules E. Malivert, Paris, France, assignor of one-half to Louis Bousquet, Paris, France. Filed March 6, 1909. Serial No. 481,570.

1. The combination with an explosion engine having a plurality of cylinders, of a plurality of sources of fluid under pressure, a valve casing for each cylinder and communicating therewith and communicating with both of said sources, a valve for closing the communication between one of said sources and the cylinder, a diaphragm in the

casing for controlling the valve and arranged between the port leading to the other source and the port leading to the cylinder, one face of the diaphragm being subject to the pressure from the other source and the other to the pressure of the cylinder, and a rotating valve driven by the engine for successively interrupting the communication between the said other source and the valve casings.

**SAFETY TIRE GAUGE**  
  
**PRICE \$1.50** ALL DEALERS or by mail on receipt of Price and 6c. postage.  
**SAFETY TIRE GAUGE CO., 1463 Hickman Ave., Chicago**

When you sell accessories and supplies your profit is meager or generous, according to how you have bought them, and that is a real reason why you should have a Post & Lester Co.'s catalog and **CONFIDENTIAL** net trade price book—which costs you nothing.

"How is it," some dealers ask, "that you are able to give such splendid service to Middle West and Southern dealers as well as to the New England trade, without your having a New York or Chicago headquarters?"

Perhaps we can give you a hint of how we do it, by saying we could have a New York or Chicago place the minute we want it. But we don't want one. Enormous expenses are saved in rent for offices, shipping departments, stock rooms and storage space by our having them outside the expensive metropolitan district.

We do business on an enterprising, thrifty, economical and progressive basis, without lavish and extravagant mahogany desk and fifty-cent cigar settings, but with a big cash capital that takes every discount and that gives us every buying advantage.

Then, too, we have been handling automobile accessories for 16 years, supplying the experimenters long before motor cars

generally were placed on the market, and selling to automobile manufacturers and dealers ever since, so that our experience makes us the closest buyers in the business, as the accessory manufacturers sometimes confess with wry faces.

But if we are close in our buying and in our own expenses for doing business, it is in order that we may be liberal with the dealers, on whom our business depends; and the low prices and progressive policy which we give you will make your accessory department a success.

Consult with us freely, and write immediately for the big 1910 Post & Lester Co.'s catalog of standard accessories and supplies and the **CONFIDENTIAL** net trade price book. Do not send a postal, but show us your business letterhead or card, and then we'll know you are actually in the trade and we will be able to talk to you freely. Address **GENERAL SALES MANAGER**.

## **RAILROADS READY TO RAISE RATES**

**Increases Likely to be Substantial Ones—  
Dealers Indifferent and Fail to At-  
tend the Hearing.**

If the automobile dealers east of Chicago care very much whether the freight rates on motor cars are raised 25 per cent. or more, they at least gave very little evidence of it at the meeting of the official classification committee of the railroads in the eastern district, which was held in New York City on Tuesday, 29th inst. The railroads have for some time been contemplating the raising of the rates on automobile shipments, and the classification committee was prepared on Tuesday to hear from dealers and others as to why the raise should not be put into effect. If the committee expected to hear loud protests and arguments from the dealers, however, it was disappointed, because no dealers appeared.

The advances which the railroads are understood to have in mind would be at least 25 per cent. on carload shipments and probably 50 per cent. or more where single machines are shipped. As these increases must fall either on the dealer or his customers it was thought that strong representations would be made to the classification committee by the dealers, in opposition to any such steps by the carriers. For this reason the absence of dealers at the hearing was regarded as little less than remarkable.

Although their notice was short, prominent dealers in Boston and New York were advised of the situation, and many of them in immediate indignation expressed their intention of being on hand to tell the committee the injustice of putting further burdens on a class of business from which the railroads already get so much. The Boston delegation did not arrive, and the New Yorkers likewise failed to find their way to the hearing.

Some opposition to the proposed increases was made, nevertheless, as J. S. Marvin, general traffic manager of the National Association of Automobile Manufacturers, together with a delegation of the makers, appeared before the committee and presented facts and figures to show why the advances should not be made. In addition to resisting further raises in the rates, the automobile delegation pointed out some of the existing injustices which result from the system of charging double the first class rate on a minimum weight of 2,500 pounds, where a single machine is shipped, as against the single first class with a minimum of 10,000 pounds if the automobiles are shipped in carload lots.

It will not be known for some time what action the classification committee will take. The hearings of the committee are held semi-annually and the decisions as to increases or decreases are not promulgated until long after these deliberations, so that the increase, if decided on, will not become effective for some months.

### **Kelly to Locate in Racine.**

Although originally intended for Toledo, O., the new rubber company which Charles F. U. Kelly has had in the making for some months, is to be located in Racine, Wis., and has been incorporated under Wisconsin laws as the Kelly-Racine Rubber Co., with a capital stock of \$500,000. The new company, of which Kelly is the president, and which will make automobile, commercial truck, motorcycle and bicycle tires, has purchased ten acres of land in Racine for a factory site, and construction is to be started immediately on a fire proof plant. It is expected to have 250,000 square feet of floor space available for active manufacturing operations in the latter part of July, and an output of 300 tires per day from the start has been promised. The change in plans by which Racine instead of Toledo, becomes the home of the company, was brought about by the substantial inducements that were offered by Racine business men, a number of whom have become associated with the enterprise.

## **STANDARDIZED RIMS PULL THROUGH**

**Tire Manufacturers Unexpectedly Get To-  
gether Again and Readopt Them—How  
Situation Now Stands.**

Instead of being dissolved as the result of the indifference exhibited toward it by the tire committee of the Association of Licensed Automobile Manufacturers, the project for a standard type of quick detachable rim, as evolved by compromise on the part of six big tire companies, has taken a new lease of life and is to be pushed with vigor. Tangible evidence to this effect is afforded in the official announcements made this week, over the names of the companies that have assigned their rim patents to the United Rim Co., the patent holding corporation created for the purpose.

As previously indicated in the Motor World, the plan for a standardized type of quick detachable rim has been making difficult progress for the past two years, but those who have championed it are now convinced that it has reached a point where it may be put squarely before the trade and the public. The companies who are pledged to the cause and who have turned over their rival and conflicting patents to the United Rim Co., in order that the later may authorize a composite type containing the best features previously found separately, include the Diamond Rubber Co., Akron, O.; G & J Tire Co., Indianapolis, Ind.; Goodyear Tire & Rubber Co., Akron, O.; B. F. Goodrich Co., Akron, O.; Hartford Rubber Works Co., Hartford, Conn., and Morgan & Wright, Detroit, Mich.

When the United Rim Co. made its initial attempt to create a standard type which would be acceptable from all standpoints, it encountered trouble with the rim manufacturing concerns who were approached on the matter of taking out a license to manufacture. The rim makers balked at being confined to just one type,

which they must needs be under the terms of the license offered them. The United Rim Co. then agreed to license them for two standard types, provided they would give up the manufacture of all competing rims. These two standard types, as promulgated by the United Rim Co., were described and illustrated in the Motor World for the issue of December 23, and were designated as types No. 1 and No. 2. Licenses for their manufacture were taken by the Standard Welding Co., of Cleveland, O., and the Weston-Mott Co., of Flint, Mich., with the understanding that the tire companies themselves would retire from rim manufacture.

Later a dash of cold water was thrown on the whole thing by the attitude of the tire committee of the A. L. A. M., which refused to take any definite steps towards pledging support for the standardized rim idea or to recommend it to the membership of the Association. With renewed courage, however, the standard rim is again taken up and is to be carried to the ultimate of whatever possibilities are in store for it. The No. 2 rim is the type which is to be made the leader, although the rim manufacturers who have taken out a license may make the No. 1 type also if they find reason to do so. The tire companies who have created the United Rim Co. will themselves cease the manufacture and sale of rims on the first of next July, and will use their combined efforts to make the car manufacturers and the public see the advantage of the standardized type, as produced by the licensed rim makers.

#### Dayton Returns to the Columbia.

Succeeding C. W. Kelsey, F. E. Dayton has been appointed sales manager of the Columbia Motor Car Co., of Hartford, Conn., by the United States Motor Co., of which the Columbia company is a constituent. Kelsey's resignation from the United States Motor interests is in the nature of a surprise to the trade, as he long has been identified with the Maxwell-Briscoe Motor Co., and was its sales manager until recently transferred to Hartford. Dayton, who will take charge of the Columbia sales organization on April 1, is not a stranger to the Columbia line, as he was with the Electric Vehicle Co. for five years, acting at different times in the capacity of salesman and branch house manager at Boston and Chicago. For the past two years he has been sales manager of the New York plant of Rogers & Co., which position he resigns to return to the automobile business.

#### Another Car Coming from Kansas.

Wichita, Kan., is to have a car of its very own, in the Wichita, which is to be made by the Wichita Motor Car Co., as the company will be known. The car is designed by D. N. Baxter, of Wichita, who with A. N. Jones and Rudolph Hatfield will direct the affairs of the enterprise.

## TWO JOIN THE "SILENT MAJORITY"

### Death Calls at Detroit and Buffalo and Claims Well Known Men—The Deceased and Their Careers.

#### JOSEPH A. BRISCOE.

Joseph A. Briscoe, treasurer of the Briscoe Mfg. Co., of Detroit, Mich., and father of Benjamin and Frank Briscoe, died at his Detroit residence on the 25th inst. He was 72 years old and had lived in Detroit for over 70 years, although born in Philadelphia. While still a youth he invented a machine for making nuts and bolts, which not only brought him considerable notice in the mechanical world, but which served as the basis for his forming the Michigan Nut & Bolt Works, a concern still in existence. Later in life Mr. Briscoe was connected with the Westerman Iron Works, of Sharon, Pa., and during the latter years of his active business career he was district agent for the Standard Life and Insurance Co., until his retirement two years ago. He retained the treasurership of the Briscoe Mfg. Co., but permitted the active work to rest on younger shoulders.

His relation to the automobile industry was more real than apparent, in his paternal interest in the activities of his sons, not only in the Briscoe Mfg. Co., making automobile radiators and parts, but in the Brush Runabout Co., of which Frank Briscoe is the head, and the Maxwell-Briscoe Motor Co., and its outgrowth, the United States Motor Co., both of which are headed by Benjamin Briscoe.

#### GEORGE N. PIERCE.

George N. Pierce, of Buffalo, N. Y., who might be considered one of the pioneers in automobile manufacture in the United States, died of heart failure on the evening of the 23d inst., in his apartments at the Lenox Hotel, Buffalo. He was 64 years old, and although it is two years since he had any active connection with the motor car industry, he nevertheless was popularly regarded as one of its "grand old men."

In 1890 he organized under the firm name of George N. Pierce & Co., for the manufacture of bicycles, and became one of the leading manufacturers. Nine years later the firm commenced experimenting with automobiles, and in 1900 it produced a 2¾ horsepower motorette, followed in succeeding years by increasing horsepower and larger models, including a two cylinder touring car of 15 horsepower in 1903. So rapidly did the automobile department of the business grow that in 1906 it was found necessary to divide the firm into two organizations, the automobile branch being styled the George N. Pierce Co., while the cycle branch became the Pierce Cycle Co.

Because of advancing years and a desire

to relinquish business cares, Mr. Pierce two years ago disposed of all his interests in the George N. Pierce Co., and retired as president and director, whereupon the company was reorganized as the Pierce-Arrow Motor Car Co. He did not retire completely from the cycle company, however, and remained one of its directors. Mr. Pierce is survived by his wife, six daughters and two sons. The directors of the Pierce-Arrow company have passed resolutions of sympathy.

#### Miller Again Gets More Room.

Charles E. Miller, the New York jobber, importer and manufacturer of automobile accessories, has found it necessary to expand his main headquarters at 97-101 Reade street. To this end he has leased all of the second floor of the building running through the block from 103 Reade street to 121 Chambers street and adjoining his present location. The enlargement is chiefly for the purpose of increasing the facilities necessary for taking care of his branches in various cities, of which there are ten, in addition to his main store. The branch at 601-3 Baronne street, New Orleans, La., opens this week. In further preparation for the rush of spring business, Miller has been making record breaking purchases of stock, including a single order with one tire manufacturer for over \$25,000 worth of tires for delivery within a week's time.

#### Consolidation Ends Taximeter Litigation.

By a combining of the Franco-American Taximeter Co. and the Jones Taximeter Co., of New York, the patent warfare which has been in process between them has been brought to an end and their interests have been merged in a new company, which will be known as the American Taximeter Co., with principal offices at 736 Seventh avenue, New York. Both the Poppe taximeter and the Jones type will be continued, the patents all having been transferred to the new company. The uniting companies retain an equal representation on the board of directors, Francois Ducasse acting as president and general manager, and Joseph W. Jones as vice-president.

#### Seiberling Back from Rubber Country.

F. A. Seiberling, president of the Good-year Tire & Rubber Co., Akron, O., returned on Friday from an extensive trip in Brazil, where he visited the Amazon rubber district. In commenting on the rubber situation, he indicated that the demand for rubber always will exceed the supply, but that a reaction from the present high prices may be looked for. He declared, however, that low prices, as formerly understood, are a thing of the past.

#### Locomobile to Build Big Addition.

The Locomobile Company of America, Bridgeport, Conn., has awarded the contract for a four-story additional factory, 152x54 feet. The company also is building a one-story forge shop, 151x50 feet.

**ECCENTRIC METHOD IS PATENTABLE**

**Court Sustains Hess-Bright Claims for Ingenious System of Assembling Ball Bearings—Finds Infringement.**

Involving some of the mysteries by which manufacturers of ball bearings accomplish the introduction of the balls between the concentric rings which provide their path of travel, a suit brought by the Hess-Bright Mfg. Co., of Philadelphia, Pa., to establish its patent rights to the Conrad method of assembling has resulted in a victory for the company in the Circuit Court of the United States for the Eastern District of Pennsylvania. In his decision Judge Holland does not agree with the defendant, the Standard Roller-Bearing Co., in the contention that there is lack of invention in the two patents on which the complainant's suit was brought.

The patents in question are No. 822,723, granted June 5, 1906, and No. 838,303, granted December 11, 1906, to Robert Conrad, and transferred by him to the Deutsche Waffen-und Munitions-Fabriken, a German company, of which the Hess-Bright company by assignment is the sole licensee in this country. The first patent is for an improvement in ball bearings, and the second is a "method patent," issued about six months after the article patent. The first claim of the "method patent" reveals the essence of the matter over which the litigation arose. It is as follows:

1. The method of manufacturing and assembling a ball bearing into a unitary structure the parts of which hold each other together, which consists in forming inner and outer rings having opposing grooves, the sides of which are uninterrupted throughout their circumference, and which are separated by a distance less than the diameter of the balls when the rings are concentric, placing said rings eccentrically to each other to widen the space between said edges at one side to a width greater than the diameter of the balls, introducing through said space a limited number of balls extending when in contact with each other only partly around the raceway formed by said grooves, and restoring the rings to concentric position and introducing spacers between the balls to distribute them substantially entirely around the raceway so as to prevent the rings from returning to the eccentric position."

After relating that most of the many patents issued for ball bearing devices have the sides of the grooves interrupted in one way or another to permit the introduction of the balls, with filling openings provided in some cases and sometimes a further provision for these openings being filled up or plugged after the balls had been introduced, Judge Holland finds the Conrad method to be a distinct piece of invention.

"It is very evident that the manufacturing and assembling of this ball bearing device by eccentric displacement is entirely

new," he declares, "as no other ball bearing has ever been made which could be entirely assembled in this way, resulting in making practical a continuous and uninterrupted raceway. The idea is novel and of great utility, involving invention. It is ordered that a decree be entered for the complainant."

**Big Drop Forge Plant for Detroit.**

At an outlay of \$750,000, the Anderson Forge & Machine Co., of Detroit, Mich., now located at the foot of St. Aubin avenue, Detroit, is to build an immense drop forge plant on a 13-acre site some distance out on Jefferson avenue. The plant will require the erection of nine buildings, all but one of which will be of concrete. A mile of industrial railway track will be laid for the handling of raw material and finished products. The expansion, it is stated, is brought about by the needs of the automobile industry. The officers of the company are: Russell Alger, president; Fred M. Alger, vice-president; F. Archer Hinchman, secretary-treasurer, and W. R. Anderson, general manager.

**St. Paul to Have a Motor Truck Plant.**

After experimenting during the past year with a light and a heavy truck built by the Schurmeier Wagon Co., of St. Paul, Minn., under the direction of Frank I. Whitney, the Schurmeier interest have incorporated the Schurmeier Motor Car Co., with \$200,000 capital. For the present the new concern, of which Whitney is the president, will build its vehicles at the wagon factory, but a ten-acre site has been purchased in the "Midway district" between St. Paul and Minneapolis for the erection of a plant.

**Lapeer May Back a Watt Factory.**

The Watt Motor Co., which has been exploiting an unusual type of motor in Detroit, Mich., has succeeded in interesting Lapeer, Mich., the citizens of which place have for some time been itching to start an automobile factory there. At a public meeting in Lapeer the sum of \$35,000 was raised and a further \$15,000 is being sought, so that there may be \$50,000 with which to back a motor car plant, the Watt enterprise having been tentatively selected.

**Petrel Plant is Sold at Auction.**

The plant of the bankrupt Petrel Motor Car Co., of Milwaukee, Wis., has been sold in accordance with the order of the bankruptcy court. Attorney John A. McCormick, of Milwaukee, bought it for \$24,100, but declined to say for whom he made the purchase.

**Manning Joins the Warner Forces.**

Irving H. Manning, recently with the American Locomotive Co., has joined the selling force of the Warner Instrument Co., of Beloit, Wis. He will be a special representative of the company and will not confine himself to any one of its branches.

**SELLING STOCK ON EASY PAYMENTS**

**General Motors Placing Shares with Employees—Publicity Production Campaign Helps Market New Issue.**

Almost coincident with a publicity hurrah concerning the magnitude and fecundity of production of its chief constituent property, the General Motors Co. has placed on the market a new issue of its preferred stock and also has disclosed a plan whereby employees may turn back a part of their wages or give up their savings for General Motors shares. To enjoy the opportunity which is afforded them, the employees who wish to have certificates must take \$500 worth of the preferred stock, to which 20 per cent. of common will be thrown in for nothing, this being the kind that was ladled out so liberally last November as a "150 per cent. stock dividend" on the common stock instead of cash.

The money need not all be paid at once, however, as an instalment method has been devised, which is calculated to make the proposition more attractive and more easily within the employees' reach. The scheme provides for 10 per cent. down and 2½ per cent. a month, and is thus as simple as buying a crayon portrait or a Collier set of famous authors on easy payments.

According to glowing dispatches from Flint, Mich., the plan when placed before employees of the Buick factory resulted in a subscription for \$122,000 worth of the preferred stock, which on the basis of payment outlined will mean that the men who subscribed will be paying on General Motors shares for the next three years.

The total amount of the new issue of General Motors stock is given as \$1,000,000. Assisted perhaps by the publicity boom which made so timely an appearance, the demand for the shares was "immediate and heavy," if the veracious chronicler is to be credited, and, in addition to finding buyers in Flint, were disposed of "in Detroit, New York, Cincinnati and other large cities."

**Rubber's Rise Forces up Tube Prices.**

Because of the recent advances in rubber prices, the Empire Tire Co., of Trenton, N. J., has found it imperative to announce an advance of 30 per cent. on its red rubber tubes in the automobile and motorcycle tire sizes. Its gum gas tubing and rolled end gas lamp connections likewise have been advanced 20 per cent.

**Ann Arbor Will Build Automobiles.**

Ann Arbor, Mich., is making preparations to welcome Koch Bros., who propose to build an automobile plant on Wildt street, near North Main. A \$50,000 company has been organized, and \$31,000 worth of the stock is represented as having been disposed of already.

## IN THE RETAIL WORLD.

Richard H. Hefler, Yarmouthport, Mass., will open a garage on Railroad avenue.

Fred Meintz, Peoria, Ill., will erect a garage on the plot at 1416 Main street, now occupied by a livery stable.

J. W. Gilroy, Peoria, Ill., has opened a garage in the old Glide factory, at Bradley avenue and Institute place. Repair work will be featured.

Harry Baumeister, Louisville, Ky., has taken out a permit to erect a one story garage on Broadway near Seventh street. It will cost \$6,600.

S. M. Trammell, Washington, D. C., has disposed of his garage at 1828 L street, N. W., to Simmes & Welbeck. They will continue to operate the business.

A. L. Sheridan, Indianapolis, Ind., a newcomer in the trade of that city, has opened sales rooms at 27-33 North Capital avenue. He will represent Palmer-Singer cars.

Stone & Downey, Philadelphia, Pa., long established farm implement dealers at 1903-1905 Market street, have taken on automobiles. They will represent the Kisselkar.

Richardson & Willson, East Aurora, N. Y., have dissolved partnership and sold their garage on Elm street to Maurice L. Hanivan. He will continue the business in his own name.

The Pope-Hartford Motor Car Co., St. Louis, Mo., has had plans drawn for a new sales and garage building at 5883-91 Delmar avenue. It is expected to be ready for occupancy by June 1.

Whitmore & Houpt, Jackson, Mich., will occupy the new garage to be erected on West Cortland street by Anthony Feldher. The building will be of pressed brick, two stories, 62x120 feet.

Bids are being asked for the construction of a new garage to be built for the McAlister Motor Car Co., Pittsburg, Pa., on Baum street. The structure will represent an outlay of \$25,000.

The Brattleboro (Vt.) Garage, has acquired the establishment of L. D. Taylor, on Grove street, the latter retiring from business. The new owners handle the Velie and Brush lines.

The Automobile Sales and Distributing Co., of 1206 Main street, Buffalo, N. Y., has taken the agency for Brush cars. Western New York and Pennsylvania are included in the territory assigned to it.

The Holt-Boone Motor Co., Atlanta, Ga., which took over the business of Jesse R. Holt, has leased new quarters at 67-70 Edgewood avenue. Its lines comprise the Demot, Marmon and Varsity cars.

The Anderson Electric Carriage Co., Detroit, makers of the Detroit electric automobile, will open a factory branch in Buffalo, N. Y., at 1114-1116 Main street. It provides both sales rooms and garage facilities.

John S. Feters, South Bend, Ind., has sold his interest in the F. & C. Vulcanizing

Co., at 213 East Jefferson boulevard to Charles Frank and Frank May. The new owners will operate under the old name.

B. D. Hobbs and John Roberts, Springfield, Mo., have dipped into the automobile business and opened a garage in the Auditorium building on Pickwick street. The establishment includes a repair department.

One of the largest garages in Massachusetts, of reinforced concrete, 60x145 feet, with accommodation for over one hundred cars, is being built in Salem, Mass., on Lafayette street. Zina Goodell is the owner of it.

The Whittaker Motor Car Co., St. Louis, Mo., has moved from its old location at 2048 Fair avenue to new and more commodious quarters at 1318 Olive street. Everitt touring cars and Hewitt trucks are handled.

The latest addition to the trade in St. Louis, Mo., is the St. Louis Garage Co., which has opened sales rooms at 1127 Olive street. H. F. Rogers is manager of the company, which will dispense the Johnson car locally.

The United Garage Co. has been formed to take over the garage business of the Kirk Bros. Automobile Co. Kirk, who has the Thomas agency, will continue at the old stand, but will have no connection with the garage business.

The Texas Motor Sales Co., Fort Worth, has broken ground for a new home on Commerce street near Eleventh. Its present location is on Throckmorton street. It has also established branches in Dallas and Oklahoma City.

W. M. Jenkins & Co., Boston agents of the Mitchell cars, have taken possession of 228 Columbus avenue, and established themselves in the more spacious quarters. Their former store at 286 in the same avenue, had proven too cramped.

The Wichita (Kan.) Garage Co., soon will take possession of its new home on North Lawrence avenue. Its dimensions are 100x140 feet, and in appointments and equipment the new establishment will rank with the best in the state.

The Thacker-Brereton Co., and Greer-Templeton Co., Peoria, Ill., have consolidated, under the style of the Jefferson Auto Co., in the quarters of the former. The same lines, viz.: Brush, Oldsmobile, and Buick cars, will be continued.

The Ohnhaus Automobile Co., Ft. Wayne, Ind., has absorbed the garage business formerly conducted by Louis Ohnhaus on West Berry street. Ohnhaus is president of the new company, which will add a livery service and conduct the business on a larger basis.

The Anderson-Nelson Motor Car Co., Oklahoma City, Okla., soon will take possession of its new building at 521 West Second street, and one of the largest establishments in the city. It is a brick structure 50 x130 feet, and will be well provided with re-

pair facilities. The firm acts as state distributor of Moline cars.

Motor cars will share honors with horse vehicles hereafter in the establishment of the Woonsocket (R. I.) Wagon Mfg. Co., 12-24 Worrall street, which has taken on the Parry, Empire, Velie, Lexington cars; Manhattan, Rapid and Alco trucks will be handled.

Edward Donnelly and Harry G. Davis, Saginaw, Mich., have embarked in the automobile business and will open a garage at James and Baum streets. Ground has been broken for the structure which will be of brick, one story, 160x40 feet, and will include a repair shop.

O'Brien & Storz is the style of a new firm which has been formed in Omaha, Neb., to cater to storage and repair trade exclusively. It has completed arrangements for the erection of a garage 66x132 feet, two stories, on Farnam street, between Twentieth and Twenty-fourth.

The Toledo Auto & Garage Co., Toledo, Ohio, has finished an addition to its already big garage, 88x220 feet, of concrete and brick. One-half of the garage will be used for housing gasoline automobiles and the other half for electric vehicles. Opening day was on March 28th.

The Kankakee (Ill.) Motor Co., which recently began business, will take possession of its new garage at 315 Dearborn avenue early in April. The building will be one story, 30x70, and will be constructed of brick. E. C. Caulkins and Howard Mann, are the members of the firm which will market Pratt-Elkhart and Everitt cars.

Work has been begun on a new garage to be erected for the Johnson Automobile Co., St. Louis, Mo., at 4388 Olive street, the local "automobile row." It will be one story, 45x154 feet, and will cost \$12,000. A well equipped repair shop will be a feature. The prospective tenant has leased the establishment for a term of five years.

The Barndt & Johnson Auto Supply Co., Columbus, O., who make bodies and accessories, have purchased the factory at High street and Kingston avenue, formerly occupied by the Columbus Woodenware Co., and will remove its plant there when the new home is put in order. It is a brick structure 150x400 feet, and in height varies from two to three stories. Included in the purchase is five acres of land to provide for future expansion.

Two well known automobile firms of Kansas City, Mo., the Woodward Auto Co., and A. J. Davies have consolidated and reorganized as the A. J. Davies Motor Car Co. Temporary quarters have been established at 3626 Main street, pending the erection of a permanent home next door at 3628. A. J. Davies will be president and treasurer, and C. W. Woodward, secretary of the new concern, which will handle the Knox, and the Chadwick, and also Babcock electrics.

## THE WEEK'S INCORPORATIONS.

Waco, Tex.—Waco Automobile Club, no capital. Corporators—W. W. Seley, H. H. Shear, G. T. Zizinia, E. R. Bolton.

Fremont, O.—Lauth-Jergens Motor Car Co., under Ohio laws, with \$150,000 capital; to manufacture pleasure and commercial cars.

Houston, Tex.—Standard Auto Co., under Texas laws, with \$15,000 capital. Corporators—G. F. Cotton, Isaac Keller, E. E. Guthrie.

Detroit, Mich.—Michigan Magneto Co., under Michigan laws, with \$15,000 capital; to manufacture magnetos. Corporators—Henry G. Cox, et al.

Oshkosh, Wis.—Punctureless Tire Co., under Wisconsin laws, with \$50,000 capital. Corporators—G. D. Weed, W. G. Everhard, Ulrich Anderson.

Galveston, Tex.—Galveston Automobile Club, no capital. Corporators—W. L. Moody, Jr., Sealy Hutchings, George Sealy, Bartlett Moore, J. W. Munn.

Wilmington, Del.—Simmons Motor & Truck Co., under Delaware laws, with \$1,500,000 capital. Corporators—W. N. Akers, W. J. Maloney, M. C. Taylor.

New York, N. Y.—Franco-American Tire Co., under New York laws, with \$5,000 capital. Corporators—Timothy H. and James A. Murray, John D. Thomas.

Chicago, Ill.—Interstate Garage Co., under Illinois laws, with \$5,000 capital; automobile livery. Corporators—I. E. Harrod, E. C. Marsh, John S. Thompson.

New Haven, Conn.—Brown & Underwood Automobile Co., under Connecticut laws, with \$12,000 capital. Corporators—H. H. Brown, E. B. Underwood, L. E. Jacobs.

Detroit, Mich.—Porter-Lovette Co., under Michigan laws, with \$15,000 capital; general automobile business. Corporators—Gilbert E. Porter, Harry S. Lovette.

Boston, Mass.—Aluminum Solder Co., under Massachusetts laws, with \$50,000 capital; to manufacture aluminum solder. Corporators—Joseph Silver, George J. Coles.

Dayton, O.—Automobile Club of Dayton, under Ohio laws, no capital. Corporators—H. J. Meyers, Jr., Philip H. Worman, Roy Fitzgerald, R. E. Jenkins, Carrol Sprigg.

Houston, Tex.—Houston Auto Co., under Texas laws, with \$10,000 capital; general automobile business. Corporators—A. J. Dorman, J. M. Walker, W. D. Myers and others.

Ft. Wayne, Ind.—Ohnhaus Automobile Co., under Indiana laws, with \$15,000 capital; general automobile business. Corporators—Louis Ohnhaus, D. U., and O. F. Evans.

Wilmington, Del.—Steel Inner Tube Co., under Delaware laws, with \$500,000 capital. Corporators—A. M. Bangs, W. M. Bailey, New York City; G. G. Steigler, Wilmington, Del.

Indianapolis, Ind.—Townsend Mfg. Co.,

under Indiana laws, with \$3,000 capital; to manufacture automobile tops. Corporators—G. B. Tanner, Norman Peck, Delbert Townsend.

New York, N. Y.—Boulevard Auto Co., under New York laws, with \$20,000 capital; to manufacture motors, engines, automobiles etc. Corporators—E. N. Sorgenfrei, W. Peters, A. Korsmeier.

Chicago, Ill.—Modern Sales Bureau, under Illinois laws, with \$10,000 capital; to deal in machinery and automobile supplies. Corporators—William Goldenberg, C. Brusard, J. H. Ullmann.

Oklahoma City, Okla.—Oklahoma Motor Equipment Co., under Oklahoma laws, with \$10,000 capital. Corporators—L. E. Allmon, J. A. Carlson, Oklahoma City; M. G. Allmon, Russellville, Ky.

Newark, N. J.—T. C. M. Mfg. Co., under New Jersey laws, with \$100,000 capital; to manufacture automobiles and parts thereof. Corporators—A. Morris Thompson, Allan Coats, William McKay.

New York, N. Y.—Gus Balzer Co., under New York laws, with \$25,000 capital; to manufacture, deal in and repair motor vehicles, etc. Corporators—G. Balzer, C. S. Zimmerman, C. H. Miller.

Cincinnati, O.—Muhle-Louis Automobile Co., under Ohio laws, with \$7,500 capital; general automobile business. Corporators—J. H. Louis, H. M. Muhle, Silas B. Waters, F. J. Zumstein, Henry Smith.

Dover, Del.—Kilroy Piston Ring Co., under Delaware laws, with \$100,000 capital; to manufacture and deal in piston rings, engines and supplies. Corporators—G. F. Martin, E. J. Forham, J. J. Harper.

Toledo, O.—Toledo Regal Sales Co., under Ohio laws, with \$50,000 capital; general automobile business. Corporators—W. S. McMurray, H. J. Chittenden, A. L. Trautwein, William Rothert, Charles Rothert.

Zanesville, O.—Electric Auto Horn Co., under Ohio laws, with \$10,000 capital; to manufacture electric horns. Corporators—Julius Frank, Sam Weber, Sol Weinberg, Lou Weber, S. Lind, Morris Weinberg and others.

New York, N. Y.—Inter-State Motoring Association, under New York laws, with \$50,000 capital; general automobile business, and to build and operate garages. Corporators—T. W. Rollins, M. Turner, H. O. Carriere.

Memphis, Tenn.—P. D. Q. Co., under Tennessee laws, with \$6,000 capital; general automobile business. Corporators—Chauncey R. Benefield, Robert T. Lamb, Gordon Frierson, Ernest S. Bell, William A. Percy.

Gloversville, N. Y.—Timetest Supply Co., under New York laws, with \$100,000 capital; to deal in automobile supplies and supply time tests to automobile owners. Corporators—J. H. Stockamore, T. Robinson and D. D. Lake.

Buffalo, N. Y.—Professional Chauffeurs

Club of Buffalo, under New York laws, no capital, for social and technical purposes. Corporators—Harry Finch, William C. Oliver, Harry Hughes, Edward M. Doody, Albert O. Zimmerman.

New York, N. Y.—Electric Omnibus & Truck Co., under New York laws, with \$100,000 capital; to manufacture electric omnibuses, trucks, etc. Corporators—C. R. Field, J. B. Daniels, Brooklyn; W. B. Barker, New Rochelle, N. Y.

Syracuse, N. Y.—Syracuse Auto School, under New York laws, with \$10,000 capital; to teach automobile driving, repairing, selling, etc.; to manufacture and deal in all kinds of vehicles. Corporators—George C. Davey, Vera and J. J. Fuerth.

St. Paul, Minn.—Schurmeier Motor Car Co., under Minnesota laws, with \$200,000 capital; to manufacture automobiles. Corporators—H. H. Bigelow, E. H. Cutter, Eli S. Warner, J. E. Burkhard, Joseph McKibbin, Fred C. Whitney and O. A. Robertson.

New York, N. Y.—Gyrex Mfg. Co., under New York laws, with \$25,000 capital; to manufacture and deal in engines, motors, automobiles, etc. Corporators—E. H. Stickels, Edgewater, N. J.; C. A. Wardle, New York City; H. W. Webb, Cresskill, N. Y.

Port Richmond, N. Y.—Admiralty Power Co., under New York laws, with \$80,000 capital; to manufacture and sell motors, engines, automobiles, etc. Corporators—C. L. Straub, Plainfield, N. J.; J. H. Davidson, West New Brighton, S. I.; G. H. Bates, Cranford, N. J.

New York, N. Y.—Triplex Engineering Corporation, under New York laws, with \$25,000 capital; to manufacture and repair motors, engines, machinery, etc., both electrical and mechanical. Corporators—C. and E. A. Bechtold, Elmhurst, L. I.; A. H. Bogue, Bronxville, N. Y.

Chicago, Ill.—Drexel Automobile Co., changes name to Drexel Garage, Inc.; Hearne-Marden Motor Co., changes name to Hearne Motor Co.; Lozier Sales Co., under Illinois laws, with \$100,000 capital; general automobile business. Corporators—James Levy, F. C. Gillette and E. H. Garrett.

## Increases in Capitalization.

Hartford, Conn.—Bush Mfg. Co., from \$25,000 to \$50,000.

Indianapolis, Ind.—Delaware Garage Co., from \$5,000 to \$10,000.

Columbus, O.—Barndt & Johnson Auto Supply Co., to \$150,000.

Detroit, Mich.—Hupp Motor Car Co., from \$50,000 to \$250,000.

Dayton, O.—Speedwell Motor Car Co., from \$250,000 to \$350,000.

Muncie, Ind.—Wolf Automobile Co., decreased from \$10,000 to \$1,000.

Chicago, Ill.—Automobile Owners Association, from \$2,500 to \$100,000; directors increased from three to five.

# The easiest-riding Car in the World

IS THE

# WHITE STEAM CAR

The White Steam Car has many desirable qualities which are not equalled in any other type of car. At all times and under all conditions it is noiseless, absolutely free from vibration, smokeless and odorless. It is easiest on tires. It has unequalled hill-climbing ability. The engine can never be "stalled." It is by far the easiest car to control and it is, therefore, the safest car for passengers as well as for other users of the highway. Either kerosene or gasoline may be used as fuel.

The development of the White Steam Car—the perfection of details, simplification of parts, etc.—has gone on steadily from year to year. As a result, the 1910 White Steamer represents as great an advance over the steam car of a few years ago, as does the 1910 White Gasoline Car compared with gasoline cars designed several years ago.

During the last nine months—from July 1st to date—more White Steamers have been made and delivered to customers than in the corresponding period of any previous year.

---

Are you familiar with the many desirable features of the 1910 White Steam Car? A postal to us brings a copy of our catalog.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, MARCH 31, 1910.

#### The Answer to a Famous Question.

The treasurer and general counsel of the Automobile Legal Association is angry—so angry that he has ordered the cancellation of his subscription for the Motor World. The Massachusetts gentleman took umbrage at the Motor World's statement that the chief purpose of his "association" was to promote "pickings" for lawyers, hence his wrath. He does not dispute the truth of the statement and, in fact, could not do so if he would, as it does not admit of dispute.

The Motor World has no special desire to ruffle the feelings of anyone, but if stating exact facts gives cause for such ruffling we fear it must continue. For there is real need of plain speaking regarding the increasing number of so-called "associations," "leagues" and "clubs" which have attached themselves to the automobile body, so to speak, and which are but thinly-disguised and wholly, or almost wholly, commercial

corporations, partnerships, agencies or institutions composed of or revolving around one or two shrewd men who are reaching out for some of that "easy money" with which motorists popularly are supposed to be overburdened.

Of course, there is nothing legally wrong in appropriating the terms "association," "league," etc., for such uses, but there is small question that a law forbidding it would serve most excellent purposes, as it is safe to assert that the average person believes that organizations employing such designations represent public spirited movements; and it is more than a fair guess that this state of public mind influenced the promoters of most of the commercial enterprises in selecting the titles for their ventures. "Association," "league" and "club" suggest objects at variance with those suggested by "company," "corporation" and "agency," which latter would be the more fitting designations.

Massachusetts lawyers were first to discern the gratuitous advertising and other benefits obtainable from the employment of the public-spirited designations for subscription agency work and to those in the know nothing has been more amusing than the competition between three rival lawyers or sets of lawyers in Boston, each with a high-sounding "association" of his or their own. The "going" was so good that they all seem to have netted a snug income not only from their "members," who really are subscribers, but from the "appointment" of "official hotels" and the like; for how hotels and garages do love to display "official" signs! They seem to think them worth the price, and if proprietary "associations" and "leagues" continue to multiply there may not be enough hotels and garages to go around.

The more ambitious of these Massachusetts attorneys recently has changed the title of his venture so that it now appears to be of national scope, and only those who are well informed will henceforth be able to distinguish it from the "real thing," the American Automobile Association. It has adopted every purpose, save one, of the A. A. A., and the latter organization cannot well fail to be confused and confounded, yet the attorney in question stands fairly high in A. A. A. councils, while other A. A. A. officials have loaned either their names or their persons to this or kindred enterprises. It is one of the remarkable features of the interesting situation and suggests that the

A. A. A. is not as useful to its members as it ought to be. It ought to be able to do all that is done by these quondam "associations" and "leagues" and it should not stop short of doing so; their existence is a reflection on its usefulness.

Of course, Massachusetts has no monopoly on enterprises of this character, for New York has its own one-man Touring Club of America and its own one-man Motor Contest Association, not to mention the redolent International Automobile League; and within the last few weeks the title of the defunct American Motor League has been picked up and incorporated by a couple of up-Staters who have something to sell, possibly "official" signs among other things.

If the gentleman who first propounded that famous question, What's in a name? were alive today he would not have to seek far for the answer.

#### Furthering Electric Lighting.

After a period of incubation which was prolonged to an astonishing degree, considering its real merits, the electric lighting system for automobile use suddenly has developed to large and encouraging proportions. With it arises an important though by no means serious problem as to the most satisfactory way of supplying the necessary current. The mechanical generator, both of the dynamo and magneto types, has been evolved to a satisfactory degree and offers successful service, but at the cost of adding something to the mechanism of the car as well as increasing the first cost of its equipment to some extent. The small accumulator, on the other hand, already quite extensively employed on cars of the better order as a standby for ignition purposes, affords a satisfactory and inexpensive source of current, but at the expense of dependence upon suitably equipped charging stations. Granted a satisfactory solution of the battery charging problem, it would seem that the cause of the accumulator and of the electric light would be advanced considerably.

In this connection an apt suggestion is furnished by the kindred project of gas lighting for cars. Despite the success attained with the small acetylene generator, the use of tanks charged with compressed gas has assumed enormous proportions through the simple expedient of exchanging empty tanks for freshly charged ones at small cost to the consumer. Already one

manufacturer of accumulators has applied the same idea to the battery field, and there is no apparent reason why the plan should not be adopted universally. Charging boards may be installed in garages and repair shops at small cost to the dealer and the exchange of charged batteries for exhausted ones can be made at sufficient advance over the cost of current to allow abundantly for maintenance and dealers' profits. As a matter of fact, a large proportion of the garages both in town and country already are equipped for charging batteries, so that the most important requirement would be that of arranging and installing a suitable system on a rational basis of exchange. The scheme appears to possess useful possibilities for development. Furthermore, the difficulties which is presents are not those of electrical or mechanical obstacles, but of pure business administration, which is something more tangible if not always easy of achievement.

#### New Possibilities in Inertia.

The usually grave and sometimes learned Horseless Age has been moved to a consideration of the causes which sometimes occasion the inside wheels of a car to rise when the machine is rounding a turn at high speed. Incidentally our neighbor has stumbled upon what looks like a valuable discovery, and prints a photograph in support of it. It is that in gaining momentum a moving car loses its inertia, but that when the power is shut off inertia again rises victorious and overcoming the momentum brings the car to rest.

If this principle applies to all moving bodies, it may be that the long-sought germ of perpetual motion has been unearthed. All that is necessary is to discover some way of preventing inertia from being found again after it is lost, when the momentum would become an all-sufficient propelling agent, competent to replace steam and gas engines, electric motors, and probably clock springs as well. Of course, such a discovery, if pushed to its ultimate conclusion, would work the undoing of such portion of the mechanical world as now is engaged in the manufacture of what commonly are known as "prime movers," but it is reasonable to suppose that this achievement will be a matter of prolonged evolution. That the automobile in skidding around a corner furnishes a key to the mystery, however, seems evident to the Sage of Murray street, who avers that at such

times the force of inertia "is suddenly shattered."

"In running on a straightaway a car gains momentum in proportion to its speed," as the Sage correctly states. But, it further asserts that "it also loses what is known as inertia; that is, were the power suddenly shut off, the car would continue to travel in the direction in which it was going until its momentum was overcome by inertia, when it would come to a standstill." Apparently discriminating between science and Murray street theory, the Oracle proceeds, "In science inertia is also that quality which impels a moving object to continue its line of motion when the mechanical impetus is removed. In the case of an automobile rounding a turn" (note that this is gingerly regarded as a specific case distinct from other moving objects) "the power is not shut off, but the force of inertia, which tends to keep the car traveling in one direction is suddenly shattered. The impetus given by the motor compels the car to continue its motion around the turn, but in overcoming the force of inertia the car tips."

In the terms of antique science, of course, inertia is denominated an inherent property of all matter, neither gaining nor losing in quantity with changes in velocity; and far from being a transitional force, is, or was, regarded as a definite attribute proportional to the mass of the body. In that sense, no power on earth could "shatter" inertia, nor could momentum, which as long ago as the first of last week used to be considered a physical expression for or effect of inertia, either be "overcome by inertia" or increase in proportion to a loss of inertia.

Some three or four years ago when the question was still being discussed now and then, it used to be explained that the inside wheels occasionally rose on a turn because the car was inclined to skid and because in skidding, either the wheels encountered an obstacle, such as a rut—or possibly a gravel pile, such as the Horseless Age shows in illustrating its discovery. The skidding force, of course, was accounted for by the principle of inertia as expressed in terms of momentum or energy of motion. On this hypothesis, it is easy to explain why it is that the inside wheels do not always rise, but only when a car which is improperly balanced exceeds a certain safe limit of speed, or when through heavy traction or the influence of a gravel pile, the outside wheels refuse to skid.

### COMING EVENTS

March 26-April 2, Montreal, Can.—Fourth National Automobile and Sportsmen's show.

March 26-April 2, Pittsburg, Pa.—Pittsburg Automobile Dealers Association's fourth annual show in Duquesne Garden.

March 28-April 2, Indianapolis, Ind.—Indianapolis Automobile Trade Association's first annual show in individual show rooms.

March 28-29, Savannah, Ga.—Savannah Automobile Club's 675 miles endurance run to Jacksonville, Fla.

March 28-April 2, Toledo, O.—Toledo automobile dealers' individual shows in sales rooms.

March 29-April 2, Rockford, Ill.—Rockford Motorist Association's first annual automobile show in Coliseum.

April 5-6, Amarillo, Tex.—Amarillo Automobile Association's race meeting.

April 6-9, Duluth, Minn.—Duluth and Superior Automobile Club's first annual automobile show in state armory.

April 7-9, Logansport, Ind.—Second annual automobile show in Broadway garage.

April 8-17, Los Angeles, Cal.—Inaugural meet on the new Los Angeles Motordrome.

April 9-16, Elmira, N. Y.—Elmira Chamber of Commerce's first annual automobile show.

April 11-16, Harrisburg, Pa.—First automobile show.

April 11-18, Springfield, Mo.—Springfield Chamber of Commerce's first automobile show.

April 18-23, Bangor, Me.—Second annual automobile show in Auditorium.

April 30-May 1, 2, Philadelphia, Pa.—Quaker City Motor Club's roadability run.

May 2, Denver, Colo.—Start of Flag-to-Flag endurance and reliability contest to City of Mexico for Wahlgreen trophy.

May 5-7, Atlanta, Ga.—Opening spring race meeting on Atlanta motordrome.

May 9-14, Harrisburg, Pa.—Motor Club of Harrisburg's fourth annual reliability contest.

May 18-19, Norristown, Pa.—Norristown Automobile Club's third annual endurance run to Scranton and return.

June 11, Wilkes-Barre, Pa.—Wilkes-Barre Automobile Club's annual hill climb on Giant's Despair.

July 2, Wildwood, N. J.—North Wildwood Automobile Club's roadability run from Philadelphia to Wildwood.

July 4, Wildwood, N. J.—North Wildwood Automobile Club's annual beach races meet on Ocean drive.

**GOOD SPORT AT ATLANTA CLIMB**

**Almand Cinches Journal Trophy—Seven Events Provide Warm Competition—Timing Apparatus Goes Wrong.**

Viewed by an enthusiastic crowd of some 3,000 persons, the fourth annual hill climb promoted by the Fulton County Automobile Association, of Atlanta, Ga., was held on

in 3:43. Miller, the driver, did not expect to win, but some fellow agents had bet him that he dare not show up at the climb and that if he started he would never get to the top. Miller won his bet easily. The winner was yet to come, however, and he turned up in C. F. Wolf, who guided his Krit car to the summit in 1:25.

The class for cars costing between \$801 and \$1,200 brought out a larger field of starters, and J. E. Darby, piloting a War-

uct brought the natives cause for rejoicing. The car was the White Star, driven by Charles Jones in 1:15 $\frac{3}{4}$ , while Parmalee's Buick was timed in 1:18 $\frac{3}{4}$ . Schultz, in a Parry, was third, in 1:28 $\frac{3}{4}$ . The best time was made by H. L. Cohen in an E. M. F., but he was disqualified for being without a dustpan, the car having been borrowed from a local owner a few hours before the contest. His time was three-fifths of a second better than was made by Jones in the White Star.

The first driver to score under a minute was William Oldknow, when he swept up the hill in 57 $\frac{3}{4}$  seconds, in the event for cars between \$1,601 and \$2,000. L. E. Pain followed in 1:02 and P. O. Parmalee was third in 1:03 $\frac{3}{4}$ , which was close enough competition to be exciting. All three drove Buicks, they with the exception of two other cars being the only makes in the event.

In the fifth event—for cars between \$2,001 and \$3,000—W. J. Stoddard in a National whizzed to the top in 58 seconds flat, and later in the day cut this time nearly three seconds, when he stripped the car for the free-for-all event. L. W. LaBlanche was second, in the Knox, and Walter T. Candler, third; the last named piloted a Marmon.

As there were only two contestants in the class calling for cars of \$4,000 and upwards, the event resolved into a duel, but it was an exciting one, with C. C. Rooney, Packard, and Walter L. Dunn, Stearns, as the duellists. Dunn was the first up, and he attained the summit in 1:05 $\frac{3}{4}$ . The time was megaphoned down and Rooney smiled as

C. F. WOLF FINISHING IN HIS WINNING KRIT

Saturday afternoon last, 26th inst., on the Stewart avenue hill, near that city. There was not an accident to mar the sport, and only one disqualification, so that the promoters were well pleased with the outcome.

The feature of the afternoon was the driving of A. R. Almand in the free-for-all when he buzzed up the long incline in 47 $\frac{3}{4}$  seconds in E. H. Inman's 90-horsepower Simplex car, winning for the third time the Atlanta Journal trophy, and thereby securing permanent possession of it. In former years he had won it with a Stearns.

The crowd began to arrive at the hill long before the scheduled time for the climb, by trolley, on foot and in automobiles, while even a few dared to appear at the course in archaic horse-drawn vehicles. Everyone brought his lunch, and as it was a hot and dusty afternoon the pop boys made plenty of profit. Just before the time for the first event to be called the timing apparatus, which had been working splendidly all morning, took a notion to go out of commission, and finally the timers had to fall back upon the old-style method of timing by telephone, which anyway is nearly accurate.

The first contestant to get the word was K. T. McKinstry, at the wheel of the little Hupmobile, and he went to the top in business-like fashion in 1:31. The Metz—the tiniest of all the babies—was the next up,

SOME OF THE OFFICIALS AT THE ATLANTA HILL CLIMB

ren-Detroit, made the first trial. His time was 1:15 $\frac{3}{4}$ , while M. Venable, who followed in the Ford, required nearly four seconds longer. L. E. Fain, in a Buick, was the ultimate winner, the watches giving him 1:07.

In the next event, for cars listing between \$1,201 and \$1,600, the victory of a local prod-

he threw in the clutch and let drive. There was a buzz of excitement when it was announced that he had covered the course in 1:04 $\frac{3}{4}$ , winning the event.

With only one event remaining on the program—that was the free-for-all—the 22 policemen under the command of Chief

Rowan pushed are crowd further back along the sides of the road.

As the free-for-all trophy had been won twice by Inman's cars, it goes without saying that the crowd was interested to see if he would gain permanent possession of it. John Toole was the first up, in his Knox, and made a very creditable showing in 50 $\frac{3}{4}$  seconds, the fastest time that so far had been made. Almand then steered a Pope-Hartford in 1:03 $\frac{1}{2}$ , and was followed by Stoddard in his National, which had been divested of its body. His time was announced as 55 $\frac{3}{4}$  seconds, and there remained only the Inman Simplex, which Almand had been elected to drive. As soon as he got the word Almand was off with a rush and a roar and a whirl of dust. It seemed less than a minute before the word came to the watchers at the bottom of the hill that Almand had won the trophy, his time being 47 $\frac{3}{4}$  seconds, which was exactly two seconds slower than the record for the course, made last year by Lambert in a White car. The summaries follow:

#### Cars Costing \$800 and Under.

- 1 C. F. Wolf, Krit ..... 1:25
- 2 K. T. McKinstry, Hupmobile ..... 1:31
- 3 D. R. Miller, Metz ..... 3:43

#### Cars Costing \$801 to \$1,200.

- 1 L. E. Fain, Buick ..... 1:07
- 2 J. E. Darby, Warren-Detroit ..... 1:15 $\frac{3}{4}$
- 3 M. V. Venable, Ford ..... 1:19
- 4 R. C. Howard, Mitchell ..... 1:25 $\frac{3}{4}$
- 5 George F. Hardy, Cameron ..... 1:31
- 6 J. B. Wall, Cameron ..... 2:16

#### Cars Costing \$1,201 to \$1,600.

- 1 Charles E. Jones, White Star ..... 1:15 $\frac{3}{4}$
- 2 P. O. Parmalee, Buick ..... 1:18 $\frac{3}{4}$
- 3 Percy C. Schultz, Parry ..... 1:28 $\frac{3}{4}$
- H. L. Cohen, E-M-F ..... 1:15\*

#### Cars Costing \$1,600 to \$2,000.

- 1 William Oldknow, Buick ..... 0:57 $\frac{3}{4}$
- 2 L. E. Fain, Buick ..... 1:02
- 3 P. O. Parmalee, Buick ..... 1:03 $\frac{3}{4}$
- 4 R. T. Peckham, Pullman ..... 1:13

#### Altadena Hill Climb Again Postponed.

There is a possibility that the headliner on the Southern California motor calendar, the annual Pasadena-Altadena hill climb, will go by the boards this year at least, for it has been postponed again, this time until some time in April, not yet definitely fixed. It was last set for the 19th inst., and before that for February 22d.

## "CORSET CUP" REMAINS UNWON

### Rain Falls in Florida and Prevents the Race for It—Concluding Events of the "Sandfest."

Rain marred the final day of the three days beach carnival at Daytona, Fla., on Thursday, 24th, and in addition to precluding the breaking of any records on account of the unfit condition of the beach, also necessitated the calling off of the star number on the card—the 100 miles race for the \$5,000 "Corset Cup" offered by the makers of the W. B. straitjacket—after the distance previously had been cut from 300 miles. Barney Oldfield and his Benz were the star performers on the final day, and although he did not slice any more records, he came pretty close to it.

Before the rain fell, which caused a postponement of the races for over an hour, Oldfield spun a mile in 27.88, as against his record of 27.33 made the previous week. Considering the unfavorable conditions this time was remarkable, and was unapproached by any of the other drivers.

As usual, the Christie freak misbehaved and George Robertson gave up after two unsuccessful attempts to get results. Then Christie himself took a try, and with a couple of hundred pounds of ice serving as a cooling medium instead of the conventional radiator, which was removed because it failed to function properly, the inventor managed to register a mile in 33.15. Ben Kirscher, with an old Vanderbilt Darracq, was timed for a mile in 37.24.

There were three other numbers on the card for the last day, and all proved interesting to the 12,000 spectators who were present, although they were much disappointed at the failure to see records broken and the shortening of the program. M. B. Aultman, in a Hudson, captured the ten miles handicap from the limit mark (5:10), in 12:45.98. Oldfield, Knox (0:30), was second, and Kirscher, Darracq (scratch), third. Another similar event at the same distance went to Kirscher, who drove from scratch in 7:21:00. Oldfield with the Knox was the runner up from the (0:30) mark, and R. M. Bond, Stearns (1:25) came in third. In a ten miles match between Aultman, Hudson, and Peter Hart, Buick, the latter won. Time, 12:58. The world's records made by Oldfield and his Benz which was shod with American tires—Firestone—have been accepted by the A. A. A. and are as follows: 1 mile, flying start, 0:27.33; 1 mile, standing start, 0:40.53; 1 kilometer, flying start, 0:17.94; 2 miles flying start, 0:55.87.

#### The summaries:

One mile against time, flying start—Won by Oldfield, Benz, 0:27.88; Christie, Christie, 0:33.15; Kirscher, Darracq, 0:37.24.

Ten miles handicap, free-for-all—Won by M. B. Aultman, Hudson (5:10); second,

Oldfield, Knox (0:30); third, Kirscher, Darracq (scratch). Time, 12:45.98. W. E. Davis, Chalmers (3:30), and R. M. Bond, Stearns (1:25), also ran.

Ten miles handicap, free-for-all—Won by Kirscher, Darracq (scratch); second, Oldfield, Knox (0:30); third, R. M. Bond, Stearns (1:25). Time, 7:21. W. E. Davis, Chalmers (3:30), and M. B. Aultman, Hudson (5:10), also started.

Ten miles match between M. B. Aultman, Hudson, and Peter Hart, Buick—Won by Hart. Time, 12:58.

#### The Morgan Association Stirs Himself.

The Motor Contest Association whose other name is W. J. Morgan, has shaken off his winter lethargy and is preparing to run a pruning knife over the new A. A. A. contest rules for weak spots through the medium of a two days reliability contest from New York to Atlantic City and return on May 10 and 11. It will replace the unmentioned three days circumnavigation of New Jersey which another one-man organization fathered last year, but does not by any means represent the extent of his activities for the coming season, for he also has "in the works" a three days tour around Long Island, and a second staging of another of his loves, the Riverhead road race, notwithstanding the fact that its initial running last year did not leave the Motor Contest Association funds enough to buy gasoline to return from the course.

#### A. A. A. Establishes Championships.

Although there are official championship races in every other form of sport, they have until now been lacking in the automobile field. The deficiency will be supplied, however, the Contest Board of the American Automobile Association having announced that it will hold a national championship meeting at the Indianapolis Motor Speedway, May 30th, following a circuit meet to be held on that track May 27 and 28. The championships will consist of about 15 events for all classes of stock cars, each class competing at both the 5 and 10 miles distances. The prizes will be gold, silver and bronze medals for the first three finishers in each event. The meeting will be under the direction of the Contest Board, to whom entries must be made.

#### Chicago Club's New Gasolene System.

In the hope of making its garage a paying proposition, the Chicago Automobile Club has instructed its garage men to fill the gasolene tank of each car every time it comes in, whether or not any fuel is needed. By this compulsory stimulation of the sale of "gas" the club hopes to convert the annual deficit in the maintenance of the establishment into a profitable venture. The Chicago organization borrowed the idea from the Automobile Club of America, which is said to derive an annual revenue of \$20,000 from the fill-'em-up policy, which is said to have originated there.

**SHOW TRIO WIDELY SEPARATED**

**Pittsburg, Montreal and Spokane Stage Impressive Displays—Wide Range of Cars Placed on View.**

Three more cities had their annual automobile shows last week, including Pittsburg, Pa., Montreal, Can., and Spokane, Wash., the Smoky City staging the largest and most attractive display in Duquesne Garden. The Canadian exhibition was a mixed affair, consisting of automobiles, motorboats, aeroplanes and sportsmen's paraphernalia, and was held in the Coliseum. In far-off Spokane the local dealers held their first show in the Princess Rink and made a very good display.

At dusk on Saturday, 26th, the turnstiles of Duquesne Garden were unlocked and the lights turned on, and with these simple ceremonies the fourth annual automobile show of the Pittsburg Automobile Dealers' Association was inaugurated for its usual term of a week. In size and character of exhibits, in brilliancy and splendor, and in attendance this year's effort eclipsed all of its predecessors.

Assembled in the largest building of which the steel town boasts were over 200 cars representing the products of 65 makers, while 100 accessory firms displayed their wares. Shown for the first time was the Lange truck, made by the Lange Wagon Co., of Pittsburg, while the Pittsburg Six, which also is a native product, although not a new one, made its first appearance this year on the show circuit. In the accessory division the large number of Pittsburg firms who produce sundries of one sort or another was quite noticeable.

There was no economy or rehashing of decorations this year, and the scenic fixings all were fresh and new. Suspended from the centre of the ceiling were long streamers of canary and yellow bunting which trailed to the side walls. These also were similarly attired, and yellow pennants floated from the hoods of the cars. With the exception of the green carpet, everything else in the setting was saffron hued. Hanging from the ceiling were long yellow ropes, from the ends of which dangled potted plants, and each exhibit exuded the fragrant odor of cut flowers. The open windows admitted a gentle breeze which distributed the perfume throughout the building, and caused the hanging plants to sway gently to and fro. Lighting was on an equally gorgeous scale as the decorations, and so numerous and brilliant were the gleaming globes that every semblance of shadow was dispelled by the flood of illumination. Five huge electric domes hung from the roof, and 200 small bronze and art glass domes, filled with miniature lamps, were apportioned among the exhibitors.

On the opening night 5,000 people wended

their way to the garden, and the total attendance indicated a daily repetition of the figures on the first day. Following the fashion of the season in show novelties, a Curtiss aeroplane was provided and dangled from the ceiling, where it received its share of attention. Replacing the string band of last year was the Empire Women's orchestra of 53 pieces, of Boston, and which did similar service at the Hub exhibition.

Following are the exhibitors:

Gasolene cars—Forbes Motor Car Co., Krit and Abbott-Detroit; Anderson Auto Co., Atlas; Urling & Co., Autocar and Corbin; Buhl & McCulla, Brush; Buick Motor Co., Buick; Pioneer Motor Car Co., Chalmers, Hudson, Locomobile; Maxwell-Briscoe Co., Columbia and Maxwell; Keystone Auto Co., Courier, Marmon, Rapid, Overland and Stoddard-Dayton; F. W. Fisher, Croxton-Keeton; A. G. Wilkinsburg Co., Elmore; Pittsburg Auto Co., E-M-F., Flanders, Thomas; Ford Motor Co., Ford; Franklin Auto Co., Franklin; Liberty Auto Co., Hupmobile and Regal; Inter-State Sales Agency, Inter-State; Arlington Motor Car Co., Jackson; Kline Kar Motor Co., Klinekar; Hiland Auto Co., Knox, Peerless; Pittsburg-Mitchell Co., Mitchell; Harvey Motor Car Co., Enger; Larimer & Lowry, Auburn; Pittsburg Speedway Motor Co., National; Vestal Motor Car Co., Otto and Stevens-Duryea; W. C. De Forest & Son, Parry; East End Auto Co., Paterson and Pope-Hartford; Standard Auto Co., Packard; McCurdy-May Co., Pierce-Arrow; Pittsburg Motor Car Co., Pittsburg Six; Premier Sales Co., Ltd., Premier and Reo; Pullman Motor Car Co., Pullman; Martin & Mars, Rambler; McAllister Bros. Motor Car Co., Cadillac; H. Lange Wagon Co., Lange trucks; Sebring Motor Car Co., Sebring; Speedwell Motor Co., Speedwell; Mutual Motor Car Co., Stearns; Studebaker Auto Co., Studebaker; The White Co., White; Whiting Sales Agency, Whiting; Winton Motor Carriage Co., Winton.

Electric vehicles—A. G. Wilkinsburg Co., Baker; Mutual Motor Car Co., Rauch & Lang; Studebaker Auto Co., Studebaker; East End Auto Co., Waverley; Hiland Auto Co., Woods; Keystone Automobile Co., Columbus.

Steam cars—The White Co., White.

Accessories—Petroleum Products Co., Wishart & McGowan, Pittsburg Rubber Co., James L. Gibney & Bro., Pittsburg Reinforced Brazing & Machine Co., E. J. Thompson Co., Automobile Accessories Co., Knapp-Greenwood Co., Pittsburg Auto Equipment Co., Cowell Rubber Co., L. Glesenkamp Sons & Co.

Preceded by a parade of decorated cars in which over 200 machines participated, the first automobile show ever held in Spokane, Wash., was opened in Princess Rink on Monday, 21st, under the auspices of the local dealers. Mayor Pratt made the inaugural speech and presented the silver cup offered by the Chauffeurs' Club for the best decorated machine in the parade, to William

Snow. Twenty-seven makes of car were shown, among them being one foreign product—a Renault. Devoid of any garishness or spectacular effect, the decorations were quiet and tasteful. At the entrance to the hall was an arch of American flags supported by palms, while the pillars and ceiling also were draped in the national colors. Along one side of the building was a row of boxes surrounded by white and gold pillars supporting palms connected by gilded chains. The floor was covered with green burlap and potted plants were scattered about in profusion. The attendance was very good throughout the week, and it is certain that Spokane has not held its last automobile show.

The exhibitors were the following:

Gasolene cars—Dulmage-Rose Co., Studebaker, E-M-F. and Flanders; Elmore Motor Car Co., Elmore; Ford Motor Car Co., Ford; Jackson Motor Car Co., Jackson; Metropolitan Motor Car Co., Acme, Premier, Pullman and Lozier; Northwest Auto Supply Co., Pierce-Arrow, Buick, Knox and Franklin; Nute & Keena, Packard; Overland Automobile Co., Overland and Marion; Pytcher-Tyler Co., Hupmobile, Rapid and White; J. P. Schoenberger, Palmer-Singer; Standard Motor Car Co., American, Reo, Stoddard-Dayton and Renault; Columbia Garage Co., Winton.

Steam cars—Pytcher-Tyler Co., White.

Electric vehicles—Northwest Auto Supply Co., Detroit.

Motorcycles—McDonald Supply Co., Excelsior and Thor; Spokane Cycle & Supply Co., Indian; James F. Stack, Harley-Davidson and R-S.

Transplanting the custom followed at American motor exhibitions, the fourth annual Motor and Sportsmen's Show at Montreal, Can., was opened on Saturday, 26th, by Mayor Guerin amid the tooting of horns and screeching of sirens. Held under the patronage of the Montreal Auto and Aero Club, the exhibition is the most elaborate of its kind ever held in the Canadian city, and over 100 cars, most of them of American descent, share honors with motorboats, aeroplanes, and other auxiliaries of outdoor sport.

There are on exhibition cars of 45 different makes, the product of the leading factories of the United States, Canada, England and France. Conspicuous among them is the Russell car, made in Canada and using the Silent Knight engine. Practically every accessory firm in the province is represented, and one stand, which receives a surfeit of attention, is the Michelin booth, by reason of the hilarious antics of one of the Bibendum twins.

Decorated with flags, flowers, bunting and electric effects, the interior of the immense rink presents a brilliant appearance, while the air of coziness is further enhanced by the temporary ceiling of soft white texture and the great green carpet on the floor. Along the aisles are pillars of staff connected with streamers. On the

opening night 2,000 people were on hand and indications are that these figures will constitute a daily average throughout the duration of the show, which will end this week.

The car and accessory exhibitors are the following:

Gasolene cars—Packard Motor Car Co., Packard; Lozier Motor Co., Lozier; Rapid Motor Vehicle Co., Rapid; Olds Motor Works, Oldsmobile; Maxwell-Briscoe Co., Maxwell; McLaughlin-Buick Co., Buick; Welch and Reliance; E-M-F. Co., E-M-F. and Flanders; Mitchell Motor Car Co., Mitchell; Hudson Motor Car Co., Hudson; H. H. Franklin Mfg. Co., Franklin; Knox Automobile Co., Knox; Charron Automobile Co., C. G. V.; Renault Mfg. Co., Renault; Chalmers Motor Co., Chalmers; E. R. Thomas Motor Co., Thomas; Cadillac Motor Car Co., Cadillac; Peerless Motor Car Co., Peerless; Stevens-Duryea Co., Stevens-Duryea; Canada Cycle & Motor Co., Russell; Girdwood-Stockwell Co., Ford; Reo Motor Car Co., Reo; Simplex Co., National Auto Co., Canadian Automobile Co., Metz Co., Metz; Chase Motor Truck Co., Chase.

Accessories—Hoyt Electrical Instrument Co., Ernest Flentje, John Forman, Canadian Rubber Co., Dunlop Tire Co., John Millen & Sons, Ltd., Goodyear Tire Co., Comet Motor Co., S. F. Bowser Co., Dominion Tire & Rubber Co., McCord Mfg. Co., Rubber Tire Wheel Co., Gutta Percha Mfg. Co., Michelin Tire Co., Franco-American Auto Co.

#### France Evolves a New Dustless Pavement.

Ferro-cement roads are being experimented with in France. The substance is made of cement mixed with iron straw. To make a slab or block of ferro-cement a mass of iron shavings is placed in the mould and there is poured over it a cement sufficiently liquid to penetrate into all the interstices of the iron and completely cover it. When the whole has set the core of iron thus intimately connected gives to the block a great resistance to breakage and to traction, at the same time furnishing elasticity to compression, which enables it to stand superficial shocks. A brick of ferro-cement one and three fifths inches thick, has supported during crushing tests a pressure of about sixty-five tons to the square inch. In breakage tests the resistance was quadruple that of ordinary cement. Resistance to wear was no less remarkable and of course, the pavement is dustless.

#### Fast Touring Car for Salvage Corps.

Saving as much as possible goods and merchandise in burning buildings from damage by water is to be the chief duty of the newly organized Salvage Corps, of Indianapolis, Ind. The most important part of its equipment is a fast touring car to carry tarpaulins and two members of the corps to the danger spots where their services are needed.

#### Big E-M-F. Mail Requires Private Car.

The E-M-F. Co., of Detroit, Mich., has produced its first commercial vehicle. It was not built for sale, however, but for the company's own use, and necessity was the prime mover in the case. It seems that the enormous amount of mail matter delivered at the Detroit post office for the E-M-F. Co., aggregating 143,000 pieces of first class mail during the month of February, demanded some kind of an arrangement by which such mail matter could be transferred safely and expeditiously to and from the E-M-F. general offices, the several large touring cars which were employed at times,

gine is in greater demand than ever before. Its adaptability to most conditions and its usual reliability commend it. Another feature of this year's trade is the fully equipped car. A couple of years ago the purchaser of an automobile paid the price for it and then brought the equipment extra. Now the machines are sold fully equipped with lamps, horns, etc.

"About 60 per cent. of the machines owned in Winnipeg have operated through the entire winter. This is even true of the water cooled cars. This is the first year that the automobile has been an active industry for the entire twelve months. The

PRIVATE MAIL CAR IN E-M-F. SERVICE

proving merely half-way measures, the need of a special vehicle becoming evident as soon as the spring "rush" started. Accordingly, a special wagon was built by the E-M-F. Co., upon one of its regular chassis, and now an hourly mail service is maintained between the post office and the four E-M-F. plants in Detroit. The special body of the wagon, which is shown by the accompanying illustration, is painted in the familiar colors of the regular U. S. mail wagons and vans.

#### Market Growing in Western Canada.

The great advance made by the automobile in Western Canada, recently discussed in the Motor World, is still further indicated by a report of Vice-Consul-General James J. McBride, of Winnipeg, who states that, in his opinion, the year 1910 will prove a banner year for high grade machines in his part of the country. Orders for 925 machines, valued at \$1,640,000, are reported to be in hand for delivery before June, and the dealers are in doubt as to their ability to supply the demand.

"The Western Canadian market wants a good grade of machine," says the consul. "While the average price of cars will be about \$2,000, there is a good demand for the \$3,000 machine. The four-cylinder en-

gine is in greater demand than ever before. Its adaptability to most conditions and its usual reliability commend it. Another feature of this year's trade is the fully equipped car. A couple of years ago the purchaser of an automobile paid the price for it and then brought the equipment extra. Now the machines are sold fully equipped with lamps, horns, etc.

"Not only in Winnipeg is the outlook promising. Throughout the entire west orders for automobiles are reported in far greater numbers than ever before. The farmers are using gasolene farming machinery, and are beginning to realize the value of the automobile. Last year the automobile business amounted to about \$1,000,000, while the present estimates are that about double that amount will be invested in machines this year."

#### Small Cars Gain Ground in Germany.

Statistics just issued by the German government in reference to the total quantity of motor vehicles in the Empire, place the number of automobiles at 24,639, divided as follows:

		Increase since Jan. 1, 1909.
Less than 8 h.p.....	12,595	33.5%
From 8 to 16 h.p.....	7,341	34.9%
From 17 to 40 h.p.....	4,605	28.1%
Over 40 h.p.....	98	27.3%
	24,639	30.9%
Motorcycles .....	22,283	6.5%
Total motor vehicles.	46,922	19.7%

## TWO MID-SEASON MODELS APPEAR

**Jeffery & Co. Bring Out Smart Additions to the Rambler Line—Features of the Newcomers.**

All Rambler cars of present vintage being known as "New Ramblers," it becomes somewhat difficult to express briefly in words the idea that a hitherto unfamiliar augmentation to the line recently has occurred and that there are both New Ramblers and new New Ramblers. Such is the burden of an announcement which just has been made by Thomas B. Jeffery & Co., of Kenosha, Wis., however, whose decision to

member of the roadster class, possessing such conventional peculiarities as oval gasoline tank mounted behind the seat, tilted seat, together with a pronounced rake on the steering column and a trunk equipment in addition to the standard accessory fittings. The chassis, for both models, is that of 34 horsepower, which was brought out in time to be exhibited during the entire show season. It has 109-inch wheel base and tires 36 by 3½ inches.

### Motor Cars for "Wireless" Service.

The French Signal Corps recently has conducted exhaustive experiments with an automobile wireless outfit, and with marked success. The general outward appearance of the car with which the French soldiers

SMALL TONNEAU RAMBLER "MID-SEASON" MODEL

concentrate upon a single chassis model this year was signalized by the appearance of the first New Rambler car. The newcomers are known as models "Fifty-three" and "Fifty-four," and are in small tonneau and roadster form, respectively. Needless to add, the element of novelty in both machines is found above the chassis line; the running gear now is a thoroughly standardized feature common to all members of the line.

The "Fifty-four" is termed a "mid-season" model. It also is a sort of mid-sized model; for it forms a connecting link between the close-coupled and full tonneau types. Its lines suggest the close coupled car in some degree, but is a little more roomy than the ordinary car of this denomination, and therefore, probably, considerably more acceptable to certain classes of users. The advantages claimed for this model are: low seats, which are 2 inches wider than usual, measured from front to back; seat cushions tilted and seat backs raked to correspond; body smaller and lighter than that employed on the standard touring car; 3 inches increase in leg room for the driver and his companion, and a tonneau roomy enough to accommodate three passengers comfortably. The car is sold completely equipped, with lamps, Prest-O-Lite tank, generator, magneto, storage battery, horn and tools.

The model "Fifty-three" is a nobby little

NEW RAMBLER ROADSTER WITH VISIBLE TANK

worked, resembled an ordinary limousine. The mast, its base, the winch by which it is raised, all are carried on the roof and covered with tarpaulins. All sections of the body are movable to permit of rapid ingress or egress, and an easy operation of the necessary parts of the wireless outfit. The apparatus is said to have worked satisfactorily over fifteen miles. So far the French army is the only one to possess an outfit of this kind, but it is likely that before long the Signal Corps of the United States Army will have a similar apparatus. Germany and Italy already have given orders for such vehicles, and it is thought the other nations will follow soon.

## RELIEVING THE RUBBER SITUATION

**Relief not Immediately in Sight, but None the Less Certain—Expert Discusses the Conditions.**

That the present record breaking prices for crude rubber and the prices which promise to prevail during the next few months will bring about an automatic relief of the rubber situation in the future, is the prediction of an expert who is intimately in touch with the rubber situation and whose views are authoritative. The stimulation to production which the high prices will induce, he declares, will result in a radical lowering of the price within the next year or two and in five or six years will make rubber positively cheap, when compared with the figures that now prevail.

Although not venturing any opinion as to what heights rubber may attain during the coming summer, he foresees a subsequent reduction within two years which probably will bring the fine, upriver Para grade to something like \$1.65 or \$1.70 per pound, while the succeeding four or five years, in his opinion, should further reduce the price to something like \$1 per pound.

Many influences are working toward the reduction of rubber prices, he says, and in combination they will exert an effect which

will serve to greatly increase the supply and lower the cost of the crude material. In Brazil itself, where the Para rubber comes from, two new railroads are being extended to points where they penetrate the rubber district, and they will afford a means of solving in a large measure the difficult transportation problems which heretofore had restricted the shipments to the outside world. There are hundreds of thousands of acres of rubber trees in the Para district which as yet are untouched because of their inaccessibility, but this latter condition is being overcome not only by railway extension, but by other means as well.

Low water in the upper part of the Ama-

## THE MOTOR WORLD

zon river long has presented a troublesome obstacle to navigation by the steamers which have been depended upon to convey the crude rubber down to the seaboard, but light draft motor boats now are being introduced with great success. These are able to make their way far beyond the range available to the steamers and their return trips down to the seacoast shipping points can be made without interruption despite low water conditions which paralyze steam navigation in the upper river.

As a rival to the finest Para rubber there is the rapidly increasing output of plantation rubber, the best grades of which are almost identical in character with the Para product. Ceylon is to the forefront in the marketing of this rubber, being one of the

### MARMON BUILT FOR SPEED WORK

**Indianapolis Manufacturers Produce a Wind-splitting Model—Skin Friction Also Considered in the Design.**

Under the new racing rules of the American Automobile Association, manufacturers who desire to depart from the limitations imposed by the revised stock car definition are given opportunity to enter a special class which has been established on a piston displacement basis, but otherwise free from restrictions. The first of the makers to construct a car especially for racing purposes since the new rules went into effect is the

will travel no less than 40 miles an hour faster than the regular stock car of the same power but carrying the conventional body.

As already intimated, the general construction of the power plant is not radically different from that of the Marmon stock product. One noticeable departure, however, is found in the wheels, which are of the disc type, and therefore supposed to exert less disturbance in the air than the spoked type such as are more commonly used.

#### Denmark a Promising Market.

Little has been heard heretofore about the activities of American automobile manufacturers in Denmark, but from a report by

NEW MARMON SPECIAL RACER, SHOWING DISC WHEELS

FRONT VIEW OF RACER

first districts to take up artificial cultivation of rubber on a big scale, and its offerings now constitute an important and increasingly large element in the market. Immense plantations are in cultivation and are being started in nearly all countries where conditions are suitable, and these will help swell the volume of raw rubber that will be put on the market in the future in competition with that from Para.

These factors will have their effect in restoring normal conditions.

#### Hand Pumps that Prove Useful.

Commercial vehicle operators whose machines are equipped with high placed and semi-accessible radiator filler openings should provide themselves with small hand force pumps of the sort which are marketed in the country for carriage washing purposes. Their use will permit the radiator to be filled readily when a hose is not at hand, and will prove valuable in reducing roadside delays.

#### Care Necessary in Using Anti-Carbon.

When using any of the carbon removing compounds which are marketed for use inside the cylinders, care should be taken to see that none of the liquid is spilled on painted or varnished surfaces. Its effectiveness in removing such surfacing materials is marvelously effective and almost instantaneous.

Nordyke & Marmon Co., of Indianapolis, which has just completed a weird-looking vehicle which, owing to its peculiar abdominal formation, has been dubbed the "Wasp."

By the terms of the new rules, Class "C" is open to "any gasoline car or chassis made by a factory which has during the twelve months prior to the date of contest produced at least 50 motor cars (not necessarily of the same model)." Eligibility is further governed by piston displacement limitations, which are the same as those for stock chassis entered under the limited weight clause. The new Marmon racer is designed to be entered in Class "5," which calls for piston displacements of between 451 and 600 cubic inches. The engine is of six-cylinder construction and the machine complete weighs close to 2,200 pounds.

In accordance with the ideas of Howard C. Marmon, its designer, the bodywork has been laid out with special reference to the reduction of windage to the lowest possible minimum. The wedge-shaped prow and long, pointed stern are clearly shown in the accompanying pictures, which also reveal the smooth and unbroken surface which is carried out at the sides in order to decrease the skin friction—which small factor it was thought might exert a sensible retarding influence on the progress of the car. In this connection Mr. Marmon is quoted as expressing the belief that the new car

Consul-General Wallace C. Bond, of Copenhagen, it appears that not only are American motor cars very much in evidence there but that they are gaining in popularity. There is but one automobile factory in Denmark, and this produces only delivery cars. All pleasure vehicles are imported from the United States, England and Germany, and the American prices are such that they are proving strong competitors of the other countries.

"The low priced car is likely to prove the best seller here," says the consul in his report, "as the average income in Denmark, especially among the middle class, is much lower than in the United States. A limited market could doubtless be found for some high class cars of 50 to 80 horsepower, with more or less luxurious equipment. Motor cars for delivery purposes are gradually replacing the horse-drawn wagon, and the demand will increase for some time. The manufacturer with the right price will undoubtedly do a profitable business here."

#### Why Battery Wiring Requires Attention.

Where batteries are used only at rare intervals and mainly for starting the motor, it is well to go over the primary wiring occasionally to make sure that there is no leakage of current. Otherwise, the supply may be found inadequate just when it is most required for emergency purposes.

**EMBODIES ADVANCED CONSTRUCTION**

**Owen Car Discloses a Radical Product of Improved Practice—Center Control and Long Stroke Motor.**

Few of the new productions which are flooding the market in such overwhelming quantities at the present time, can lay claim to more novel and advanced features than the Owen, which is an essentially high grade machine, as well as a promising one. Among its unusual features may be noted the use of large wheels, a long stroke motor, left hand driving position with right hand lever control, low center of gravity,

OWEN 50 HORSEPOWER TOURING CAR WITH LEFT HAND CONTROL

closed front, straight line—otherwise torpedo—body, and a most complete touring equipment. The method of arranging the controlling devices in particular is of interest. The gear shifting lever is mounted on the gear case by a ball and socket device, and is placed far enough forward on the foot board to permit the driver to pass across the car if necessary, without inconvenience. The braking equipment is entirely operated by pedal means. The emergency equipment, which acts through a beam equalizer on bands expanding into drums on the rear wheels, is held by a ratchet device, which is actuated by means of a rocking toe pad. The service brakes, which also are applied to the rear wheels, are actuated by the clutch pedal, when it is pushed to the limit of its travel.

The motor has the unusual cylinder dimensions of  $4\frac{3}{4}$  inches bore and 6 inches stroke. By the A. L. A. M. formula, this would yield a rating of only  $30\frac{5}{8}$  horsepower. The maker's rating for the motor, however, is 50 horsepower, which is readily accounted for by the great relative length of stroke. The cylinders are cast in pairs in "L" form, with the valves mounted on the right hand side. This provides ample space on the left for the steering gear, which is placed well forward in order to allow a good and sufficient rake to the steering column.

The magneto is the only independent auxiliary which is carried on the left side of the motor. The centrifugal water pump, which also is on that side of the machine, is housed within the gear casing in front. All engine gears are spiral cut, and the valve actuating mechanism employs roller lifts. Self-contained constant level engine lubrication, Bosch dual ignition with separate switches controlling the individual plugs, long, four-bolt connecting rods, long pistons and "mechanically expanded" white brass bearings, are other features of merit about the engine.

The master clutch is of the leather-faced cone type; the change gear, of the three-speed selective pattern. Owing to the extraordinary proportions of the motor un-

usually high torque is developed at low speeds, so that the power plant is especially well fitted for continuous running on high gear. With the rear axle driving ratio of  $3\frac{1}{2}$  to 1, the engine has been developed to yield its maximum torque pull throughout the range of average touring speeds. Final drive is through a double jointed cardan shaft, the rear axle equipment being of the full floating type.

Owing to the method of hanging the springs and also to the type selected, unusually comfortable riding qualities are claimed for the car. The front springs are of semi-elliptical pattern. Three-quarter elliptic springs are used in the rear, but for the sake of obtaining the low center of gravity which is one of the noticeable qualities of the chassis, the lower members are hung on the under sides of the axles. The wheels are shod with 42 inch tires of 4 inch diameter. The wheel base is 120 inches, and the tread is standard, of 56 inches. One unusual and rather pleasing feature of the chassis design, which also lends not a little distinction to it is the method of mounting the acetylene gas tank. Instead of being carried on the running board as is the general custom, the tank is mounted transversely in front of the radiator. The frame side members are tied together in front by means of a stout tubular member, which also furnishes a handy support for

the searchlight brackets, which are reinforced by a second tie rod which points them at their upper ends. To the lower cross member the gas tank is secured by means of heavy metal straps.

The stock equipment of the car, which is made by the Owen Motor Car Co., Detroit, is complete to the last detail. It includes among the more regular equipment features, a top and slip cover, wind shield, speedometer, clock, gasoline gauge, electric horn, combination electric and gas head-

NEW OWEN CHASSIS

lights and combination electric and oil side lamps, tire chains, and trunk rack, in fact, practically everything but the gasoline itself.

#### "Semelle" as Relating to Tires.

As the result of a lawsuit which for more than a year has been in progress between Michelin & Co., of France, and the Austrian Continental Co., it has been decided by the minister of public works in Austria that the word "Semelle" is a trade mark to which the Michelin company is entitled to exclusive use. Although it is a common French word as applied to other arts and in a general way means the bottom or base of a structure, it has a peculiar and special meaning when stamped into the leather tread of a Michelin anti-skid tire and itself designates the anti-skid feature as applied to tires and is exclusively Michelin trademark property in this sense, according to the Austrian ruling.

**HERE'S THE UP-TO-DATEST HEARSE**

**Represents the Ideas of a Modern New York Undertaker—Conveys Both the Casket and the Mourners.**

New inventions and applications of new ideas in connection with motor propelled vehicles are cropping up in the most unexpected places. There is, for instance, in New York City an undertaker, Fred Hulberg, of 265 West 125th street, who has invented and patented a motor vehicle different in design and principle from any other car yet built. The patent was issued to Mr. Hulberg as long ago as April 27, 1909,

The motive power is furnished by a 45 horsepower Continental gasoline engine, situated under the chauffeur's seat, below the hearse compartment. The chassis has a wheel base of 138 inches, 60 inches tread, while the wheels are 34 inches, fitted with 4-inch solid rubber tires. It is fitted with Timken roller-bearing axles, three speeds forward and one reverse, multiple disc clutch, chain drive, and four brakes—two on rear wheels and two on the transmission shaft. Ignition is by Bosch high tension magneto, vibrating coil and timer—two complete systems with separate plugs. The cost to build this first car exceeded \$6,000, but Mr. Hulberg states that a second car could be built much cheaper by him, as he now has the patterns and some

NOVEL MOTOR HEARSE WITH SEATING SPACE FOR MOURNERS

but the vehicle itself has not been completed until recently. It is a hearse, which in addition to carrying the body will convey the mourners to the cemetery.

The hearse part of the car is entirely of steel, and the casket is put in in front, as will be seen from the doors in the accompanying picture. It is large enough to accommodate the very largest mahogany coffin made today. It extends into the passenger compartment 20 inches and is concealed from view by mahogany movable doors or partitions forming the appearance of a stateroom similar to that in a sleeping car. These doors are folded back when the casket is taken out, giving an additional space for two seats. The passenger compartment is made of wood and can accommodate 14 persons; the revolving chairs are upholstered in green leather, and the floor is handsomely carpeted, while the windows are fitted with regulation Pullman shades. The vehicle is lighted by electricity, and a telephone is fitted inside for communication with the chauffeur. Speedometer and electric signaling devices are installed. The outer finish is deep black.

experience. All the patterns necessary for the manufacturing of the car had to be made especially, as the ordinary touring car parts were found to be too light and the heavy truck parts too heavy. Mr. Hulberg endeavored to have the car built by some automobile manufacturer, but could find no one willing to go to the trouble; so he decided to build it in his own repair shop.

The repair shop itself is quite unique in the completeness of its equipment which even includes vacuum cleaning apparatus for brushing the 125 horses kept in his stable, and an electric power plant for lighting the premises and furnishing motive power for the various machines in his repair shop. He has built most of his own carriages and hearses.

Tests made with the new car since its installation a few days ago, have shown that it can do the work of four horse drawn carriages with four drivers, can travel at a speed of 20 miles an hour if desired, and make the trip to Woodlawn cemetery and back, including time consumed in the burial in a little over three hours. Horse-drawn funerals take from six to seven hours.

**HAIL! THE COMMERCIAL CAR COMES**

**Magazine Writer Discovers Its Approach and "Turns Loose" Accordingly—List to His Paean of Praise!**

Leslie's Weekly, in an enthusiastic editorial on March 10th, sings a paean of praise to the commercial motor car, such as would turn the salesman of a motor car factory green with envy. After vigorously asserting that motoring has proved a blessing to public health, and that motorists fight the great white plague with sunshine and fresh air, it launches into a description of the future and the advantages of the commercial motor car, which should prove the turning factor in many cases where the merchant or farmer is still undecided whether or not he "can afford" to buy an automobile.

Heading its article with the terse "Get an Automobile," the magazine continues:

"We are beginning to realize the scope of the commercial automobile. It is opening up the country. Suburban real estate is being developed in a marvelous manner. Farms in the vicinity of cities which brought from \$30 to \$40 an acre a few years ago are now divided into villa plots and bring twenty-five times their original value. The automobile is populating the mountain tops; it is taking travelers to every attractive nature spot.

"The farmer, through his familiarity with the gasoline engine, has been quick to see the possibilities of the automobile. He is putting it to untold uses. If a threshing machine breaks down, the hands are delayed but a few hours while the broken part is whisked 30 miles to a repair shop. City concerns which have extensive territory to cover are rapidly adopting the automobile. Horses are rendered worse than useless by blizzards and heavy slush, but the automobile delivery trucks have demonstrated that they are capable of weathering conditions which no horse driver would attempt to master. The automobile relieves the horse of the misery of slippery, hard pavements, the drudgery of hot streets, and the cruelty of drivers. The motor ambulance brings first aid to the injured. A complete emergency fire department—ladders, chemicals and hose—comes to your assistance swiftly and surely aboard a single, self-propelled conveyance. Public safety has been greatly increased at the time of riot or mob by the almost instant transportation of large numbers of police to the scene of trouble. The motorcycle will probably solve the question of policing our cities. Motorcycle men are kept in reserve at Toledo police stations. Anybody who needs a policeman in that city can get one within two minutes. Toledo covers 28 square miles, but there is not a place a motorcycle policeman cannot get to within five minutes.

"'Get a horse!' is no longer the cry of the street. 'Get an automobile!'"

## SIMPLE TESTS FOR LUBRICANTS

### How Flash and Burning Points May be Determined—Finding Acid and Grit—Little Apparatus Required.

While for ordinary purposes it is best to use only the standard grades of motor car lubricant, such as are recommended and sold under well-known brands, there are times when it is desirable to be able to examine the qualities of an unknown oil before putting it to the test of actual service. While complete apparatus for oil testing in general is applicable only to the laboratory of the trained chemist, there are a number of tests which may be applied by anyone who is inclined to take the simple measures necessary.

One of the most important of these is a method of determining the flash and burning points of the oil, and is intended to be applied in connection with what is known as a water bath. A simple device for the purpose may be made, as shown in the accompanying illustration. Into the lower part of the apparatus a, a sufficient quantity of water is put to cover the bottom of the upper part b, after it is in place. The oil to be tested is placed in the upper portion of the utensil and a thermometer, c, is suspended in the oil in such a way that it will not come into contact with the sides of the vessel. Heat is then applied and the rise in temperature of the oil is noted at regular intervals. As the temperature rises a match is repeatedly held near the surface of the oil, and after a time enough vapor will be given off to cause a brisk explosive flash. The temperature at which this occurs is known as the flash point of the oil. If the heating be continued above the flash point, a second point may be reached at which the oil on the surface will take fire. The point at which this temperature occurs is known as the burning point.

To determine whether an oil contains acid, perhaps the simplest test of all is to wind a piece of cotton waste around a polished steel rod or shaft, saturate it with the oil and then expose it to the sunlight in a warm place for several days. If the metal shows rust at the end of that time, the oil contains a sufficient amount of acid to be injurious to the journals, and probably to the cylinder walls as well.

A more exact method of test is given by the Scientific American, thus:

"Dissolve a small amount of sodium carbonate in an equal volume of water. Place it, together with the oil to be tested, in a flask or beaker and shake thoroughly. The quantity of precipitate will be a gauge of the amount of acid present.

"To detect the presence of grit," the above authority continues, "drop a small amount of the oil on white or very light-colored blotting paper. The oil will be ab-

sorbed, and the grit will be visible as small black specks on the blotter.

"To find the temperature at which the oil congeals: Put 15 parts of Glauber salts into a beaker (or clean tumbler). Place in this a bottle containing a sample of the oil. Place over the salt a mixture of 5 parts hydrochloric acid and 5 parts of cold water. The temperature is reduced slowly, and can be observed from time to time as the oil thickens. Any freezing mixture or even ice can be used in place of the above."

It may be added that the sodium carbonate, Glauber salts and hydrochloric, or

muriatic, acid may be obtained in small quantities at any drug store for a few cents.

### Telephone Service at the Wayside.

A novel wayside telephone service for the benefit of automobilists, whereby the latter are supplied with portable telephone sets that may be "plugged in" at points along the streets and country roads, is the latest offering of the "Independent" telephone companies, who are seeking to outdo their Bell rivals in enterprise and in winning the favor of the public. The Home Telephone Co. of Michigan explains the service to Michigan motorists as follows:

"Wayside service is furnished through a portable telephone set, specially designed, aluminum receiver and transmitter in one piece, weighing only 10 ounces, carried in a leather case, not heavy enough to be a burden in the pocket, nor big enough to be an annoyance in the automobile.

"Public connecting stations, not more than a quarter mile apart, whether in city or country, located on poles, street corners, trolley posts, etc., afford ready connection with the Home Telephone system. Insert the plug from your portable instrument and get instant service."

"For the immediate relief of the automobilist in trouble on the country road, or in the city after hours. A short walk to an open station, an instant telephone connection with the garage or repair man, and relief is on the way. You can also tell the wife that you will not be home for an hour or two."

Other people besides motorists may find this latter phase very convenient.

## WEIGHT ASSISTS BRAKING EFFECT

### Heavy Cars can be Stopped as Quickly as Light Ones at the Same Speed—Scientific Reasons.

It is commonly accepted, and indeed, self-evident, that the maximum braking power of a car is attained when the wheels are made to slide; but certain considerations which follow directly from this fact frequently are overlooked in discussions of the braking problem. One of these is that the minimum distance in which a car can be stopped depends on the rate at which it is traveling when the brakes are applied and on the condition of the road, but is practically uninfluenced by the weight of the car. This fact, while readily apparent to those who are familiar with technical subjects, is probably calculated to appeal to the layman as distinctly remarkable. It means, in a word, that the most powerful racing car can be brought up in the same distance as a touring machine of less power and more weight, when both are checked at the same rate of speed. An even more important conclusion is that the heavily loaded commercial vehicle traveling at its maximum of perhaps 12 miles an hour, can be brought to rest under emergency conditions as quickly as can a light runabout when going at the same rate.

The philosophy of the thing, however, is not so obscure as at first might seem to be the case. Supposing the wheels to be locked, it is evident that the only resistant factor to be considered must be the friction between the wheels and the ground. Frictional resistance, is governed in proportion to the weight in motion and to the nature of the rubbing surfaces. Thus the heavier the car, the greater the frictional resistance developed when the brakes are locked. The force which tends to impel the car forward after the power is cut off, on the other hand, is its momentum, which depends upon the weight and velocity. As the weight affects both the moving and retarding forces in direct and equal proportion, its effect is negligible. So that, strange as it may seem, the actual weight of the vehicle does not govern the distance it will slide in coming to rest; only the velocity and the traction being of moment. A brief expression for the same idea is that as the weight increases so do the tendency to continue in motion after the external supply of power is removed and also the frictional resistance.

It is an easy matter to demonstrate this by mathematical means, but for ordinary purposes it hardly is necessary. It also is not difficult to show that the principle applies equally well whether only the rear wheels are braked or whether the brakes are applied to all four wheels. In the latter case, although only a portion of the

weight is carried by the rear, and therefore sliding, wheels, the remainder being in constant proportion to the weight, may be considered as reducing the frictional resistance. So that for all practical purposes, the question of weight may be left out of consideration in connection with problems involving emergency stoppage.

It is important in this connection, however, to call attention to the fact that these considerations apply only when the wheels are locked; and therefore, that they express the limits which obtain when it is desirable or necessary to bring a vehicle to rest within the shortest possible time. With one exception, the sliding friction expresses the minimum stopping power of any vehicle. The exception is the generally trifling and always unreliable factor of windage.

Were the machine to move invariably through a body of still air, its motion would be resisted by a force roughly proportional to the square of its velocity, and its cross section area, and therefore of considerable magnitude at high speeds. As far as the question of windage may affect the emergency stopping powers of the average car, however, it may be considered almost negligible, since it decreases very rapidly as the speed of the vehicle is diminished.

In connection with a more technical consideration of this subject a foreign expert has recently prepared a number of calculations showing the minimum stopping distances of cars with both two and four wheel braking equipments, from which the accompanying table has been compiled. For comparative purposes, the theoretical windages at different speeds also are given. Incidentally the figures furnish a striking demonstration of the theoretical advantages of the four-wheel braking principle, which, as might be expected, may be considerable at very high speeds.

Speed. m.p.h.	Rear Wheel Brakes.—		Brakes on all Wheels.—		Windage. lbs. on 30 sq. ft.
	Distance Traveled. Feet.	Time Coming to Rest. Seconds.	Distance Traveled. Feet.	Time Coming to Rest. Seconds.	
70	397	7.7	260	5.1	530
60	290	6.6	194	4.38	396
50	200	5.5	135	3.65	275
40	126	4.4	86.5	2.92	174.5
30	73	3.3	48.5	2.2	97
20	32.3	2.2	21.5	1.46	43.6
10	7.33	1.1	5.37	.73	11
5	1.89	.55	1.34	.365	2.75

In presenting the calculations the expert in question adds a word as distinguishing between the power required to stop a car and that necessary to maintain it at a given speed, and also in regard to the quantity of motion to be dealt with supposing the car to be stopped instantaneously as in the case of a collision. He says:

"It may be well to point out here that to stop a car in motion is quite a different thing from maintaining it in speed—even a high rate of speed—because in the latter case we are using the power of the engine to overcome only the air resistance and the friction of the mechanical parts, together

with such losses as are set up by bumping over road inequalities; whereas in the former we have to dissipate the energy stored up by the momentum of the car which is equal to its weight multiplied by its velocity in feet per second. The actual momentum of a 2,000 pound car traveling at 40 miles per hour is a trifling (?) 117,600 foot-pounds, and the impact of such a force if stopped instantaneously would amount to . . . just 96 foot-tons, that is, it would strike the same blow as a weight of 96 tons falling through a height of one foot. Bearing this in mind, it does not surprise one that a car will travel some distance after the brakes are applied and the wheels locked."

#### Valuable Hints in Varnishing.

It is a mistake—mostly fatal to good results—to attempt to alter the composition or nature of the varnish by adding to or subtracting from or by thinning said material. The varnish maker is paid to assume that responsibility. You are simply charged with the duty of applying the varnish to the surface. That responsibility is sufficient to demand all your skill and attention, says the Carriage Monthly, in laying down rules for the automobile varnisher.

The surface to be varnished should be, as near as possible, of the same temperature as the varnish. A slight difference existing between the two will result in a bad working and an even worse looking varnish when it is finally shaped upon the surface.

Invariably store the varnish supply in a warm place, well up from the floor, where the temperature may be maintained at a uniform degree.

Keep an extra varnish can at hand in which to pour the surplus material at the conclusion of the day's work, or of the work

varnish pails or pots. Using varnish from a dirty dish defeats any plan for clean varnishing.

The varnish too thin in body, will lack the requisite depth and brilliancy, whereas, if too thick in body, it will refuse to flow out, in which state brush marks and "piling up" of the material inevitably ensue.

Avoid varnishing over a previously applied coat of varnish not thoroughly dry. Such a practice is the forerunner of surface fractures and checks. Give the varnish coats as they undergo the process of drying plenty of sunlight and ventilation. Varnish is human in this respect that it thrives upon sunshine and fresh air.

The best ventilation for the varnish room is through a five or six-inch pipe let through the ceiling and leading down into the apartment with a perforated drum attached to the lower end of the pipe, the drum containing loosely picked curled hair.

Washing the surface is a determining factor in all varnishing. Varnishers have a saying to the effect, "By their washing ye shall know them." A surface well washed, with no sediment clinging anywhere, is quite half finished.

In washing, use water—soft, preferably—plentifully, and do not spare the water tool. Work carefully around molding and all obstructions with this brush, in order to eliminate pumice stone and other deleterious surface atoms.

Guard the varnish brushes rigidly. Keep them in a clean receptacle, in a varnish exempt from driers, and exclude the air and all dust accumulations.

For the varnish room which cannot be mopped out, wet up common soft wood sawdust and sprinkle the floor, sweeping it immediately thereafter.

This is and has been the rule for the last century, but times change, and with the changes go the old ways and new ones are adopted. The vacuum cleaner is now used to suck up the dust directly from the floor and ledges. They are used in homes, offices, churches, theaters—in fact everywhere that dust gathers. For the varnish room nothing better could be used. All other places in the shop need cleaning, and the vacuum cleaner does the work.

#### Waste of Water Leads to a Strike.

Because of the excessive waste of water in the cleaning of its vehicles, the General Motor Cab Co., of London, recently decided that its garage grooms should use buckets instead of hose and nozzles. The company is one of the biggest in the world operating taximeter cabs and the consumption of water in its garages, until the compulsory use of buckets, was 360,000 gallons per day. With the introduction of the bucket method the consumption was reduced to 60,000 gallons per day, but the grooms who were called upon to carry buckets instead of using hose were very much dissatisfied, and 150 of them went on a strike, but the company remains firm for the bucket method.

in hand. Do not tolerate the practice of pouring refuse varnish back into the regular storage can or tank. It develops dirty work.

Buy, if possible, and have your winter's supply of varnish shipped ahead of the cold weather. There is real danger of the varnish becoming chilled during transportation with the mercury below freezing point.

Open up the varnish can, say, a half hour, before using the varnish to permit prevailing gases to dissipate, thus insuring improved working properties.

Do not under any circumstances use dirty

**MATHESON LAUNCHES A NEW "SIX"**

**Silence and Unusual Flexibility Among Its Strong Points—Wherein New Model Differs from Predecessor.**

Following a year and more of successful six-cylinder production, the Matheson Automobile Co., New York City, has announced a new model to supersede its original and staunch sextuple car, and distinguished as

NEW MATHESON "SILENT SIX" TOURING CAR

the "Silent Six." Nor is the appellation merely a nominal one, for it is explained with considerable pride that, while relatively noiseless operation long has been attainable by the use of suitable muffling devices, the silence of the new six is the result of structural developments which tend to quiet running without sacrificing either economy in operation or flexibility. Indeed, one of the strongest recommendations which has been given the new car is that so great is its flexibility that it can be brought down from full speed on high gear to a pace which can be attained without difficulty by a man walking backwards, and actually amounting to about three miles an hour.

Outwardly, the "Silent Six" does not differ materially from its immediate predecessor. It is here illustrated in five passenger touring form, with its complete stock equipment. In mechanical detail as well it is a close reproduction of the model "17" car, being rated at 50 horsepower, and having  $4\frac{1}{2}$  by 5 inch cylinders, cast in pairs and formed with large overhead valves, actuated by rocker arms from a single cam shaft on the right side. Transmission is by multiple disc clutch and axle mounted change gear. Its price has been advanced to \$3,500, however, which represents a \$500 increase over the cost of the previous model.

Points which distinguish the new motor from the old, and which may be supposed to contribute in greater or less degree to the silencing of its action are numerous though not strikingly radical. Lubrication is one feature which has undergone some change. In the new motor the engine is oiled by splash insofar as the pistons and connecting rods are concerned, but the crank shaft bearings and the timing gears

which are housed in front, and which, it may be mentioned, now are made of the spiral type, are drenched by a constant flow of oil which is supplied by an automatic gear pump drawing its supply from a sump in the bottom compartment of the case. By this device the level in the crank pits is held constant at all times, while the more vital portions of the motor are given a supply of lubricant in proportion to the speed of the engine and under conditions permitting of frequent inspection by the driver.

since all oil to the two principal feeding points is carried up to a sight feed glass mounted on the dash.

The crank shaft has been strengthened by increasing its diameter through the bearings from  $1\frac{3}{4}$  to 2 inches and from  $1\frac{3}{4}$  on the crank pins to  $1\frac{7}{8}$  inches; the crank webs being increased proportionately. A 3 inch plain bearing now is employed at the forward end of the crank shaft instead of the ball bearing formerly used. In the valve mechanism the gears, in addition to being made of the silent, spiral type, are

ing a vital bearing on the quietness of operation of the motor. The pistons are made  $\frac{3}{4}$  inch longer than before, while, in accordance with successful results previously attained, the practice of offsetting the crank shaft  $\frac{3}{4}$  inch has been continued.

Largely as a matter of convenience to the operator, the position of the magneto and water pump has been changed, both those auxiliaries being mounted further forward than before. Complete double ignition now is employed, with two sets of spark plugs and the Bosch magneto, together with batteries and Connecticut coil. The magneto is of the large three-pole type instead of the smaller two-pole pattern formerly carried.

The master clutch has hardened and ground discs, all of steel, 51 in number, which are fully housed and mounted directly in the flywheel. The release now is obtained through pressure on a ball thrust bearing, which also is fully enclosed and protected. The gearset is of the selective type, as before, the torsion tube being hung at the forward end in a ball and socket joint which encloses a universal joint of the trunnion block type. The bevel pinion and shaft of the gearset are made integral, closer adjustment for the mesh of the gears has been provided, the gears have been reinforced for strength and the main driving gear bearings have been increased in size. The gearset operation is of the selective type. Three speeds are provided, and the third speed affords the direct drive, which is used for all ordinary running conditions.

The rear wheels are shod with 36 by  $4\frac{1}{2}$  inch tires, instead of 36 by 4, as formerly, that size being retained for the front wheels, however. The wheel bearings, which are of

CHASSIS VIEW OF NEW MATHESON SIX CYLINDER MODEL

of  $\frac{1}{8}$  inch wider face, while the cam shaft has been increased from 1 inch to  $1\frac{1}{8}$  in diameter; its front bearing also having been lengthened somewhat. The cam faces are now  $\frac{1}{2}$  inch, instead of  $\frac{3}{8}$ , while the lifter rollers have been widened and also increased in diameter.

A more conspicuous change consists in the adoption of a sectional exhaust manifold which is made in three parts, with due provision for expansion; this member also hav-

the annular ball type, have been enlarged somewhat. The brakes, which are of the external contracting and internal expanding type, have been enlarged by increasing the width from 2 to  $2\frac{3}{4}$  inches. The adoption of full elliptic rear springs instead of the three-quarter elliptic arrangement is a new departure, as is the increase of 2 inches in the length of the front members, which are of the semi-elliptic order. The steering gear, which is of the worm and

sector pattern, is of entirely new design, ball bearing mounted and constructed with a four-thread worm. The steering wheel is 18 inches in diameter and the gear is provided with stops to prevent the connections from being chafed by the tires through excessive deflection.

The generally rugged construction of the

nected with the clutch but is left entirely free. The motor control levers are mounted on a ratchet segment above the steering wheel. As an auxiliary to the hand throttle, a pedal is provided on the right of the foot board, which is interconnected with the lever in governing the carburetter.

The brakes are applied by means of ten-

enough forward to gain some protection from the springs, while it also has ample clearance from the ground. The forward end of the machine is entirely protected on the under side by means of a housing which is joined to the crank case in front and extends back far enough to ensure protection for the flywheel and clutch. At the

LEFT SIDE OF NEW MATHESON SIX CYLINDER MOTOR

TOP VIEW

RIGHT SIDE, SHOWING VALVE GEAR AND CARBURETTER

chassis as a whole is plainly evident in the accompanying illustrations. Among noteworthy points in this connection, however, is the drop at the rear end of the frame which is provided in order to allow ample clearance for the axle without necessitating too great an elevation for the body. Another is the trussing of the forward portion of the chassis, which is braced forward of the waist line, and which combines with the characteristic formation of the motor base, with its broad flanges which extend outwardly to the frame, to render that portion of the vehicle extremely rigid. In the framework throughout unusual liberality in the adoption of wide flanges and liberal gusset plates is to be noticed, especially in point of the diagonal braces which reinforce the frame cross member which supports the forward end of the torsion tube. The traction load now is carried through radius rods at the side, which extend from a point at the waist line to the rear axle. By this means the universal joint of the propeller shaft and the torsion tube are relieved of a considerable portion of the stresses which otherwise they would be called upon to bear.

The control mechanism is of the usual order, save that all interlocking devices between the brakes and clutch are dispensed with. The left hand pedal, which controls the clutch, is entirely independent of the service brake actuating pedal, that member being placed on the other side of the steering column, while the outside lever, controlling the emergency brake is not con-

sion rods running down the center of the chassis to transverse balance beams. These are now placed in front of the intermediate cross frame member instead of behind it, as previously. The final brake motion is through tension rods on the outside of the

same time the housing is mounted high enough to give ample road clearance and to prevent any tendency to damage from protruding obstacles.

#### And Now the "Chauffeur-Maid."

Of course women as sales agents and demonstrators are not wholly novel, but housemaids as chauffeurs heretofore have not been in the limelight of publicity, and were the stories not borne out to some extent by a few bona-fide advertisements in London newspapers, one would be tempted to class them as "tall yarns." It seems that English ladies have found out how convenient it might be if a maid could be found to drive a runabout or touring car and at the end of the trip assist her mistress in "sprucing up" before entering the dining room of a hostelry. "Chauffeur-maids" have become a recognized profession, and automobile instruction schools in England have established additional classes in which to teach the maids the mysteries of the carburetter, spark plug, steering gear and magneto. So far the fair would-be chauffeurs have resolutely refused to bother with the intricacies of the motor or with the cleaning of the cars after a ride. Such mere "menial" labor they generously leave to the stable boys or hostlers.

Occasional attention should be paid to the small clips holding the outer leaves of elliptical springs. If they become loose they fail to check the rebound as they are intended to do.

MATHESON CHANGE GEAR

chassis. The gasoline tank is carried in the rear and is shaped in front to give ample clearance to the differential housing. This formation permits it to be carried far

## NEW YORK'S BILL IS AMENDED

**Non-Skid Restrictions Eliminated, but Fees are Unchanged—No Reciprocity Clause — Full Text of Bill.**

Although telegraph reports from Albany stated that the Callan automobile bill, which probably will become law in New York state on August 1st next, had been "cut to pieces" in the amending of it, most of the "150 amendments" prove to be trivial in character and are in the nature of improvement of verbiage more than anything else.

The registration fees and the fines and speed limits and most of the other essentials remain practically as outlined in the Motor World of March 17th. The clause restricting the use of non-skid devices, to the danger of which the Motor World was first to direct attention, has been wholly eliminated; the \$2 registration fee for vehicles operated wholly within the city limits has been stricken out also, but a new provision has been inserted permitting pleasure cars which have been in use and on which registration fees have been paid for four years to be registered thereafter at one-half the established rate. One of the other added provisions requires owners to report the sale of their cars. In the amending process, the license fee for chauffeurs was raised from \$2 to \$5 per year, and it is stipulated that the photographs they are required to file must not be more than 30 days old.

The telegraphed reports concerning the bill stated that a reciprocity provision had been included in the clause affecting non-residents, but this proves to have been a false alarm. The clause was not altered in any way, and unless a change is made later the roads of New York will remain free to the citizens of all other states.

By manifest unintention, three words have been dropped from the section respecting number plates, and as it now reads the letter "M" must appear on all such plates when the design is that it shall appear only on the plates used by makers' and dealers' cars. Mr. Callan's attention has been called to the omission, and undoubtedly it will be rectified.

After being amended the bill was restored to second reading. Its full text is as follows:

**Sec. 281. Definitions.** The term "motor vehicle" as used in this article, except where otherwise expressly provided, shall include all vehicles propelled by any power other than muscular power, except motor bicycles, motorcycles, traction engines, road rollers, fire wagons and engines, police patrol wagons, ambulances and such vehicles as run only upon rails or tracks. The term "local authorities" shall include all officers of counties, cities, boroughs, towns or villages, as well as all boards, committees and other public officials of such counties, cities, boroughs, towns or villages. The term "chauffeur" shall mean any person operating or driving a motor vehicle as an employee. The term "state" as used in this article, except where otherwise expressly provided, shall also include the territories and the federal districts of the United States. The term "owner" shall also include any person, firm, association or corporation renting a motor vehicle or having the exclusive greater than thirty days. The term "public highway"

shall include any highway, county road, state road, public streets, avenue, alley, park, parkway or public place in any county, city, borough, town or village, except any speedway which may have been or may be expressly set apart by law for the exclusive use of horses and light carriages.

**Sec. 282. Registration of motor vehicles; fees; renewals.** 1. Registration by owners. Every owner of a motor vehicle which shall be operated or driven upon the public highways of this state shall, except as herein otherwise expressly provided, cause to be used thereof, under a lease or otherwise, for a period filed, by mail or otherwise, in the office of the secretary of state a verified application for registration on a blank to be furnished by the secretary of state for that purpose, containing: (a) A brief description of the motor vehicle to be registered, including the name of the manufacturer and factory number of such vehicle, the character and amount of the motive power stated in figures of horsepower in accordance with the rating established by the Association of Licensed Automobile Manufacturers; (b) the name, residence, including county and business address, of the owner of such motor vehicle; (c) provided that, if such motor vehicle is used or to be used solely for commercial purposes, the applicant shall so certify.

2. Age of operator. No person shall operate or drive a motor vehicle who is under eighteen years of age, unless such person is accompanied by a duly licensed chauffeur or the owner of the motor vehicle being operated.

3. Registration book. Upon the receipt of an application for registration of a motor vehicle, as provided in this article, the secretary of state shall file such application in his office and register such motor vehicle or vehicles, with the name, residence and business address of the owner, manufacturer or dealer, as the case may be, together with the facts stated in such application, in a book or index to be kept for the purpose, under the distinctive number assigned to such motor vehicle by the secretary of state, which book or index shall be open to public inspection during reasonable business hours.

4. Certificate of registration. Upon the filing of such application and the payment of the fee hereinafter provided, the secretary of state shall assign to such motor vehicle a distinctive number and, without expense to the applicant, issue and deliver to the owner a certificate of registration, in such form as the secretary of state shall prescribe. In the event of the loss, mutilation or destruction of any certificate of registration, number plate license or badge, the owner or chauffeur, as the case may be, may obtain from the secretary of state a duplicate thereof upon filing in the office of the secretary of state an affidavit showing the fact and the payment of a fee of one dollar.

5. Times for registration and re-registration. Registration applied for on or before August first, nineteen hundred and ten, shall take effect on that date and certificates issued on such application or under any application made prior to January thirty-first, nineteen hundred and eleven, shall expire on the latter date. The fees for such registration shall be one-half of the annual fees provided herein. Registration thereafter shall be renewed annually in the same manner and upon payment of the same annual fee as provided in this section for registration, to take effect on the first day of February, in each year beginning with such date in the year nineteen hundred and eleven; and the certificates of registration issued thereunder or issued between any such dates shall expire on the succeeding thirty-first day of January.

6. Registration fees. The following fees shall be paid to the secretary of state upon the registration or re-registration of a motor vehicle in accordance with the provisions of this article: five dollars upon the registration of a motor vehicle having a rating of twenty-five horsepower or less; ten dollars upon the registration of a motor vehicle having a rating of more than twenty-five horsepower and less than thirty-five horsepower; fifteen dollars upon the registration of a motor vehicle having a rating of thirty-five horsepower and less than forty-five horsepower; twenty-five dollars upon the registration of a motor vehicle having a rating of forty-five horsepower or more; provided, that if a motor vehicle other than one used solely for commercial purposes shall have been licensed for four separate years hereunder and for which there shall have been paid the annual registration fees herein provided during said period, the annual registration fees thereafter shall be one-half the amount; and further provided that for motor vehicles which are used or to be used solely for commercial purposes, the fee for such registration shall be two dollars.

7. Fees in lieu of taxes. The registration fees imposed by this article upon motor vehicles, other than those of manufacturers and dealers and those used solely for commercial purposes, shall be in lieu of all taxes, general or local, to which motor vehicles may be subject.

8. Sale and registration by vendee. Upon the sale or transfer of a motor vehicle registered in accordance with this section, the vendor shall immediately give notice thereof with the name and residence of the vendee to the secretary of state, and the vendee shall, within ten days after the date of such sale or transfer, notify the secretary of state thereof upon a blank furnished by him for that purpose, stating the name and business address of the previous owner, if known, the number under which such motor vehicle is registered and the name, residence, including county and business address, of the vendee. Upon filing such statement vendee shall pay to the

secretary of state a fee of one dollar, and upon receipt of such statement and fee the secretary of state shall file such statement in his office and note upon the registration book or index such change in ownership.

**Sec. 283. Distinctive number; number plates.** 1. Distinctive number must be carried on motor vehicles. No person shall operate or drive a motor vehicle on the public highways of this state after the first day of August, nineteen hundred and ten, unless such vehicle shall have a distinctive number assigned to it by the secretary of state and a number plate with a number corresponding to that of the certificate of registration conspicuously displayed, one on the front and one on the rear of such vehicle, each securely fastened so as to prevent the same from swinging.

2. Number plates to be changed annually. Such number plates shall be of a distinctly different color each year, and there shall be at all times a marked contrast between the color of the number plates and that of the numerals or letters thereon.

3. Form of number plate. Such certificate of registration shall be of metal, at least six inches wide and not more than fifteen inches in length, on which there shall be the initials "N. Y." and there shall be the distinctive number assigned to the vehicle set forth in numerals four inches long, each stroke of which shall be at least five-eighths of an inch in width; provided that in the case of a motor vehicle registered under this article there shall be on such plate in addition to the foregoing the letter "M," each stroke of such letter to be at least four inches long and five-eighths of an inch in width. Such number plates shall be of a distinctly different color each year, and there shall be at all times a marked contrast between the color of the plates and that of the numerals thereon. No vehicle shall carry the numbers of more than one state at any time.

**Sec. 284. Registration by manufacturers and dealers; re-registration.** 1. Re-registration by manufacturers and dealers. Every person, firm, association or corporation manufacturing or dealing in motor vehicles may, instead of registering each motor vehicle so manufactured or dealt in, make a verified application upon a blank to be furnished by the secretary of state for a general distinctive number for all the motor vehicles owned or controlled by such manufacturer or dealer, such application to contain: (a) A brief description of each style or type of motor vehicle manufactured or dealt in by such manufacturer or dealer, including the character of the motive power stated in figures of horsepower in accordance with the rating established by the Association of Licensed Automobile Manufacturers; and (b) the name, residence, including county and business address, of such manufacturer or dealer. On the payment of the registration fee of fifteen dollars such application shall be filed and registered in the office of the secretary of state in the manner provided in section two hundred and eight-two of this article. There shall thereupon be assigned and issued to such manufacturer or dealer a general distinctive number and without expense to the applicant issued and delivered to such manufacturer or dealer a certificate of registration in such form as the secretary of state shall prescribe, and a number plate with a number corresponding to the number of such certificate of registration. Such number plate or a duplicate thereof shall be carried or displayed by every motor vehicle of such manufacturer or dealer when the same is operated or driven on the public highways. Such manufacturer or dealer may obtain as many duplicates of such number plate as may be desired upon payment to the secretary of state of one dollar for each duplicate. Nothing in this subdivision shall be construed to apply to a motor vehicle operated by a manufacturer or dealer for private use or for hire.

2. Re-registration annually. Such registration shall be renewed annually in the same manner and on the payment of the same fee as provided in this section for original registration, such renewal to take effect on the first day of February of each year. Provision of subdivision four of section two hundred and eighty-two, relating to first registrations made under this article and duration of renewals, shall apply to registration under this section.

**Sec. 285. Exemption of non-resident owners.** The provisions of the foregoing sections shall not apply to a motor vehicle owned by a non-resident of this state, provided that the owner thereof shall have complied with the provisions of the law of the state, territory or federal district of his residence, relative to motor vehicles and the operation thereof, and shall conspicuously display his state, territory or federal district number, and provided further that the provisions of the foregoing sections of this article are substantially in force in such state to the territory of federal district, provided that this exemption shall not apply to non-resident corporations doing business in this state.

**Sec. 286. Signaling and other devices; signals; rules of the road.** 1. Brakes, horns and lamps, signaling at crossings. Every motor vehicle, operated or driven upon the public highways of this state, shall be provided with adequate brakes in good working order and sufficient to control such vehicle at all times when the same is in use, and a suitable and adequate bell, horn or other device for signaling, and shall, during the period from one-half hour after sunset to one-half hour before sunrise, display at least two lighted lamps on the front and one on the rear of such vehicle, which shall also display a red light visible from the rear. The rays of such rear lamp shall shine upon the number plate carried on the rear of such vehicle in such manner as to render the numerals thereon visible for at least fifty feet in the direction from which the motor vehicle is pro-

ceeding. The light of the front lamps shall be visible at least two hundred feet in the direction in which the motor vehicle is proceeding. Every person operating or driving a motor vehicle on the public highways of this state shall also, when approaching a cross road outside the limits of a city or incorporated village, slow down the speed of the same and shall sound his bell, horn or other device for signaling in such a manner as to give notice and warning of his approach.

2. Stopping on signal, and other regulations. A person operating or driving a motor vehicle shall, on signal by raising the hand, from a person riding, leading or driving a horse or horses or other draft animals, bring such motor vehicle immediately to a stop, and, if traveling in the opposite direction, remain stationary so long as may be reasonable to allow such horse or animal to pass, and, if traveling in the same direction, use reasonable caution in thereafter passing such horse or animal; provided that, in case such horse or animal appears badly frightened or the person operating such motor vehicle is so signaled to do, such person shall cause the motor of such vehicle to cease running so long as shall be reasonably necessary to prevent accident and insure the safety of others. In approaching or passing a car of a street railway which has been stopped to allow passengers to alight or embark, the operator of every motor vehicle shall slow down and if it be necessary for the safety of the public he shall bring said vehicle to a full stop. Upon approaching a pedestrian who is upon the traveled part of any highway and not upon a sidewalk, and upon approaching an intersecting highway or a curve or a corner in a highway where the operator's view is obstructed, every person operating a motor vehicle shall slow down and give a timely signal with his bell, horn or other device for signaling.

3. Rules of the road. Whenever a person operating a motor vehicle shall meet on a public highway any other person riding or driving a horse or horses or other draft animals or any other vehicle, the person so operating such motor vehicle shall seasonably turn the same to the right of the center of such highway so as to pass without interference. Any such person so operating a motor vehicle shall, on overtaking any such horse, draft animal or other vehicle, pass on the left side thereof, and the rider or driver of such horse, draft animal or other vehicle shall, as soon as practicable, turn to the right so as to allow free passage on the left. Any such person so operating a motor vehicle shall, at the intersection of public highways, keep to the right of the intersection of the centers of such highways when turning to the right and pass to the right of such intersection when turning to the left.

Sec. 287. Speed permitted. Every person operating a motor vehicle on the public highway of this state shall drive the same in a careful and prudent manner and at a rate of speed so as not to endanger the property of another or the life or limb of any person; provided, that a rate of speed in excess of thirty miles an hour for a distance of one-fourth of a mile shall be presumptive evidence of driving at a rate of speed which is not careful and prudent.

Sec. 288. Local ordinances prohibited. Except as herein otherwise provided, local authorities shall have no power to pass, enforce or maintain any ordinance, rule or regulation requiring from any owner or chauffeur to whom this article is applicable any tax, fee, license or permit for the use of the public highways, or excluding any such owner or chauffeur from the free use of such public highways, excepting such driveway, speedway or road as has been or may be expressly set apart by law for the exclusive use of horses and light carriages or in any other way respecting motor vehicles or their speed upon or use of the public highways; and no ordinance, rule or regulation contrary to or in anywise inconsistent with the provisions of this article, now in force or hereafter enacted, shall have any effect; provided, however, that the power given to local authorities to regulate vehicles offered to the public for hire, and processions, assemblages or parades in the streets or public places, and all ordinances, rules and regulations which may have been or which may be enacted in pursuance of such powers shall remain in full force and effect; and provided, further, that local authorities may set aside for a given time a specified public highway for speed contests or races, to be conducted under proper restrictions for the safety of the public; and provided, further, that local authorities may exclude motor vehicles from any cemetery or grounds used for the burial of the dead, and may by general rule, ordinance or regulation exclude motor vehicles, used solely for commercial purposes, from any park or part of a park system where such general rule, ordinance or regulation is applicable equally and generally to all other vehicles used for the same purposes, and provided, further, that the powers given to local authorities in cities of the first and second class, to enact general rules and ordinances, establish traffic regulations regulating the speed of motor vehicles in such cities, and all ordinances, rules and regulations which may have been or which may be enacted in pursuance of such powers shall remain in full force and effect and be valid; provided, further, that the local authorities of cities of the third class and incorporated villages may limit by ordinance, rule or regulation hereafter adopted the speed of motor vehicles on the public highway, such speed limitation not to be in any case less than one mile in four minutes, and the maintenance of a greater rate of speed for one-eighth of a mile shall be presumptive evidence of driving at a rate of speed which is not careful and prudent, and on further condition that such city or village shall also have placed conspicuously on each

main public highway where the city or village line crosses the same and on every main highway where the rate of speed changes, signs of sufficient size to be easily readable by a person using the highway, bearing the words, "City of —" or "Incorporated village of —," "Slow down to — miles" (the rate being inserted), and also an arrow pointing in the direction where the speed is to be reduced or changed, and also on further condition that such ordinance, rule or regulation shall fix the penalties for violation thereof, which penalties shall, during the existence of the ordinance, rule or regulation, supersede those specified in subdivision two of section two hundred and ninety of this chapter, but shall not exceed the same.

Sec. 289. Registration of chauffeurs; renewals. 1. Registration of chauffeurs. Application to operate automobiles, as a chauffeur, may be made, by mail or otherwise, to the secretary of state or his duly authorized agent upon blanks prepared under his authority. The secretary of state shall appoint examiners and cause examinations to be held at convenient points throughout the state as often as may be necessary. Such applications shall be accompanied by a photograph of the applicant in such numbers and forms as the secretary of state shall prescribe, said photograph to be taken within thirty days prior to the filing of said application and to be accompanied by the fee provided herein. Before such a license is granted the applicant shall pass such examination as to his qualifications as the secretary of state shall require, and no license shall be issued until the secretary of state or his authorized agent is satisfied that the applicant is a proper person to receive it. No chauffeur's license shall be issued to any person under eighteen years of age. To each person shall be assigned some distinguishing number or mark, and the license issued shall be in such form as the secretary of state shall determine; it may contain special restrictions and limitations concerning the type of motor power, horsepower, design and other features of the automobiles which the licensee may operate; it shall contain the distinguishing number or mark assigned to the licensee, his name, place of residence and address, a brief description of the licensee for the purpose of identification and the photograph of the licensee. Such distinctive number or mark shall be of a distinctly different color each year and in any year shall be of the same color as that of the number plates issued for that year. The secretary of state shall furnish to every chauffeur so licensed a suitable metal badge with the distinguishing number or mark assigned to him thereon without extra charge therefor. This badge shall thereafter be worn by such chauffeur pinned upon his clothing in a conspicuous place, at all times while he is operating or driving a motor vehicle upon the public highways. Said badge shall be valid only during the term of the license of the chauffeur to whom it is issued as aforesaid. Every person licensed to operate automobiles as aforesaid shall indorse his usual signature on the margin of the license, in the space provided for the purpose, immediately upon receipt of said license, and such license shall not be valid until so indorsed. Every application filed under the provisions of this section shall be sworn to by the applicant before a justice of the peace or a notary public and shall be accompanied by a fee of five dollars.

2. Chauffeurs' registration book. Upon the receipt of such an application, the secretary of state shall thereupon file the same in his office, and register the applicant in a book or index which shall be kept in the same manner as the book or index for the registration of motor vehicles, and when the applicant shall have passed the examination provided for in the preceding section, the number or mark assigned to such applicant together with the fact that such applicant has passed such examination shall be noted in said book or index.

3. Unauthorized possession or use of license or badge. No chauffeur having registered as herein provided shall voluntarily permit any other person to possess or use his license or badge, nor shall any person while operating or driving a motor vehicle use or possess any license or badge belonging to another person, or a fictitious license or badge.

4. Unregistered chauffeurs cannot drive motor vehicle. No person shall operate or drive a motor vehicle as a chauffeur upon a public highway of this state after the first day of August, nineteen hundred and ten, unless such person shall have complied in all respects with the requirements of this section; provided, however, that a non-resident chauffeur, who has registered under provisions of law of the state, territory or federal district of his residence substantially equivalent to the provisions of this section, shall be exempt from registration under this section; and provided, further, he shall wear the badge assigned to him in the state, territory or federal district of his residence in the manner provided in this section.

5. Renewal. Such registration shall be renewed annually in the same manner and upon payment of the same fee as provided in this section for original registration, such renewal to take effect on the first day of February of each year. The provisions of subdivision four of section two hundred and eighty-two relative to first registration under this article and duration of renewals shall apply to registration under this section.

290. Penalties for violations. 1. The violation of any of the provisions of sections two hundred and eighty-two, two hundred and eighty-three and two hundred and eighty-four of this article shall constitute a misdemeanor punishable by a fine not exceeding fifty dollars.

2. The violation of any of the provisions of sec-

tion two hundred and eighty-seven of this article shall constitute a misdemeanor punishable by a fine not exceeding one hundred dollars for the first offense, by a fine not exceeding one hundred dollars or imprisonment for not exceeding thirty days, or both, for a second offense, and by a fine not exceeding two hundred and fifty dollars and imprisonment not exceeding thirty days for a third or subsequent offense; but nothing herein shall prevent the indictment of a person so violating.

3. Penalties for operating automobile while in an intoxicated condition; for going away without stopping after accident. Whoever upon any highway operates an automobile while in an intoxicated condition, or who after causing injury to any person or property and having knowledge thereof goes away without stopping or making himself known to such person injured or owner or possessor of the property injured or to any other person present on request, shall be punished by a fine of not more than five hundred dollars or by imprisonment for a term not exceeding two years, or by both such fine and imprisonment; and if any person be convicted a second time of either of the foregoing offenses, he shall be guilty of a felony punishable by imprisonment for a term of not less than one year and not more than five years. A conviction of a violation of this subdivision shall be reported forthwith by the clerk of the trial court to the secretary of state, who shall thereupon suspend the license of the person so convicted or if he be an owner the certificate of registration of his motor vehicle and upon final affirmation of such conviction and upon notice thereof by said clerk, the secretary of state shall revoke such license, or in case of an owner the certificate of registration of his motor vehicle, and shall order the license or certificate of registration delivered to the secretary of state, and shall not reissue to him said license or certificate of registration unless the secretary of state in his discretion, after an investigation or upon a hearing, decides to reissue or issue such license or certificate.

4. Upon a third or subsequent conviction of a chauffeur for a violation of section two hundred and eighty-seven, or an ordinance establishing traffic regulations or regulating speed of motor vehicles under section two hundred and eighty-eight, the secretary of state shall forthwith revoke the license of the person so convicted and no new license shall be issued to such person for at least six months after the date of such conviction nor thereafter except in the discretion of the said secretary of state.

5. The violation of any of the provisions of section two hundred and eighty-nine of this article shall constitute a misdemeanor punishable by a fine not exceeding fifty dollars.

6. Any person using, driving, injuring or tampering with a motor vehicle without the permission of the owner of such motor vehicle is guilty of a misdemeanor punishable by a fine not exceeding one hundred dollars or imprisonment of not more than six months.

7. Any person making a false statement in the verified application for registration mentioned in subdivision five of section two hundred and eighty-two shall be guilty of a misdemeanor punishable by a fine of not exceeding fifty dollars.

8. Any person violating any of the provisions of any section of this article for which violation no punishment has been specified, shall be guilty of a misdemeanor punishable by a fine of not exceeding twenty-five dollars.

9. Certifying conviction, to the secretary of state. Upon the conviction of any person for a violation of any of the provisions of this article by a magistrate, or when a court of record, such magistrate or the clerk of such court, as the case may be, shall immediately certify the facts of the case, including the name and address of the offender, the judgment of the court and the sentence imposed, to the secretary of state, who shall enter the same either in the book or index of registered chauffeurs, as the case may be, opposite the name of the person so convicted, and in the case of any other person, in a book or index of offenders to be kept for such purpose. If any such conviction shall be reversed upon appeal therefrom, the person whose conviction has been so reversed may serve on the secretary of state a certified copy of the order of reversal, whereupon the secretary of state shall enter the same in the proper book or index in connection with the record of such conviction.

10. Release from custody, bail, et cetera. In case any person shall be taken into custody charged with a violation of any of the provisions of this article, he shall forthwith be taken before the nearest magistrate, or before any accessible captain, sergeant of police or acting captain or sergeant of police, who has the power to accept bail, and be entitled to an immediate hearing or admission to bail unless charged with a felony, and if such hearing cannot then be had, he shall be released from custody on giving a bond or undertaking, executed by a fidelity or surety company authorized to do business in this state, or other bail in the form provided by section five hundred and sixty-eight of the code of criminal procedure, such bond or undertaking to be in an amount not exceeding one hundred dollars, for his appearance to answer for such violation at such time and place as shall be indicated, except that where a person is taken into custody on a charge of violating any of the provisions of subdivision three of section two hundred and ninety of this act, such bond or undertaking shall be in an amount not less than five hundred dollars and not exceeding one thousand dollars, or on giving his personal undertaking to appear to answer for such violation at such time and place as shall then be indicated, secured by the deposit of a

sum of money equal to the amount of such bond or undertaking, or in lieu thereof, in case the person taken into custody is the owner, by leaving the motor vehicle, or in case such person taken into custody is not the owner, by leaving the motor vehicle as herein provided with a written consent given at the time by the owner who must be present, with such officer; or in case such person is taken into custody because of a violation of any of the provisions of this article other than on a charge of violating any of the provisions of subdivision three of section two hundred and ninety of this act, and such officer is not accessible, be forthwith released from custody on giving his name and address to the person making the arrest and depositing with such arresting officer the sum of one hundred dollars, or in lieu thereof, in case the person taken into custody is the owner, by leaving the motor vehicle, or, in case such person taken into custody is not the owner, by leaving the motor vehicle with a written consent at the time by the owner who must be present; provided that, in such case, the officer making the arrest shall give a receipt in writing for such sum or vehicle deposited and notify such person to appear before the most accessible magistrate, naming him, and specifying the place and hour. In case such bond or undertaking shall not be given or deposit made by the owner or other person taken into custody, the provision of law in reference to bail, in cases of misdemeanor, shall apply, except that where the charge is a violation of subdivision three of section two hundred and ninety of this act, the provisions of law in reference to bail in cases of a felony shall apply.

11. Holding defendant to answer where magistrate has not jurisdiction to try offender; admitting to bail. In case the magistrate before whom any person shall be taken, charged with the violation of any provision of this article, shall not have jurisdiction to try the defendant, but shall hold the defendant to answer as provided by section two hundred and eight of the code of criminal procedure, he shall admit such defendant to bail upon his giving a surety company's bond or undertaking to appear to answer for such violation at such time and place as shall then be indicated, or upon his giving a written undertaking in the form provided in section five hundred and sixty-eight of the code of criminal procedure in a sum not exceeding one hundred dollars, except that in a case where the defendant is charged with a violation of any of the provisions of subdivision three of section two hundred and ninety of this act, such undertaking shall be in the sum of not less than five hundred dollars, or upon depositing such amount in cash or upon depositing the motor vehicle with such magistrate or clerk of the court who shall give a receipt in writing for such sum or such vehicle.

12. Disposition and return of bail. Such bail as may be deposited as herein provided shall be held by the officers accepting the same or the clerk of the court. Upon the person who has been taken into custody and given security or bail for his appearance presenting himself for trial, before the beginning of such trial, the property or money given as security or bail shall be returned to him by the officer having custody thereof.

Sec. 291. Disposition of registration fees; fines and penalties. 1. The registration fees provided herein shall be paid by the secretary of state into the state treasury.

2. Disposition of fines and penalties. On the first day of each month or within ten days thereafter all fines, penalties or forfeitures collected for violations of any of the provisions of this article or of any act in relation to the use of the public highways by motor vehicles now in force or hereafter enacted, under the sentence or judgment of any court, judge, magistrate or other judicial officer having jurisdiction in the premises, shall be paid over by such court, judge, magistrate or other judicial officer to the treasurer of the state, with a statement accompanying the same, setting forth the action or proceeding in which such moneys were collected, the name and residence of the defendant, the nature of the offense, and the fine, penalty, sentence or judgment imposed. On the first day of each month or within ten days thereafter, every judge, magistrate or clerk of a court having jurisdiction of the violation of any of the provisions of this article, shall make and forward to the treasurer of the state a verified report of all criminal actions or proceedings instituted or tried before him or it during the preceding calendar month for violation of any of the provisions of this article, which report shall set forth the name and address of the defendants, the nature of the offenses and the fines and penalties collected or imposed by such court, judge, magistrate or judicial officer, which report shall be open to inspection during reasonable business hours to any citizen of the state. On or before the first day of February of each year, the treasurer shall transmit to each branch of the legislature a statement showing the amount of the receipts under this article during the preceding fiscal year paid into the state treasury.

3. All moneys paid into the state treasury pursuant to this article shall be appropriated and used for the maintenance and repair of the improved roads of the state, under the direction of the state commissioner of highways.

Sec. 292. Rates of toll on motor vehicles. Where a different rate is not otherwise prescribed or permitted by law, any person or corporation maintaining a plankroad, turnpike road or bridge and authorized, or which shall be hereafter authorized, to receive tolls for the passage of vehicles over the same, may charge and receive for each and every motor vehicle

propelled by any power other than animal power, passing over the same, a toll rate not greater than the maximum rate allowed by law to be charged and received for the passage of a vehicle drawn over such road or bridge by two animals, provided that for such motor vehicles designed to carry only two persons the rate of toll charged or received shall not exceed the maximum rate allowed by law to be charged and received for the passage of a vehicle drawn over such road or bridge, without a load, by a single animal.

Sec. 293. Acts repealed. All acts or parts of acts inconsistent with this article or contrary thereto are hereby expressly repealed.

Sec. 2. This act shall take effect August first nineteen hundred and ten, excepting that applications for registration may be made, examinations held and registration certificates and badges issued, under the provisions of this article at any time within ninety days prior to such act.

### And This Is the United States of America!

The legislatures of Massachusetts and Rhode Island, which are neighboring states and not foreign countries, are more or less heated up by differences arising from the enforcement of the reciprocal provisions of their respective automobile laws. Rhode Island now allows "outlanders," that is, non-residents, 10 days free travel each year, and the Massachusetts folk claim that the Rhode Islanders are using a bell punch or in some way "keeping tabs" so closely that no Bay Stater can get away with more than the allotted pound of flesh, so to speak, while Massachusetts is more generous and permits installments of ten days. To "get even," a bill has been introduced in the Bay State which defines reciprocity as the same exact treatment meted out to Massachusetts residents by other states—in other words, an eye for an eye, a day for a day, etc., etc. Meanwhile Little Rhody has suffered an attack of liberality and is wrestling with an amendment to its reciprocity clause that would enlarge the 10 days to 20. But not all of its legislators favor it. It is believed, however, that civil war will be averted and that the use of Federal troops will be unnecessary!

### When Cheating is not a Crime.

Although the taxicab companies pay taxes and registration fees and fines to the state, the learned Supreme Court of Massachusetts last week ruled that no one need pay for a taxicab ride unless he felt disposed to do so. Although a generation ago the highest courts ruled that a bicycle is a carriage, the Massachusetts tribunal holds that a taxicab—and presumably all other automobiles—is not a carriage, simply because our great grandfathers never thought of such a vehicle. The court's logic is identical with that which frequently was brought to bear in the early days of the bicycle, its ruling being as follows:

"It is certain that when this statute was originally enacted, the legislature, in using the word 'carriage' had no thought of a vehicle made up in large part of complicated machinery, and propelled by a powerful engine whose operation is similar to that of a locomotive engine on railroads. While such vehicle may be called a carriage in the broad sense that it is used to carry persons and property, it is not commonly referred to as a carriage, but is distinguished from carriages by another name to design-

nate a vehicle of an entirely different character. We are of opinion that automobiles are not included in this statute."

The court says the defendant well contends that a criminal statute is always construed strictly in favor of the defendant, making it appear that in a civil suit, a taxicab may be held to be a carriage.

The case involved was that of one James C. Coleman, who on August 9th last hired a taxicab and who, for refusing to pay the established rate, \$8.50, was arrested under the law which provides that "whoever with intent to cheat or defraud the owner thereof, refuses to pay for the use of a horse or carriage, the lawful fare established therefor, shall be punished by a fine of not more than \$20, or by imprisonment for not more than two months, or by both fine and imprisonment."

Goldman was found guilty in the lower court, but appealed and won out. Following the decision the taxicab owners were thrown into a panic and have appealed to the legislature for a law that will afford them protection and right the ridiculous situation.

### Tudor Heads Hurtubis's Association.

The so-called National Automobile Association, which used to be the Automobile Owners Association of Boston, Mass., has elected the following officers for the ensuing year: Frederic Tudor, Needham, president; A. G. Bullock, Worcester, first vice-president; Andrew B. Cobb, Newton, second vice-president; Francis Hurtubis, Jr., Boston, secretary and counsel; John M. Graham, Boston, treasurer. Directors, Samuel Carr, Boston; Bayard Thayer, Lancaster; Harry L. Burrage, Newton; Charles L. Edgar, Boston; John M. Graham, Boston; P. W. Whittemore, Boston; R. H. Stearns, Jr., Boston; Andrew B. Cobb, Newton; A. G. Bullock, Worcester; John H. Child, Brookline; Francis Hurtubis, Jr., Boston; Frederic C. Hood, Brookline; R. E. Townsend, Roxbury; Samuel E. Winslow, Worcester; Spencer Borden, Fall River; Frederick Harris, Springfield; Allan Forbes, Westwood; B. L. Beal, Boston; Frederic Tudor, Needham.

### Why an ex-Chauffeur Wants \$50,000.

Although Daniel Rohrer swears he is suffering from enlargement of the heart, it evidently has not affected his nerve. Rohrer was a one-time chauffeur for John H. Tyson, a young high roller with more money than other essentials, who has been mixed up in a couple of high speed automobile tragedies, but who has managed to keep out of jail, and it is due to what he terms Tyson's recklessness that the ex-chauffeur says his heart expanded and his health was so shattered that he had to quit chauffeuring and become a watchman. He thinks \$50,000 of Tyson's money would help relieve his sad condition, and accordingly has filed suit for that amount in the New York Supreme Court.

## JERSEY SENATORS ARE ALARMED

**Make a Hasty Repentance and Prepare a  
"No Admission Fee" Bill of Their Own  
—Its Provisions.**

Having heard that the pending bill in New York was being so amended as to include a "reciprocity clause" and that thereby the marooning of New Jersey would be rendered complete, the more or less grave and reverend Senators of the New Jersey legislature have executed an about face.

Only two weeks ago, led by Would-be Governor Frelinghuysen, the Senate voted down the Edge bill, which had been passed by the Assembly and which would have abolished the registration fee imposed on non-residents, but the unexpected news from New York brought even Frelinghuysen to his senses and the Senators now have prepared a "no-admission fee" bill of their own. It was introduced by Senator Wilson, but despite the eleventh hour repentance, whether it becomes a law remains to be seen, as the legislature is due to adjourn today (Thursday).

The Wilson measure not only provides for the free entry of non-residents three times per year, but it scales the maximum fee for residents, proposed by Senator Brown, from \$25 to \$15. The New Jersey senators, possibly to save a part of their faces, could not, however, bring themselves to permit "foreigners" from other of the United States to enter without restrictions, the Wilson bill requiring them first to obtain a permit. The text of the bill is as follows:

"Hereafter no automobile except as hereinafter provided shall be registered by the Commissioner of Motor Vehicles or his agent until the applicant therefor shall have paid for such registration a fee of \$3 for automobiles of the first class, \$5 for automobiles of the second class, \$10 for automobiles of the third class, and \$15 for automobiles of the fourth class. Automobiles of less than 10 horsepower shall be of the first class. Automobiles of 10 to 24 horsepower, inclusive, shall be of the second class; automobiles of 25 to 39 horsepower, inclusive, shall be of the third class, and automobiles of 40 horsepower and above shall be of the fourth class.

"It is hereby provided that non-residents of this State shall be exempt from the provisions of this act, as well as the provisions of the act to which this is a supplement, so far as such act relates to matters pertaining to the registration of automobiles for any number of periods not exceeding three, which periods are not to be more than five days in duration; provided, that such non-residents shall have complied with the requirements of the state in which they reside, and display upon their motor vehicles number tags that indicate the state by which they are issued and their registry number; provided, further, that such non-residents shall, either before entering the state or at the nearest registry office where licenses can be obtained within the state,

obtain an official permit, which permit shall be issued without charge.

"The Commissioner of Motor Vehicles is hereby authorized and directed to establish as many agencies within or without the state for issuing of such permits as may be necessary to conveniently and speedily accommodate all non-residents who may apply for the same, and the said Commissioner of Motor Vehicles is authorized to make such other rules and regulations as may be necessary for the carrying out of the spirit of this act.

"All acts and parts of acts inconsistent with this act are hereby repealed, and this act shall take effect immediately."

### Dogberry Entangles German Dealers.

It takes a pendantic German to read into laws meanings that were not intended. The highest court in the Fatherland just has

NEW POPE-HARTFORD FIRE ENGINE WHICH REVEALS NOVEL FEATURES.

sentenced an automobile dealer to 400 marks fine, because he gave a "demonstration" to an intending purchaser in a car having no license number. The peculiar phase of the matter is that the German law distinctly exempts "cars used on a demonstrating trip, when not rented out or otherwise paid for," but the Reichsgericht says that only brand new cars are meant by this, and if a dealer takes a glittering car out of the show room and gives a demonstration on it, he may do so "once, and once only" without paying a registration fee; but if he should use it a second time he must pay the fee first. This court claims that a car, similar in appearance and construction should not be used as a demonstration car, or if used must be registered. German dealers are up in arms over the decision, which is contrary to the order of the Chancellor of the Empire, which distinctly exempts all cars used only for demonstrating purposes, from registration.

### Altering Springs to Changed Bodies.

When a light summer body is substituted for the standard enclosed mounting of a town car or limousine, the suspension frequently may be improved by removing the outer leaves from the rear springs. Sometimes it is even better to substitute a new and more supple equipment.

## WAS BOUGHT BY SUBSCRIPTION

**Fire Fighting Automobile for Port Chester  
Purchased with Citizens' Contributions  
—Embodies Improved Equipment.**

Although motor driven fire apparatus has ceased to be a novelty in the strict sense of the word, there are some distinctly novel features connected with the latest chemical engine manufactured by the Pope Mfg. Co., of Hartford, Conn., for the city of Chester, N. Y., which mark an improvement in construction as well as giving to the vehicle a more pleasing exterior.

Instead of the old style single tank for

chemicals, the new engine contains two tanks of 40 gallons capacity each, placed at the rear of the body, as shown in the accompanying photograph. The center of gravity of the machine is placed very low, giving to the vehicle a more business-like appearance and much greater stability. Besides the ordinary equipment of chemical engines, the machine carries two extra charges of chemicals in brass jars on the rear foot board, ladders hanging in brackets at both sides, and two 3-gallon hand extinguishers. The wheel base is 130 inches, wheels 36x5, and the horsepower is 40. The money for this engine was raised by subscription by the citizens of Port Chester.

### Boston Wants Its "Easy Money" Share.

The city of Boston wants some of that "easy money" which the state of Massachusetts is collecting from motorists, and his honor, the mayor, has intimated that if the city doesn't get its "bit," it may close its parks and parkways to the automobilists. The mayor dropped the intimation at a legislative hearing last week on a bill which provides that 25 per cent. of the state registration fees shall go to the city of Boston and another 25 per cent. to the metropolitan park commission. They "need it in their business," of keeping the parkways in repair.

**T**HE New Rambler Offset Crank-shaft enables you to throttle down on high gear no faster than a man usually walks. This means that in crowded traffic, much gear shifting is avoided. The straight-line drive takes the power direct from the engine to the rear axle without encountering the angle or corner, found in most other driving systems. Thirty-six inch wheels give high clearance and add to the appearance and riding qualities. The Spare Wheel eliminates tire worry because this wheel, with inflated tire, can so quickly and easily be substituted for the damaged tire. The efficiency of these features has been attained by the same painstaking methods which made Rambler quality possible.

Rambler Automobiles, \$1,800 to \$3,750

Rambler Garage Co., 918 Sheridan Road

## Club Elections

The annual election of officers of the Lancaster (Pa.) Automobile Club resulted as follows: H. C. Schock, president, and A. D. Rider, secretary.

The Cass County Automobile Club has been formed at Harrisonville, Mo., with the following officers: Dr. J. B. Douglass, president; Charles L. Harris, secretary.

Milwaukee (Wis.) motor drivers have formed a club with the following officers: Mark Werncke, president; Emil Kruger, vice-president; J. E. Maybruy, secretary; Michael Flynn, treasurer.

Automobile owners of Macon, Ga., have formed the Macon Automobile Club, with the following officers: Frank B. West, president; S. R. Jacques, Jr., vice-president; J. C. Wheeler, secretary; R. L. Sparks, treasurer.

Motorists of Wellsville, N. Y., have formed the Auto Good Roads Club of Wellsville, with the following officers: H. B. Stiffin, president; Dr. C. L. Gihls, vice-president; Thomas O'Connor, secretary; Edward C. Brown, treasurer.

New officers have been elected for the coming year by the Minneapolis (Minn.) Motor Drivers Club, as follows: O. E. Hall, president; J. H. Boldigh, first vice-president; M. M. Miles, second vice-president; Paul Eckland, secretary; George Gagne, treasurer.

Chauffeurs of San Antonio, Tex., have organized under the style of the Association of Automobile Engineers of San Antonio, and elected the following officers for the initial term: V. P. Kenney, president; D. W. McElroy, first vice-president; E. E. Ericson, second vice-president; Fred Wells, third vice-president; H. S. Ashford, secretary and treasurer.

With the enactment by the city fathers of Oklahoma City, Okla., of an ordinance regulating the fares of vehicles used for hire, drivers of motor livery vehicles have organized to fight the measure and elected the following officers: George W. Brandon, president; Chris Schwaebe, secretary, and N. N. Gatlin, treasurer.

The following officers have been elected for the ensuing term, at the annual meeting of the Chauffeurs and Auto Mechanics Club of Houston, Tex.: Van Curtis, president; W. J. Terry, vice-president; Mark Idelbach, secretary; B. F. Foster, treasurer; board of governors, George A. Ayers, Frank Bettis, Lundley Kent.

At the annual meeting of the Lancaster (Pa.) Automobile Club the following officers were elected for the ensuing year: H. S. Schrack, Mt. Joy, president; Dr. J. F. Trexler, Lancaster, vice-president; Jacob D.

Rider, Lancaster, secretary; Dr. W. H. Trout, Lancaster, treasurer; directors, W. H. Muth, Lititz; Howard Rohrer, Lancaster; George W. Kinzer, New Holland.

The board of governors of the Willimantic (Conn.) Automobile Club have appointed the following chairmen of committees for the coming year: Frank L. Powell, membership; E. Frank Bugbee, laws and ordinances; Edward F. Whitmore, contests and tours; Walter B. Knight, good roads; W. B. Knight grievances; George E. Hinman, executive; Samuel Chesbro, entertainment.

The Texas State Automobile Association has been incorporated under the laws of that state and, of course, will now formally affiliate with the A. A. A. The incorporators are the following: E. H. R. Green, Dallas; R. W. Scarr, C. C. Cresson, San Antonio. Following are the directors, composed of two members from each club in the association: E. H. R. Green, E. Corley, Dallas; J. W. Mann, M. O. Popterl, Galveston; R. E. McKie, J. T. Goforth, San Marcos; Drs. A. H. vans, Lee Hume, Eagle Pass; Henry Williams, W. N. Seeley, Waco; R. W. Scarr, C. C. Cresson, San Antonio.

### A. C. A. Bids for "Tourist Members."

The Bureau of Tours Committee of the Automobile Club of America, of which Gen. George Moore Smith is chairman, has greatly enlarged the scope of the organization's touring bureau, so that members now can secure detailed road information for tours in any state of the Union. A plan has also been perfected by which any automobilist can join the club as a "tourist member" and have the benefit of all facilities and advantages of the bureau of tours for a yearly membership fee of \$10. In addition to the facilities in connection with route cards, maps, guides, etc., the tourist members may enjoy the privileges of a chain of automobile clubs, where they may stop on their travels and receive the temporary privileges of each of the club houses.

Two route surveying automobiles are to be kept on the road during the entire coming season, the crews gathering information for tourists, mapping out new routes and investigating roads, hotels, garages, etc. The first survey car will leave New York during the coming week for the purpose of surveying the roads of South Carolina, Georgia, Florida, Alabama and Tennessee and doing some road posting with the club's yellow arrow signboards.

### Supreme Court Upholds Garage Owner.

Although it is admitted that garages do make a certain amount of noise, and that they also do emit certain offensive odors, they can not be put out of business for those reasons alone. The Appellate Division of the Supreme Court of New York just has decided the point in the case of Richard W. Sherman, brother of Vice-President Sherman, of Utica, N. Y., who obtained

from Supreme Court Justice Scripture an injunction a short time ago, against Harry M. Levingston, restraining the latter from operating an automobile garage next to the Sherman home. Levingston, however, appealed to the Supreme Court and the order was reversed, all the justices concurring.

### Revenge for Child Kills Five.

That not all automobile accidents are really "accidents," is the conclusion arrived at by the German authorities after investigating the tragic deaths of the Argentine Consul Geiger and four of his friends. The car in which these men drove not far from Munich, Bavaria, after nightfall, crashed into a tree deliberately felled across the road. A series of similar accidents has occurred in the suburbs, and the authorities began a most searching investigation with the result that they discovered evidence indicating that all these accidents had been planned by a peasant, who sought to avenge a child killed by a machine. Besides "punishing" automobile drivers, he expected to induce the government to adopt more stringent ordinances against fast driving.

### Chauffeurs Form "National Association."

Under the style The Professional Chauffeurs Association of America, William H. Walter, William H. Lescher, Jacob N. Harrison, Bruno G. Darre and Harry Chandler, of Providence, R. I., have incorporated under the laws of that state, what they call "a national organization for the co-operation of organized chauffeurs, who are interested in the welfare and progress of their profession." Its purposes are "to co-operate with other organizations in securing rational legislation governing chauffeurs and automobiles; to promote and encourage the construction of good roads; to dignify and elevate the profession of the chauffeur, and to defend and protect the chauffeur against claims of pretenders."

### When Learners Need no License.

In a test case brought before Justice Doull, in New York Special Sessions, by an automobile school, a decision has been handed down making it unnecessary for a student while learning to drive an automobile to have a license, when accompanied by a regularly licensed instructor. Heretofore city magistrates have differed in their opinion regarding this point, and one of the automobile schools of the city of New York brought the case to a higher court with the result given.

### Connecticut to Oil All Roads.

Highway Commissioner McDonald, of Connecticut announced his decision of treating all the roads in the state with an asphalt base oil, as best adapted for macadam roads. There will be a man in each county to personally supervise repairs, and another man will have charge of the oiling of the roads throughout the state.

## RECENT PATENTS.

946,780. Internal Combustion Engine. Philip D. Johnston, Cold Spring, N. Y., assignor to American Oil Engine Company, a Corporation of New York. Original application filed Aug. 17, 1906. Serial No. 330,971. Divided and this application filed May 17, 1907. Serial No. 374,266.

An internal combustion engine having a mixing chamber, means for introducing a stream of liquid fuel into the chamber, and means for introducing a stream of air into the chamber and against the stream of fuel, means for introducing a stream of water into the chamber and against the stream of fuel, the air inlet pipe and the water pipe passing through a portion of the exhaust passage of the engine so as to be heated by the products of combustion.

947,036. Lantern. William S. Mamm, Lakeside, Ill., assignor to The Adams & Westlake Company, Chicago, Ill., a Corporation of Illinois. Filed Dec. 29, 1906. Serial No. 350,022.

1. In combination, a lantern having a font, a reflector, and a support for the reflector comprising a standard rising from the font and having a channeled seat for receiving the edge of the reflector, and a spring arm having a fixed anchorage and engaging the reflector at its rim above its horizontal diameter.

947,167. Auxiliary Spring. Charles L. Thomas, Buffalo, N. Y. Filed March 17, 1909. Serial No. 483,889.

1. The combination with the main spring of a vehicle, of an auxiliary spring which is

lighter than the main spring and is rigidly secured at one end, a frame which is normally supported by the free end of said auxiliary spring, and a lost motion connection between the free end of said auxiliary spring and the free end of said main spring for causing the main spring to supplement the action of the auxiliary spring after the initial movement of the frame, substantially as set forth.

947,406. Clutch and Transmission Mechanism. John C. Carpenter, Houston, Tex. Filed March 16, 1909. Serial No. 483,695.

1. In a clutch and transmission mechanism, the combination of a chamber having a fluid port; a movable fluid displacing member acting within said chamber; driving and driven members operatively connected, one with said chamber and the other with said fluid displacing member; a sliding valve for said port; a valve seat; a guide for said valve, said guide being inclined toward said valve seat.

947,442. Tire. William D. Harris, Philadelphia, Pa., assignor to Harris Tire & Rubber Co., Philadelphia, Pa., a Corporation of Maine. Original application filed Feb. 2, 1907, Serial No. 355,472. Divided and this application filed April 26, 1907. Serial No. 370,429.

A tire consisting of a body of rubber, a mass composed of a series of long substantially parallel vegetable fibers embedded in said rubber in a relatively compact body, said fibers extending independently of each other and lying substantially perpendicular to the wearing surface of the tire.

947,477. Shock Absorber. Ernest C. Wilcox and Burton L. Lawton, Meriden, Conn. Filed Nov. 11, 1909. Serial No. 527,373.

1. A shock absorber, comprising two relatively rotatable parts, one part comprising a cam, the other part comprising a case surrounding and supporting said cam, a lever carried by each part and projecting laterally therefrom, said cam having a plurality of high points, a corresponding number of springs arranged and held within the case, each spring bearing against said cam between two of said high points and arranged to be operated by both of said high points.

# KOEHLER "40"

## \$1650 — Torpedo

H. J. KOEHLER & CO., 1709 Broadway, New York

# THE MARMON

"The Easiest Riding Car In The World"

A Vanderbilt Winner.

## PROMOTING AN INDEPENDENT SHOW

**Man from Troy Leases Grand Central Palace and is Busy Seeking Support—  
Dates Already Selected.**

After all, there will be an "independent" show in Grand Central Palace, New York, next winter.

The opportunity created by the dissolution of the American Motor Car Manufacturers' Association, which fathered the previous shows in that building, was too good to be resisted, and C. C. Conant of Troy, N. Y., is the man who has thrust himself into the breach. He is at present in the West engaged in seeking the support of and in "signing up" car manufacturers who are still outside the Selden ranks, and such accessory makers as he is able to enlist.

For his venture, Conant, who is connected with the Carriage Dealers' Monthly, and who has had a hand in the promotion of carriage shows, has leased Grand Central Palace for the week beginning January 31st next, which corresponds with the period of the American Motor Car Manufacturers Association's last show held there this year and which will be one week previous to the licensed show in Madison Square Garden. Conant, however, will not conduct the show under his own name, it being his intention to incorporate a company or "association" for the purpose.

When Alfred Reeves, general manager of the Association of Licensed Automobile Manufacturers, was asked whether that organization would take any action in the matter, he declined to commit himself, but he did remark that exhibiting at such a show would automatically serve to bar the exhibitor, whether of cars or accessories, from not only the Garden show but from those in Chicago and Boston as well.

### No Cut-tailment of Gasolene Supply.

Published reports that the Standard Oil Co. had issued notice that after April 15th

it would be unable to supply better than 64° gasolene except in the larger cities, are vigorously denied at the headquarters of the company, 26 Broadway, New York. When a Motor World man sought information there, J. I. C. Clarke, the Standard Oil publicity man, after consultation with the Industrial Department, denied that the company had done anything of the sort.

"The Standard Oil Co. has sent out no notice that it would make any change in the quality or grade of gasolene at any point its supply reaches," said Mr. Clarke. "It intends to furnish gasolene of proper quality to all users as it has done in the past."

### Ford Figuring on Eastern Warehouse.

Reports that the Ford Motor Co., of Detroit, was preparing to erect an eastern factory in Long Island City, N. Y., and had acquired a site for the purpose, are not wholly correct. What the Ford company is doing is negotiating for a site in Long Island City at the terminus of the Williamsburg bridge, which connects it with New York City. The land is owned by the Pennsylvania railroad, but the city has viaduct rights which must be waived before the Ford people can get a clear title to the property; this has delayed the consummation of the negotiations, the final papers not yet having been signed. When the knot is unraveled, and regardless of what the future may develop, it is the immediate intention of the Ford company to erect not a factory, but a big warehouse on the site.

### Brooks Buys into the Rothschilds.

Emerson Brooks, for 20 years vice-president of the body building house of J. N. Quinby & Co., Newark, N. J., has severed his connection with that firm and purchased a half interest in the Rothschild Co., of New York, of which he has become president and general manager. Brooks, who has been identified with automobiling since its very earliest day, states that the Rothschild business will be broadened and the connection with the body-building Rothschilds, of Paris, strengthened.

## NORWALK HAS A NEW "NEIGHBOR"

**It "Loves" the Dealer Like He "Loves" the Owner—Investigation Develops Interesting State of Affairs.**

What the cut-price automobile "leagues" and alleged "discount houses" profess to do for owners, now is to be done for the dealers, according to the general argumentative drift of an enterprise known as the Economy Distributing Co., of New York City, which is sending saffron tinted bargain sheets to dealers in various cities, and the real ownership of which is full of interest.

After reciting the cruelty of the jobbers toward the dealers, the Economy company sets forth that it "intends to sell as large a variety of standard automobile supplies as possible, direct from the factory to legitimate dealers at the same price as these supplies are being sold to the jobbers, and if this co-operative organization meets with the support from the dealers that it has the right to expect," it will be able to sell more lines of goods on this basis than is at present possible for it. "Remember," the exhortation concludes, "we sell only to dealers, not to automobile owners."

If the Economy Distributing Co., as such, does not sell to automobile owners, it nevertheless has a very near and apparently dear neighbor that does so—and at cut prices, too. The address of the Economy company is given as 99 Chambers street, while the fragrant 35 Per Cent. Automobile Supply Co., of which A. B. Norwalk is the moving spirit, is at 97 Chambers street, so close, in fact, that several New York tradesmen handling accessories in a wholesale way are not able to distinguish one company from the other. The Economy company also evinces a great leaning toward a number of knickknacks and specialties that heretofore have been more or less characteristic of Norwalk's activities.

When a representative of the Motor World called at the Economy company's ad-

dress, he was not quite sure whether he had gotten into a salesroom or a loft. It is located on the fourth floor, and there is little evidence tending to show that any considerable stock is carried. Two tables on which some small wares are displayed and some lamps and ignition appliances, are all there is to be seen. A tow-headed young man in charge, when asked to sell a box of cotter pins and a wrench, first somewhat cautiously inquired if the would-be purchaser was a dealer. Being assured that he was not, but merely an owner of a runabout, the Economy man remarked that as the "boss" was not present, he could not take the chance of making such a small sale, but that if the purchaser would leave an order for some \$50 or \$60 worth—why, then the company would be glad to furnish him the desired materials.

Then, as though a bright idea had struck the salesman, he inquired with some interest: "Have you been downstairs at the 35 Per Cent. place?" The Motor World man responded in the negative and received the information that the "35 Per Cent. place" would gladly sell him anything he wanted in the accessory line, in fact would sell some things cheaper at retail than the Economy company could sell them at wholesale. Getting somewhat mixed up in his prices, the young man added that cotter pins would only cost 10 cents a box downstairs, while he had to charge 70 cents a dozen boxes at wholesale. Obviously, he failed to see the humor of this remark.

He then proceeded to talk about the electric appliances exhibited, and offered to sell any and all of them to the inquirer at wholesale prices, stating that on electrical goods no arrangement existed between the Economy company and the manufacturers in regard to the selling to "dealers only." He also somewhat casually mentioned the fact of having exhibited at the Madison Square Garden Automobile Show, though the complete list of the automobile show exhibitors is silent about it.

Urged once more to "try the people downstairs," the Motor World man left and entered the 35 Per Cent. Automobile Supply Co.'s store, and asked for a "B. & S." wrench of a certain type. He was handed a rather poor imitation of this tool, stamped "B. & C.", for which he paid 40 cents. The similarity of the wrenches, except in quality, and the still more confusing letters stamped on the imitation, were so flagrantly unfair, that the buyer returned the wrench about ten minutes later as not being the kind he asked for. The salesman assured him that the B. & C. was "just as good," etc., but returned the purchase price when it was demanded.

#### Barkman Goes up Another Round.

A. B. Barkman, who has been with the Maxwell-Briscoe Motor Co. since 1906, has been appointed the sales manager of that concern. Until his new appointment he was a district sales manager.

## MORE MERGER RUMORS REPUDIATED

Winton and Briscoe Both Deny Alleged "Inside" Information—The Motor World Offers a Suggestion.

Having during the past three weeks connected the Chalmers and Ford companies with one or the other of the merger movements now in progress in the industry, the Detroit rumor mongers got busy last week and set afloat the story that the Winton company was about to link itself with the United States Motor Co. One of the automobile publications swallowed it hook, line and sinker, and even intimated that the information came from the inside of the Winton establishment. The Winton company itself, however, promptly repudiated the report and branded it as unfounded and when seen by a Motor World man President Briscoe, of the United States Motor Co., did likewise. He stated that while his company was negotiating with certain manufacturers, the Winton company was not one of them.

In order to save time, false reports and repeated inquiries and denials, all manufacturers desiring to record permanent denials of probable connection or pending connection with merger movements will please inscribe their names here:

All those who are engaged in negotiations or who are likely to, or desire or hope to enter mergers will sign here:

#### Norwalk Offers a New Bait.

A. B. Norwalk, who operates as the 35 Per Cent. Automobile Supply Co., and who in doing so has done not a few peculiar things, has grown generous. He intends to "give my customers an opportunity to share in the profits" of his business, to use his own words. In this guise of a Greek bearing gifts, he will gently swell the capital of his institution from \$100,000 to \$150,000, and then open his heart and "place the increase with 500 or more customers who are in harmony with this business." Norwalk tells his "harmonious customers" something about his profits, but he says nothing about how he made them. "I have succeeded in overcoming the prejudice of manufacturers against price-cutting," is not the least remarkable of the statements he

makes in his effort to induce his "harmonious customers" to walk into his stock-selling parlor. He does not, however, guarantee the truthfulness of his assertion and probably would not make affidavit to it.

#### Detroit Companies Extending Themselves.

Increases of capitalization are proving more or less epidemic among the Detroit makers, the Hupp Motor Car Co. having raised its capitalization from \$50,000 to \$250,000, and the Anhut Motor Car Co. from \$150,000 to \$300,000, while the Regal Motor Car Co. has increased from \$100,000 to \$1,000,000. The Hupp company has announced the institution of a selling campaign in Europe, and indicates that it will send C. H. Dunlap, assistant sales manager, to Brussels and Berlin to exhibit the Hupmobile at the expositions in those cities and to establish selling agencies in the principal European capitals. The Anhut company is to take over the plant of the Chatham Motor Co., of Chatham, Ont., and enter the Canadian manufacturing field.

#### Will Continue to Produce Petrels.

Disclosure has been made as to the real purchasers of the plant of the bankrupt Petrel Motor Car Co., of Milwaukee, Wis., which was sold by the referee on the 23d ult., the new owners being the Filer & Stowell Co., at Ziemer and Becher streets, Milwaukee. It is announced that the plant will continue to make cars, the business being carried on with such improvements and new features as seem desirable. Following the sale, the referee has declared a first dividend of 15 per cent. to the creditors.

#### Dowse Leaves Tires to Sell Cars.

Ralph P. Dowse, manager of the G & J Tire Co.'s Detroit branch, has resigned that position, and in conjunction with L. H. Christian has taken over the southwestern representation of the Car Makers Co. of Chicago, and will in the future handle the product of the factories producing the Anhut, De Tamble, and Cutting motor cars. The new company will operate from Kansas City as a base, and will have the distribution of these lines throughout the whole of the southwest.

#### New Home for Fisk's Boston Branch.

The Fisk Rubber Co., of Chicopee Falls, Mass., is to have a five-story building in Boston, Mass., on Boylston street, next the corner of Fairfield street. The property on which it is to stand has been bought by new owners, and the Fisk company has taken a 20-year lease on the structure which will be erected for it.

#### Nebraska Maker Erecting a Plant.

The Rogers Motor Car Co. has commenced the erection of a plant in Ralston, Neb., and expects to make such rapid progress as to have one hundred cars on the market by July 1st. The Rogers company will produce runabouts and surreys.

## EXPORTS UP TO BOOM PROPORTIONS

**February Shipments Attain a Value of Nearly \$900,000—Canada Biggest Buyer and Gains Made in All Directions.**

With Canada alone taking \$357,797 worth of cars in four weeks and all the other divisions on the geographic list without a single exception showing enormous gains, the month of February was one of the best ever known to the American export trade in automobiles. The shipments of cars and parts for the month aggregated \$883,323, as against \$391,806 in February a year ago, an increase of \$491,517, or 125 per cent. for the one month. The cars numbered 561, as against 208.

By reason of the heavy flow of American machines into British North America, that division has far outdistanced the United Kingdom as the heaviest outside buyer and has exceeded its own record of February, 1909, when it bought to the extent of \$105,993, by an increase amounting to \$251,804. The United Kingdom is second on the list, however, with \$150,457, as against \$89,026 last year, while Italy is third, with \$81,093 as against \$63,158 in the previous February.

Like the record for the month alone, the figures for the eight months ending with February reveal that every foreign market into which American cars are being sent has increased its purchases for the period. Here again British North America is in the lead, with \$1,985,601, as against \$773,895 for the same months of 1909, but it is more closely pressed by the United Kingdom, which has a total of \$1,210,921, as against \$771,350. Mexico stands third and France fourth in the summary, the West Indies taking fifth place.

The total for the eight months was \$5,374,884, as against \$2,663,355 for the eight months of the previous year; while the cars numbered 3,429 as against 1,249. Among the heaviest gains are those disclosed by the West Indies and Bermuda, British Australasia, Germany and by Other Asia and Oceania. The record in detail is as follows:

	February		Eight Months Ending February			
	1909	1910	1908	1909	1910

## Regal Starts Work on Huge Factory.

The Regal Motor Car Co., Detroit, which recently purchased a block of property at Piquette and Harper avenues in that city, has commenced the erection of a huge plant thereon. It will be built in two sections, the first of which, 582x167 feet, already is under way. It will be a concrete, brick and steel structure, a feature of which will be a circular driveway on both the first and second floors of the plant, which will be large enough to permit the use of a big power truck loaded with materials. A quarter mile testing track with banked curves also will be built; in fact, work on it already has been commenced.

## Still Adding to Goodyear Plant.

The Goodyear Tire & Rubber Co., which last year increased its floor space 50 per cent. has let contracts for the construction of additional buildings which will enlarge its Akron plant another 125 per cent., or more than 300,000 square feet. The plant then will cover 12 acres. All of the buildings are of steel and concrete fire proof construction. Among other things, the Goodyear company now has in course of erection, for the needs of its power plant, one of the largest smokestacks in the country; when completed it will be 250 feet high and 12 feet in diameter.

## To Make Radiators by New Process.

The Electrolytic Products Co., of Buffalo, which has been incorporated under the laws of New York with \$100,000 capital, has in view the manufacture of automobile radiators by an electric method which, it is asserted, is likely to revolutionize the manufacture of such articles. The directors of the company, which has not yet secured a plant, are Frank A. Abbott, Henry C. Struel and Joseph Prozel.

## Warner Opens Kansas City Branch.

The Warner Instrument Co. has opened still another branch house, this time in Kansas City, at 1613 Grand avenue. It is in charge of H. A. Reifenberg, who previously was connected with the Warner branch in Detroit.

## LUBRICATOR PATENT SUSTAINED

**McCord Wins Suit Against Lavigne and Prepares for a General Campaign—Feature Covered by Patent.**

Having obtained a decision sustaining their lubricator patent, No. 822,900, the McCord Mfg. Co., of Detroit, are making ready to wage legal warfare all along the line, the patent being claimed to be of a more or less basic nature.

The patent was upheld by the United States Circuit Court for the Northern District of Illinois in the suits for infringement brought by the McCord company against the Lavigne Mfg. Co., of Detroit, and Brandenburg & Co., of Chicago and New York, who handle the Lavigne lubricators. The court declared that the patent had been infringed and ordered an injunction to issue against both these defendants.

The patent involved applies to means of regulating and indicating the operation of the pump extending from the inside of the reservoir through the cover, a system which the McCord people assert is used in practically every force feed lubricator on the market. Fortified with the decision in the Lavigne case, they therefore announce that they shortly will institute actions against the other manufacturers who, they allege, are infringing their rights.

## Pioneer to Remove to Oklahoma City.

The Pioneer Car Co., of which W. R. Roberts is president, and which has produced a number of automobiles in a plant in El Reno, Okla., has succumbed to the blandishments of Oklahoma City and is preparing to pull up stakes and remove to the latter place. The present capital of the company, \$20,000, will be increased to \$50,000, one-half of which will be subscribed by residents of Oklahoma City. A plant, 125x156 feet, will be erected on a site which has not been definitely selected. According to the stories from Oklahoma, the Pioneer company has obtained a Selden license, although its name is not included in the list of official licensees, which most recently was issued.

## Lozier of Michigan Elects Officers.

The Lozier Motor Co. of Michigan has completed its organization by the election of the following officers: Henry A. Lozier, president; Gilbert W. Lee, Fred C. Chandler, vice-presidents; Cyrus E. Lothrop, secretary; Charles H. Hodges, treasurer. In addition to these officers the directors are Edwin R. Lozier, Lewis H. Jones, E. D. Stair, George G. Booth, Willis Buhl, Harry M. Jewett, Sherman Depew, Samuel Regar, John G. Perrin, Charles A. Emise, Arthur F. Way, Edward F. Flammer, John M. Wever, George F. Tuttle and Hugh Herndon.

**THE WEEK'S INCORPORATIONS.**

Caro, Mich.—Thumb Auto Co., under Michigan laws with \$12,000 capital.

Chicago, Ill.—George G. West Livery Co., changes name to West Motor Livery Co.

Kittaning, Pa.—Kittaning Automobile Co., under Pennsylvania laws, with \$5,000 capital.

Bayonne, N. J.—Goodman's Motor Express, Van and Storage Co., under New Jersey laws, with \$25,000 capital.

Athens, O.—Athens Automobile Co., under Ohio laws, with \$10,000 capital. Corporators—A. F. Larheard and others.

Jersey City, N. J.—Rubber Exploration Co., under New Jersey laws, with \$50,000 capital; to manufacture rubber goods, etc.

Jersey City, N. J.—Tate Gas-Electric Vehicle Co., under New Jersey laws, with \$100,000 capital; to manufacture motor trucks.

Aberdeen, S. D.—Union Implement & Transfer Co., under South Dakota laws, with \$10,000 capital; to deal in implements and automobiles.

Minneapolis, Minn.—Northwestern Overland Co., under Minnesota laws with \$10,000 capital. Corporators—W. J. Bowman, R. A. Creek and others.

Baltimore, Md.—Auto Trading & Garage Co., under Maryland laws. Corporators—Philip Wenchel, Jacob Bauman, W. H. Schweizer, F. W. Lilly.

Wilmington, Del.—Towanda Automobile & Novelty Mfg. Co., under Delaware laws with \$200,000 capital. Corporators—G. W. May, A. Smith, G. Turner.

Weatherford, Tex.—Texas Auto Co., under Texas laws with \$8,000 capital. Corporators—G. M. Bowie, C. A. Jones, B. F. Cherry and C. C. Littleton.

San Antonio, Tex.—Texas State Association, under Texas laws, no capital. Corporators—R. W. Carr, C. C. Cresson, San Antonio; E. H. R. Green, Dallas.

Brooklyn, N. Y.—Fulton Auto Garage Co., under New York laws, with \$5,000 capital. Corporators—Charles E. Van Sise, John T. Sullivan, Andrew M. Madigan.

Moline, Ill.—Plow City Garage, under Illinois laws with \$5,000 capital; general automobile business. Corporators—Fred R. Young, W. R. McClean, J. M. Johnston.

Indianapolis, Ind.—Star Starter Co., under Indiana laws with \$75,000 capital; to manufacture automobile parts. Corporators—C. R., G. A. Webber, G. G. F. Boswell.

Pittsburg, Pa.—Globe Garage & Auto School, under Pennsylvania laws with \$10,000 capital. Corporators—D. P. Reighard, A. J. Schmitz, Ralph R. Nowlen.

Brooklyn, N. Y.—S. & V. Motor Co., under New York laws, with \$10,000. Corporators—William H. Varley, James W. Saitta, Brooklyn; George A. Baker, New York City.

East Liverpool, O.—Auto Supply Co., under Ohio laws with \$10,000 capital. Corporators—W. B. Hill, G. C. Thompson, W. T. Tebbutt, L. C. Hedaleston, W. A. Hobbs.

Cambridge, Mass.—Taxacab Co. of Cambridge, under Massachusetts laws with \$25,000 capital; automobile business. Corporators—S. J. Moran, Allston; W. P. Barnhart, Cambridge.

Utica, N. Y.—Oneida Garage Co., under New York laws, with \$1,000 capital; general automobile business. Corporators—H. S. Powell, Frank Bowen, Hugh T. Foulks, William Hughes.

Greenwich, Conn.—Mutual Garage Co., under Connecticut laws with \$4,000 capital; general automobile business. Corporators—H. G. Williams, A. W. Klein, J. A. Clarke, T. J. Egan.

Windsor Locks, Conn.—Windsor Locks Auto Co., under Connecticut laws, with \$3,000 capital; general automobile business. Corporators—H. L. Cutler, H. R. Coffin, William Robertson.

Buffalo, N. Y.—Electrolitic Products Co., under New York laws, with \$100,000 capital; to manufacture automobile radiators, accessories, etc. Corporators—H. C. Steul, F. A. Abbott, J. Porzel.

Toledo, O.—Mutual Auto & Garage Co., under Ohio laws, with \$5,000 capital; general automobile business. Corporators—E. E. Sheppard, Charles A. Langdon, Charles E. Holt, Alvin C. Jones.

New York, N. Y.—Washington Garage Co., under New York laws with \$5,000 capital; to build, deal in and operate garages, etc. Corporators—Nicholas and Barbara Grunzfelder, August Welsing.

Racine, Wis.—Kelly-Racine Rubber Co., under Wisconsin laws with 3500,000 capital; to manufacture vehicle tires of all kinds. Corporators—Charles F. U. Kelly, William M. Lewis and James W. Gilson.

Rensselaer, Ind.—Rensselaer Garage, under Indiana laws, with \$2,000 capital; general automobile business. Corporators—Granville Moody, A. R. Kresler, E. C. English, R. A. Parkinson, John Marlatt.

Chicago, Ill.—Mercury Motor Co., under West Virginia laws, with \$200,000 capital. Corporators—Walter H. Jacobs, Arthur C. Marriott, Jesse B. Hawkes, Sydney A. Cryor, John C. Slade, all of Chicago.

Auburn, N. Y.—Auburn Ignition Mfg. Co., under New York Laws, with \$25,000 capital; to manufacture and deal in automobile appliances, etc. Corporators—T. J. and D. M. Winans, C. J. Knapp, all of Binghamton.

Muncie, Ind.—Muncie Gear Works, under Indiana laws with \$250,000 capital; to manufacture automobile parts, etc. Corporators—H. L. Warner, D. O. Skillen, G. H. Guthrie, John McPherson and F. F. McClellan.

New Orleans, La.—Fairchild Auto Co., under Louisiana laws, with \$1,000,000 cap-

ital; to manufacture and deal in automobiles, etc., and to operate garages. Corporators—L. H. and E. H. Fairchild, S. J. White, F. C. Bowlus.

New Brunswick, N. J.—Williamson Garage Co., under New Jersey laws, with \$50,000 capital; general automobile business. Corporators—W. M. Williamson, New Brunswick; N. H. Smith, J. B. Buckalew, Jersey City.

Trenton, N. J.—Harmer Rubber Reclaiming Works, under New Jersey laws, with \$125,000 capital; to reclaim rubber and manufacture rubber goods. Corporators—Joseph Gordon, Hyman A. Rosenthal, Thomas W. Harmer.

Jersey City, N. J.—Scherl Monorail Co., under New Jersey laws, with \$125,000 capital; to manufacture automobiles, monorail cars and other cars, etc. Corporators—A. L. O'Shea, J. W. Hertzler, New York City; T. Renwick, Greenville.

West Orange, N. J.—The Sauer Motor Trucks, under New Jersey laws, with \$1,000,000 capital; to manufacture and deal in motor vehicles. Corporators—William D. Sargeant, West Orange; George M. Judd, Edward H. Fallows, New York City.

New Rochelle, N. Y.—Bluebird Motor Cab Co., under New York laws, with \$40,000 capital; to manufacture, rent and deal in automobiles, motorcycles, etc. Corporators—J. K. Robinson, Jr., T. H. Bridgman, Pelham Manor, N. Y.; E. W. Wilson, New York City.

New York, N. Y.—American Taximeter Co., under New York laws with \$200,000 capital; to manufacture and deal in materials for electrical engineers, etc. Corporators—Vincent C. King, Junior A. Straussman, New York City; Agnes A. Meschutt, Ridgewood, N. J.

New York, N. Y.—Amateur Automobile Contest Association, under New York laws, to promote automobile contest sports. Corporators—Northrop Fowler, R. M. Jesup, H. H. Law, John Rutherford, J. D. Tooker, Clarence M. Chauncey, Charles A. Fowler, Jonathan Thompson, J. Tilbert Wilson.

**Increases in Capitalization.**

St. Louis, Mo.—St. Louis Taxicab Co., from \$17,000 to \$50,000.

Chicago, Ill.—Pfanstiehl Electrical Laboratory, from \$50,000 to \$75,000.

Springfield, O.—Oscar Auto Co., decreased from \$300,000 to \$100,000.

El Reno, Okla.—Pioneer Co., from \$20,000 to \$50,000 and removes plant to Oklahoma City.

Detroit, Mich.—Anhut Motor Car Co., from \$150,000 to \$300,000, and takes over the Chatham Motor Car Co., Chatham, Ont.

Detroit, Mich.—Regal Motor Car Co., from \$100,000 to \$1,000,000. American Automobile Trimming Co., from \$10,000 to \$30,000. Detroit-Dearborn Motor Car Co., from \$50,000 to \$100,000.

## IN THE RETAIL WORLD.

Grice & Volkman, Antioch, Ill., have opened a garage in that town.

The Glide Auto Co., Waterloo, Ia., is having plans drawn for a new garage.

Holoway & Buehler, Monroe, Wis., have sold their garage to Patterson & Keil.

Walters & Whittig, Hartford, Wis., are preparing to open a garage in that town.

The Maxwell-Briscoe Automobile Co., Sioux Falls, S. D., has "opened up" in that town.

E. D. Waterbury, Amity, N. Y., has raised the town's valuation by the erection of a garage.

Miami, Fla., is to have another new garage. Henry Wehs will build it near the Shannaban mansion.

Ohioville, N. Y., is all worked up over the erection of its first garage; Murlin Abrams is the proprietor.

F. B. Stumpf, Eureka, Ill., has swelled the local tax list by the erection of a garage. He will feature renting.

Carl Lewis, Ainsworth, Neb., has acquired a half interest in W. F. Smith's garage. The firm name will be Lewis & Smith.

F. A. Crecelius, Waterloo, Ia., has disposed of his interest in the Waterloo Auto & Supply Co. to Albert Farrand.

The Peters-Rockwell Motor Co., Waterloo, Ia., has dissolved partnership, and A. H. Peters will continue the business.

C. H. Minchin, Port Chester, N. Y., has a new garage "in the works" on Mason street. It is a two story brick structure.

Memphis, Tenn., is to be honored with a Buick branch which will be located at 59 South Second street. Louis Woods will be manager.

Work will be begun at once on a brick garage for J. A. Ford, Bridgeport, Conn., on Stratford avenue. It will be one story, 46x89 feet.

Fike & Groat, Lewiston, Ill., have embarked in the automobile business in that place; they are erecting a garage near the Fair store.

Trenton, N. J., is to have another new garage, to be erected by John H. Ashton, at 227 North Broad street. It will be a three story affair.

James Napier, Franklinville, N. Y., has purchased the Deibler lot on Church street and will erect a garage on it. It will be a two story building, 80x120 feet.

The Auto Trading & Garage Co., Baltimore, Md., has opened an establishment at North avenue and Oak street. It will act as distributor for Washington cars.

The Philadelphia Reconstruction Co., Scranton, Pa., has entered the local automobile field with quarters at 227-29 Raymond court. It will exploit Velie cars among others.

Cullen-Butler Auto Co., Memphis, Tenn., have joined the rapidly growing motor col-

ony on Monroe avenue, the local "row." Their new home is 75x150, and is built of concrete.

The Tanberg Auto Co., Eau Claire, Wis., has opened a branch at Chippewa Falls, at 203 Bridge street. It has an extensive line, among them being the Peerless, Winton and Waverley.

L. G. de Escandon, Trenton, N. J., has leased the repair shops at the Leader garage, which have been vacant for some time, and is prepared to prescribe for all ills to which motor cars are heir.

Twist & Driscoll, Trenton, N. J., have removed to their new and modern garage on South Clinton street. They are the Mercer County agents for the Mitchell, American and Hupmobile lines.

The Scranton (Pa.) Motor Car Co., is the title of a new firm which has begun business in that city on North Washington avenue. In addition to an agency business they also will specialize on repairing.

H. B. Smith, Caro, Mich., who handles the Ford, has acquired an interest in the Thumb Auto Co., and has merged his business with it. He will be manager of the concern, which is building a new garage.

Lundvall & Olsen, Mount Vernon, N. Y., have taken over on a ten years lease, the Mount Vernon Auto Station formerly operated by C. A. Stephenson. Both of the new proprietors have had ripe experiences.

The Wilcox-Clemens Auto Co., Indianapolis, Ind., has opened showrooms at 309 North Pennsylvania street, where Speedwell and Clarke cars will be handled. R. A. Wilcox and Jap Clemens constitute the firm.

Fire caused by the explosion of gasoline made merry in the Lozier Motor Co., Boston, Mass., garage, on the 1st, causing a loss of \$100,000. Twenty-five cars were destroyed, several of which belonged to private owners.

The automobile colony of Hartford, Conn., has been swelled by the entrance in the local field of the New England Garage Co., with show rooms at 232 Main street. It has undertaken to introduce the Cutting to Hartfordites.

The Dyersville (Ia.) Automobile Co. has commenced its business career in a new garage just completed for it. It is a one story brick building, 44x115. Jacob Friedman, formerly of Marshalltown, is manager of the concern.

The Buffalo (N. Y.) Republic Tire branch will be located at 908 Main street after May 1. Contrary to the impression which the name conveys, the establishment is not devoted to tires exclusively, but Jackson and Whitney cars also are marketed.

Work soon will be begun on the new garage to be erected for the Fawkes Auto Co., Minneapolis, Minn., at Hennepin avenue and Erie street. A novel feature of the establishment will be the fitting up of the basement as a warehouse.

The Fort Wayne Vulcanizing Works, Fort Wayne, Ind., and the Burwell-Smith Auto Supply Co., Oklahoma City, Okla., have been designated general distributing agencies by the Firestone Tire & Rubber Co. They will carry complete stocks of all Firestone tires and rims.

Work has been commenced on the new home of the Ford Atlanta (Ga.) branch at 311-313 Peachtree street, the premises having been leased by Ford for a long term. It will be one of the handsomest automobile sales rooms in the South, being built of white brick, and will cost \$25,000.

The Toledo-Regal Sales Co., Toledo, O., has been formed to take over the agency business of W. S. McMurray, on Jefferson avenue, and will exploit the Regal throughout northwestern Ohio. McMurray heads the new concern and associated with him are H. J. Chittenden and A. L. Trautwein.

The Abbott-Detroit Motor Car Co. of Pennsylvania, Philadelphia, Pa., is the corporate title of a new concern which has "opened up" at 441 North Broad street, where Abbott-Detroit cars will be exploited. V. P. Padula, the "mainspring" of the new enterprise, is a well known figure in the local trade.

On May 1 the New York branch of the G & J Tire Co., for many years located at 10 West Sixtieth street, will remove to 1924 Broadway, near 64th street. In addition to being more conveniently situated, the new quarters, which now are occupied by the Atlas Motor Car Co., will afford much more "elbow room."

Supplying a long felt need in local circles, the Oklahoma Motor Equipment Co., Oklahoma City, Okla., has commenced business at 310 North Broadway. L. E. Allmon and J. A. Carlson are the powers that be in the new enterprise, which will do a wholesale and retail business, and is preparing to establish a chain of agencies throughout the state.

The Utah Motor Co., and L. J. Gilmer Co., Salt Lake City, have been merged under the title of the Utah Motor Car Co. For the present the Gilmer quarters at 225 South West Temple street, will be maintained, but new show rooms at 127-29 South State street, will be occupied early in April. The same lines as heretofore, will be carried, consisting of the Cadillac, Packard, American and the Detroit electric.

Fire gutted the establishment of the Capital City Auto Co., 176-186 Allyn street, Hartford, Conn., on the 2d inst., destroying twelve machines and badly scorching several others, and causing a loss of about \$25,000. Carelessness in filling the gasoline tank of a car without extinguishing the lamps, caused the ignition of the vapor, and the interior of the building was a mass of flame in an instant. The building, a one story frame structure, was badly damaged. Most of the machines burned were Mitchells, which make the Capital City concern represents.

# The easiest-riding Car in the World

IS THE

# WHITE STEAM CAR

The White Steam Car has many desirable qualities which are not equalled in any other type of car. At all times and under all conditions it is noiseless, absolutely free from vibration, smokeless and odorless. It is easiest on tires. It has unequalled hill-climbing ability. The engine can never be "stalled." It is by far the easiest car to control and it is, therefore, the safest car for passengers as well as for other users of the highway. Either kerosene or gasoline may be used as fuel.

The development of the White Steam Car—the perfection of details, simplification of parts, etc.—has gone on steadily from year to year. As a result, the 1910 White Steamer represents as great an advance over the steam car of a few years ago, as does the 1910 White Gasoline Car compared with gasoline cars designed several years ago.

During the last nine months—from July 1st to date—more White Steamers have been made and delivered to customers than in the corresponding period of any previous year.

---

Are you familiar with the many desirable features of the 1910 White Steam Car? A postal to us brings a copy of our catalog.

**Possibilities of Fuel Injection.**

Air may be looked upon as the true working fluid upon which the performance of the internal combustion engine depends. The air is energized in consequence of the process generically known as combustion but ordinarily termed explosion, which results in raising it to a high temperature. The essentials to this process are, first, a charge of air; second, a combustible gas, and, third, a means of ignition. Regarded in this way, there is no apparent reason why it should be necessary to go through the elaborate and difficult process of carburetting the air prior to its introduction into the cylinder. Were the air and the fuel vapor of more nearly equivalent properties such might not be the case; they are not, however, and the fact remains that the single word carburation, which may be spoken very glibly indeed, in its ordinary acceptance includes the triple process of atomizing the fuel, vaporizing it, and subsequently mixing it with a suitable proportion of

air. Furthermore, it is a process the complexities of which are rendered doubly irreconcilable—or so it seems—by the widely varying conditions under which the engine is called upon to perform.

Just at this stage of the analysis the advantages of the fuel injection plan loom pretty large. Since heat is essential to the vaporizing process, since there is a superabundance of heat inside the cylinder during the idle strokes of the common cycle, and since there is no inherent reason for completing the carburetting process before the instant of ignition, it is possible to look upon the average carburetter as a somewhat crude and unnecessarily complex device for accomplishing a perfectly natural process. Nor is its cause materially strengthened when it is considered that despite the prodigious amount of effort which has been expended in perfecting it, the best examples of its class yet produced are open to recognized shortcomings and the performance of engines equipped with carburetters is by no means as satisfactory from the standpoint of efficiency as that which has been attained with those from which the carburetter has been eliminated.

But lest this be construed into a brief for fuel injection, either as a principle or as the basis of any one method of construction, it is to be observed that while there may be 300,000 or more cars in use to-day which are equipped with carburetters, none have been put upon the market as yet which are equipped with fuel injection systems. In other words, fuel injection as a principle has much to recommend it in a theoretical way, and judging by laboratory tests and the performance of the Diesel engine in large units, certain important practical advantages; but it remains to be put to the test of public usage. It contains many points of promise; its cause, as briefly reviewed, is alluring. But it involves such a novel interpretation of the principles of thermo-dynamics as compared with the standard product that it must be considered more as a hopeful prospect than as a substantial rival of the engine using carburetted gas. It should be given thorough investigation, even while the struggle with the carburetter problem is in progress.

**Danger that Lurks in Fly Wheels.**

Hitherto the annals of the automobile industry have been remarkably free from accidents caused by bursting fly wheels. But

it is by no means wise to ignore the existence of an agent possessing such tremendous potentiality for injury to life and limb, even though sheer good fortune or remarkable skill in design may have prevented a series of mishaps in the past. In reconstructing their motors in order to adapt them for succeeding models manufacturers have a habit of allowing one element or another to remain undisturbed, provided its original calculation called for strength considerably in excess of the requirements. The desire to accomplish manufacturing economies in this way furnishes the basis for stirring controversies between the engineering and producing departments sometimes, and occasionally results in expensive mistakes. Thus, increasing the power of the motor by a small amount has been known to result in repeated crank shaft breakdowns, bearings rapidly worn away or cut, or transmission gears and shafts stripped or bent, respectively, merely because proper allowance was not made for the added increment of power.

But in the case of the fly wheel it is not so much the result of slight increases in power which is to be feared as the growing demand for slow car speeds on direct drive. This requirement, coming as it does directly from the public, is being met as generously as possible, and whatever it implies in other respects, the tendency to develop engines producing high torque at low speeds throws an ever increasing amount of work upon the fly wheel. To steady the engine when running under load at low speed, considerably greater inertia effect is required of the fly wheel than when carrying the same load at higher speeds; the less frequent succession of impulses accounts for the difference. This implies the necessity of increasing the moving mass of the wheel either by increasing its effective diameter or by adding to the weight of the rim. But unless proper precautions are taken the limits of safety may be exceeded. Another factor, which is of weight in certain quarters, is the requirement for economy, which may tempt the designer to resort to low-grade castings for the purpose, or the assembler to set up his engines without thoroughly testing the fly wheel for flaws; even so, the risk of hidden flaws remains a more or less ominous cause of possible accident.

Already it has become known that one manufacturer has taken alarm from a series of accidents resulting to engines in the care

of his own employees. What might be the result were motors of the same class to be placed in the hands of the public, can only be imagined. But it is a fact to be deplored in this connection that there is nothing to prevent the ordinary operator from racing his engine to his heart's content; and it must be borne in mind that the centrifugal force which tends to rupture the fly wheel increases with the square of the linear velocity of the wheel. Therefore it is well to sound a note of warning just at this time, when the makers' effort is to increase the speed range of the engine. The balance wheel, which is sufficiently effective when the motor is pulling the car at three miles an hour on high gear, may become a positive menace at 60 miles an hour, unless it is of adequate strength.

### The Sad State of "Me and My Car."

Excepting the gentleman who occasionally masquerades under the alias Motor Contest Association, and whose sight is so bad that he cannot distinguish a genuine association from the other sort—and who really doesn't count—only one person has grown angry at the Motor World during the past week. He is Barney—Barney Oldfield; and Barney grew real mad, too.

En route from Florida to California, Barney dropped off at New Orleans long enough to get into print his opinion that the "Wright brothers are old ladies and Glenn Curtiss not much better," after which he boarded the train again and apparently went into the club car, where they sell hard stuff, and soft stuff, and there he dashed off another "hot one," and signed it with his real name—just like that! He struck off several copies and mailed one to each of those manufacturers whose cars, or tires, or magnetos, or ball bearings, or oil he condescends to use. He also mailed a copy to the Motor World, for the "hot one" relates to this publication. In it Barney modestly declares that he is "at the top of the ladder in my profession."

Barney tells the manufacturers to whom he mailed his missive that it is inconsistent for them to advertise "the performances of me and my car as the greatest in the history of the world" in the Motor World when the Motor World doesn't take Me as seriously as I take Myself. Therefore the Greatest in the World wants his name kept out of advertisements appearing in the Motor World, which would be, indeed, a tearful loss to the advertisers and to the Motor

World. And then, on the very heels of Barney's "hot one," there came a letter from one of the advertisers saying: "We also appreciate the fair manner in which you refer to our friend Barney Oldfield."

Barney's wrath appears to be due chiefly to the fact that the Motor World commended Chairman Butler, of the A. A. A. for blighting the crop of "made for newspaper consumption" "records" which he harvested previous to the Florida beach meet and there also has been a rankling in the Oldfield bosom because the Motor World on several occasions had timorously referred to his excursions into the woods with a troupe of his own selection as "barnstorming." He says it was racing, and as his car always overmatched those used by his compatriots, if not employees, that it was racing—of a sort—there can be no doubt.

Of course, if Barney were not the Greatest in the World and "at the top of the ladder," he would not be deserving of all this good editorial space. It is only truly great men who receive it and their idiosyncrasies are entitled to such notice. The public is interested in them.

Meanwhile if "Bill" Pickens can find time, he should take his illustrious charge to the brink of the Pacific and apply wet compresses to his brow for the better part of a day. It will prove good for what ails him and enable him to wear his hat without chafing. For his Florida exploits evidently caused a "rush" to the Oldfield head and he sadly is in need of attention. "Bill" also might call Barney's attention to the fact that his name does not appear in the A. A. A. official list of registered drivers—a lapse or neglect which in some sports might nullify records and lay even "me and my car" on the shelf for a more or less extended period, and cause manufacturers paying him stipends to write the Greatest Ever a few "hot ones" on their own account.

Buttons bearing the inscription "Revise the Wheel Tax" constitute one of the weapons which the Chicago Motor Club is using in its fight against the obnoxious and extortionate system of taxation which prevails in that city. From all accounts the buttons have not thrown much of a scare into the aldermen. The weapon that hits them hardest is the ballot, and if the Chicago club selects a couple of the gentry and marks them for defeat at the polls, it will save time, money and buttons and do good for all time.

## COMING EVENTS

April 6-9, Duluth, Minn.—Duluth and Superior Automobile Club's first annual automobile show in state armory.

April 7-9, Logansport, Ind.—Second annual automobile show in Broadway garage.

April 8-17, Los Angeles, Cal.—Inaugural meet on the new Los Angeles Motordrome.

April 9-16, Elmira, N. Y.—Elmira Chamber of Commerce's first annual automobile show.

April 11-16, Harrisburg, Pa.—First automobile show.

April 11-18, Springfield, Mo.—Springfield Chamber of Commerce's first automobile show.

April 18-23, Bangor, Me.—Second annual automobile show in Auditorium.

April 30, Philadelphia, Pa.—Quaker City Motor Club's third annual roadability run to Atlantic City.

April 30, Kansas City, Mo.—Automobile Club of Kansas City's hill-climb on Dodson hill.

May 2, Denver, Colo.—Start of Flag-to-Flag endurance and reliability contest to City of Mexico for Wahlgreen trophy.

May 3, Trenton, N. J.—Trenton Automobile Dealers' second annual 300 miles endurance run.

May 5-7, Richmond, Va.—Richmond Times-Dispatch endurance run.

May 5-7, Atlanta, Ga.—Opening spring race meeting on Atlanta motordrome.

May 9-11, Harrisburg, Pa.—Motor Club of Harrisburg's fourth annual reliability contest.

May 10-11, New York City—Motor Contest Association's reliability contest to Atlantic City and return.

May 13-14, New York City—Motor Racing Association's 24 hours race at Brighton Beach track.

May 18-19, Norristown, Pa.—Norristown Automobile Club's third annual endurance run to Scranton and return.

May 19-21, Hartford, Conn.—Automobile Club of Hartford's All-Connecticut reliability contest; 600 miles.

May 21-22, Brooklyn, N. Y.—Crescent Athletic Club-Long Island Automobile Club amateur touring contest on Long Island for Pardington trophy.

May 28, White Plains, N. Y.—Amateur Automobile Contest Association's hillclimb.

May 28-30, Indianapolis, Ind.—Grand Circuit meeting and national championship races on Motor Speedway.

May 30, Briarcliff Manor, N. Y.—Amateur Automobile Contest Association's hillclimb.

May 30, Bridgeport, Conn.—Automobile Club of Bridgeport's fifth annual hillclimb on Sport Hill, Easton.

## T. B. JEFFERY EXPIRES IN ITALY

Death Came Suddenly While on Pleasure Tour—His Remarkable Career as an Inventor and Manufacturer.

With startling suddenness, the cable on Sunday last flashed the news of the death in Grand Hotel, Pompeii, Italy, of Thomas B. Jeffery, the head of Thomas B. Jeffery & Co., Kenosha, Wis., and one of the most conspicuous figures in the American automobile industry. He died at midnight on Saturday, and as he had been in good health when he left New York in January, with Mrs. Jeffery, for a recreative tour of Europe, and as no intimation had been received that he had suffered illness of any sort, the announcement of his death was in the nature of a profound shock.

Thomas Buckland Jeffery was born at Stoke, Devonshire, England, on February 5, 1845. He came to this country at the age of 18 years and settled in Chicago.

Mr. Jeffery was married in 1874 to Miss Kate E. Wray, of Chicago. He also leaves two married daughters and two sons. He was a member of the Chicago Union League, Chicago Athletic and Chicago Automobile clubs, and a director of the Art Institute.

While the prominence of his firm and its product, the Rambler car, in itself made Mr. Jeffery a figure in the industry, his position was rendered more clear-cut by his attitude toward the Selden patent. He was one of the two "big" manufacturers who refused to recognize its validity and was the only one who held aloof from the "independent" association. He stood on such diplomatic middle-ground that there always existed hope that he would be "won over," and as a result he escaped being embroiled in the litigation that has followed in the wake of the patent, which, however, he followed with the keenest interest. When the testimony in the Ford case was being heard in New York, Mr. Jeffery was one of the most attentive listeners in the courtroom.

Shortly after the organization of the Association of Licensed Automobile Manufacturers, Mr. Jeffery, during the course of one of his occasional visits to the Motor World office, expressed his opinion of the situation. He considered that recognition of the Selden patent was good business insurance, but that the contract which licensees were required to sign was an almost impossible one and too greatly hampered freedom of action.

"It is easier to fight a patent than to break a contract," was the substance of his crystalizing conclusion.

After the decision adverse to Ford and in favor of the Selden patent was rendered, it for a time appeared likely that Jeffery & Co. would join the licensed ranks. There

is no doubt that Mr. Jeffery had serious debate with himself on the subject, but finally he told a Motor World man that the amount of royalty he would be required to pay could be as well used to pay for a good long lawsuit.

Despite his prominence in the industry, Mr. Jeffery was known personally to comparatively few of his fellow manufacturers. His firm was a member of none of the several associations and he himself was naturally quiet and reserved and self-contained. He was one of the finest listeners that ever lived. He had such remarkable control of his tongue that it is doubtful if anything he ever said got him into serious trouble. He always was well guarded in

THOMAS BUCKLAND JEFFERY

any opinion that might be drawn from him and used no unnecessary words in expressing it. Listening was his "specialty," and many a caller who prided himself on his ability as a talker has been reduced to such nervousness that he has backed out as gracefully as he knew how, simply because Mr. Jeffery let him talk himself to a standstill.

Before entering the automobile industry in 1900, Mr. Jeffery had made his fortune in the manufacture of bicycles, in which he was one of the real pioneers and a most conspicuous figure. In the late '70's he was a struggling inventor in Chicago, and in a small way was occupied with a railroad velocipede and similar appliances. In 1878 he visited England and, becoming interested in bicycles, he contracted for the necessary parts to assemble a number of the machines in this country. They did not arrive until the following year, and meanwhile Col. Albert A. Pope and the Pope Mfg. Co. had produced the first Columbia bicycle and soon thereafter acquired the Lallement patent covering the crank and pedal action. It was the Selden patent of that day and was but one of many of

which Col. Pope early became possessed. He promptly instituted suit against an alleged infringer and secured a verdict which required the infringer to obtain a Pope license in order to continue business. In 1881 Mr. Jeffery was engaged in the sale of cycle parts and soon afterward he and R. Philip Gormully, an English schoolmate of Mr. Jeffery who long had resided in this country, came together, and they began the production of boys' bicycles, which first were advertised in Gormully's name, Gormully defying the Lallement patent and in print declaring it to be worthless, while later Jeffery himself advertised for sale copies of the testimony in the infringement suit and offered to supply information to prove that the Lallement patent was public property. The formation of the firm of Gormully & Jeffery followed this procedure and peace with Pope was arranged and for a while Gormully & Jeffery operated under a Pope license, which restricted them to the production of youths' bicycles. In 1886, however, "war" broke out afresh. The Chicago firm issued a "declaration of independence" and Pope promptly responded by filing eight suits against them and by spreading "warnings" broadcast. Gormully & Jeffery fought back, and a year later the Pope interests were staggered by an adverse verdict—the first they ever had received. They carried the case higher and higher, but were beaten in every court. The doors thus were thrown wide open to all, and Gormully & Jeffery, who later became the Gormully & Jeffery Mfg. Co., swept on to fame and fortune.

Mr. Gormully was the financial and business man of the institution; Mr. Jeffery the inventor and producer. And if ever a man loved his factory it was Thomas B. Jeffery. He fairly lived in it. Even after he had attained affluence and during these later years when there was still less need for it, he constantly was roaming through his great plant, his eye taking in men and machinery alike and always seeking room for betterment. Mr. Jeffery was a fruitful inventor, but despite scores of patents issued to him both for bicycle and automobile devices, and notwithstanding the combative and tenacious nature of himself and his partner—who died in 1900—they rarely were the aggressors in patent litigation. The most conspicuous instance to the contrary concerned the patent on the clincher tire issued to Mr. Jeffery and of which the G & J tire of today is the lineal descendent, bearing the initials of the firm. The Jeffery patent was sustained in this country and imported clincher tires were driven off the market, but the Chicagoans were not content and carried the fight across the sea to their native land. There they were repeatedly beaten, but so tenacious were their natures that they took the case to the very House of Lords, the court of extreme resort, where they met final defeat, so far as Great Britain was concerned.

## THE MOTOR WORLD

In 1899 the Gormully & Jeffery Mfg. Co. was purchased for a princely sum by the American Bicycle Co.—the ill fated and so-called Bicycle Trust—and while Mr. Gormully remained a strong factor in the trust's affairs until the time of his death, Mr. Jeffery kept in the background—but not for long. The automobile had interested him and, to occupy his mind and, as he said, to provide for his two sons, then attaining to manhood, in 1900 he purchased at Kenosha, Wis., one of the many idle and abandoned plants of the Bicycle Trust, which had collapsed abjectly, and in which one of its finest bicycles had been produced. The firm of Thomas B. Jeffery & Co. then was organized and the Rambler car soon followed, the name Rambler being the same which had been borne by Mr. Jeffery's most famous bicycle. It did not take long for the man and his product to make an impress on the industry. His elder son, Charles, was trained to take care of the commercial affairs of the business, and for several years past the burden of the work has fallen on his shoulders. The younger son, Harold, was schooled in the factory itself, and thus the mantle of the father in large part has covered both sons. Although he never entirely removed his hand from the throttle, during recent years Mr. Jeffery himself has been given much to such travel as that which he was enjoying when death so suddenly overtook him.

### Original Air Tire to be Preserved.

J. B. Dunlop, inventor of the pneumatic tire, has presented the front wheel of the first pneumatic-tired bicycle to the Royal Scottish Museum of Edinburgh, where it has been allotted a conspicuous position. This interesting relic, the forerunner of a vast industry, was formally presented with considerable ceremony, during the course of which the suggestion of a monument to Mr. Dunlop was advanced. The tire, which is still in good condition, was made in 1888. The other, which has been lost, was sent to Paris in connection with legal proceedings, and there disappeared. The bicycle to which these original tires were fitted was used almost daily for twelve months, and the tire given to the Scottish Museum had never been punctured.

### De Lisser Banquetted by Former Staff.

Horace De Lisser, vice-president and general sales manager of the United States Motor Co., the selling organization for the Maxwell and Columbia interests, was the guest of honor on Saturday night last at a dinner tendered him by branch managers, salesmen and officials of the Ajax-Grieb Rubber Co., at Delmonico's, in New York. Sharing the honors with Mr. De Lisser was William G. Grieb, who has succeeded the former as president of the Ajax concern. Former President De Lisser always was popular with the rank and file of the Ajax organization, and the banquet was in the nature of tangible proof.

## HANSHUE FASTEST ON 'FRISCO HILL

**Takes the Honors in Free-for-All Event in Record Time—Other Awards are Well Distributed.**

Breaking the previous record for the course by  $5\frac{1}{2}$  seconds. Harris Hanshue, driving an Apperson Jackrabbit, won the free-for-all class at the second annual hill climb of the San Francisco Motor Club, held on the Nineteenth avenue boulevard course, Wednesday, March 30th. Hanshue's time for the distance of 1 1-20 miles was 1:07, the best previous time for the course having been established last year by a White steam car, which was not represented in this year's climb.

Although Hanshue won the free-for-all automobile race in record-breaking time his was not the fastest time of the afternoon. As usually is the case when automobiles and motorcycles mix, a motorcycle scored the speed honors of the occasion, W. G. Collins, on an Indian, soaring to the summit in  $57\frac{1}{2}$  seconds, by far the fastest time ever made over the course. This event brought the only mishap of the day. Herman Kohl, riding a Peugeot, was thrown while crossing the tracks, but escaped unhurt.

The day was ideal for the climb as the course was in good condition, while sunny skies made the atmosphere just right for comfort. The officials worked with clock-like precision so that there were no annoying delays, and as a result the crowd of 2,000 spectators, a majority of whom came in automobiles, went home well satisfied with the afternoon's sport.

The ball was started rolling at 2.30 o'clock, when Starter Edward Martin dispatched Frank Murray, in the little Buick. Murray could not seem to get any speed out of his car and required 1 minute  $32\frac{3}{4}$  seconds to reach the top. Ruddle in a Ford, followed in 1:18, but Cousins, in a Mitchell—the last one to start, beat the former's time by 3 seconds and took first prize for cars between \$850 and \$1,250.

The class for cars between \$1,251 and \$2,000 was well filled, six drivers taking the starter's count. In this event Murray drove a larger car and got to the summit in 1:12 $\frac{3}{4}$ , within  $\frac{1}{4}$  of a second of the record in last year's climb. C. O. King ran a very close second to Murray, the watches giving him 1:13 $\frac{3}{4}$ . The remaining cars took much longer to cover the distance. Because of the withdrawal of the Dorris car there were only two contestants in the class for cars between \$2,000 and \$3,000, but it resulted in the closest race of the day—both performances being a credit to the drivers and their cars. McDonald, in a Winton, was the first to make the ascent and the watches gave him 1:14 $\frac{3}{4}$ . Loughhead, in a Corbin, followed and managed to win the event by a margin of two-fifths of a second, his time

being 1:14 $\frac{3}{4}$ . The Palmer-Singer car was scratched in the event for cars between \$3,000 and \$4,000, allowing the Reliance Auto Co.'s Knox a walkover in 1:39 $\frac{3}{4}$ .

The spectators got their first glimpse of the big cars in action in the event for any cars costing \$4,000 or more. Charles Allen, in a Thomas, was the first man up in 1:11 $\frac{3}{4}$ , and when Charles Soules made his getaway in a Stearns a few moments later, the crowd expected to see the record wiped from the slate. Soules, however, disappointed his admirers, for his performance was one-fifth of a second slower than Allen's. The winner turned up in Hanshue, driving his Apperson, for his was the fastest time so far, the watches registering 1:07 $\frac{1}{4}$ . W. H. Hanson, in a Stearns, was another starter; his time was 1:21.

As in all hill climbing contests the greatest interest centered around the free-for-all event, as Hanshue had let it be known that he expected to better his time in the other event. Hanshue made good, as he sliced four-fifths of a second from his previous endeavor thereby breaking the automobile record for the course. The free-for-all attracted the greatest number of entries, 14 cars being represented. Second honors were divided between Earl Cooper, in a Pennsylvania, and O. C. Joslen, in a Stanley steamer, each reaching the summit in 1:09 $\frac{3}{4}$  seconds. Allen, in a Thomas, was third in 1:10 $\frac{3}{4}$ , and Soules, in a Stearns, was caught in 1:12 $\frac{3}{4}$ . The summaries:

#### Cars Costing \$850 to \$1,250.

- 1 H. R. Cousins, Mitchell ..... 1:15
- 2 A. Ruddle, Ford ..... 1:18
- 3 Frank Murray, Buick ..... 1:32 $\frac{3}{4}$

#### Cars Costing \$1,251 to \$2,000.

- 1 Frank Murray, Buick ..... 1:12 $\frac{3}{4}$
- 2 C. O. King, Maxwell ..... 1:13 $\frac{3}{4}$
- 3 Walter Morris, Autocar ..... 1:18
- 4 J. Lardher, Buick ..... 1:25
- 5 D. Longwell, Auburn ..... 1:28 $\frac{3}{4}$
- 6 W. R. Shadburne, Crawford ..... 1:52 $\frac{3}{4}$

#### Cars Costing \$2,001 to \$3,000.

- 1 A. Loughhead, Corbin ..... 1:14 $\frac{3}{4}$
- 2 A. McDonald, Winton ..... 1:14 $\frac{3}{4}$

#### Cars Costing \$3,001 to \$4,000.

- 1 Reliance Auto Co., Knox ..... 1:39 $\frac{3}{4}$

#### Cars Costing Above \$4,000.

- 1 Harris Hanshue, Apperson ..... 1:07 $\frac{1}{4}$
- 2 Charles Allen, Thomas ..... 1:11 $\frac{3}{4}$
- 3 Charles Soules, Stearns ..... 1:11 $\frac{3}{4}$
- 4 W. H. Hanson, Stearns ..... 1:21

#### Free-for-All.

- 1 Harris Hanshue, Apperson ..... 1:07
- 2 Earl Cooper, Pennsylvania ..... 1:09 $\frac{3}{4}$
- O. C. Joslen, Stanley ..... 1:09 $\frac{3}{4}$
- 3 Charles Allen, Thomas ..... 1:10 $\frac{3}{4}$
- 4 Charles Soules, Stearns ..... 1:12 $\frac{3}{4}$
- 5 A. Loughhead, Corbin ..... 1:14 $\frac{3}{4}$
- 6 C. O. King, Maxwell ..... 1:15
- 7 H. R. Cousins, Mitchell ..... 1:17
- 8 Walter C. Morris, Autocar ..... 1:18 $\frac{3}{4}$
- W. H. Hanson, Stearns ..... 1:18 $\frac{3}{4}$
- 9 A. Ruddle, Ford ..... 1:19 $\frac{3}{4}$
- 10 Frank Murray, Buick ..... 1:20 $\frac{3}{4}$
- 11 D. Longwell, Auburn ..... 1:27 $\frac{3}{4}$
- 12 W. R. Shadburne, Crawford ..... 1:40 $\frac{3}{4}$

#### Motorcycles.

- 1 W. G. Collins, Indian ..... 0:57 $\frac{1}{2}$
- 2 Charles Balke, Thor ..... 1:12 $\frac{3}{4}$

**LEWIS TO BLAZE GLIDDEN ROUTE**

**Pathfinder Leaves Cincinnati on Monday  
to Mark the Way—Chicago to Offer  
Trophy for Contest.**

The Glidden Tour ball will be started rolling on Monday next, 11th inst., when the Chalmers pathfinding car, in charge of Dai H. Lewis, of the Buffalo Automobile Club, who acted as pathfinder last year, will begin the work of blazing the trail for this year's Glidden tour and contest for roadsters. Because of a financial misunderstanding it had been rumored that Lewis would not have charge of the preliminary arrangements this year, but this week it was learned that Lewis had arrived at an understanding and would be in charge of the Morgan & Wright shod Chalmers car when it leaves Cincinnati on Monday next. Joseph Gardham will be at the wheel, and Nathan Lazarnick will go along as official photographer.

The first day's run from Cincinnati will be through Lexington, Ky., to Louisville, a distance of 88 miles. The second day the trail blazer will make Nashville, Tenn., 205 miles; the third, Florence, Ala., 128 miles; the fourth, Memphis, Tenn., 165 miles; the fifth, Little Rock, Ark., 209 miles; the sixth, Texarkana, by way of Hot Springs, 172 miles; the seventh, Dallas, Tex., through Paris, 230 miles; the eighth, Oklahoma City, 204 miles; the ninth, through Wichita, Kan., to St. Joseph, Mo., 207 miles; the tenth, to Des Moines or Colfax, 195 miles; the eleventh, to Davenport, Ia., via Cedar Rapids, 200 miles, and the twelfth, from Davenport to Chicago, 200 miles.

This will make the tour approximately 2,500 miles in length and fully as long as last year's test, which started from Detroit and took in Chicago, Milwaukee, Minneapolis and Denver, and finished at Kansas City. The Sunday stops will be at Memphis and St. Joseph.

There still is some doubt as to whether the tourists will be asked to make the leg from Dallas to Oklahoma City in one or two days. That is a stretch of 204 miles and the going isn't any too good. Therefore, it has been left to the discretion of the pathfinders.

The only change from the route first announced by the A. A. A. is that the tour will go from Nashville to Memphis by way of Florence instead of going over the mountains. It is definitely settled that the tour shall start from Cincinnati and end in Chicago.

Not the least important announcement this week in connection with the arrangements for the Glidden tour was the statement that the Chicago Motor Club has offered to donate the trophy to be competed for by the roadsters, and that it will be known as the "Chicago Trophy." This gift

is a departure from the precedent as the previous awards have consisted of shields presented by the chairmen of the contest board, one having been given by Paul Deming and three by Frank B. Hower. The details of the trophy have been left to a committee of the Chicago Motor Club consisting of Harry T. Clinton, Henry Paulman and John Maus. As the conditions this year will permit not only two and three, but four passengers as well, to compete in the roadster division, there are those who will not be surprised were the entries in this division more numerous than in the Glidden tour class proper, which essentially is for touring cars.

**Hurled Wrench Kills a Motorist.**

Throwing things at motorists has always been a rather favorite pastime of the ubiquitous small boy, but when full grown men take to throwing iron wrenches at passing automobiles, just because the latter happen to frighten a balky pair of mules, what may otherwise be regarded as a nuisance becomes a crime of the most serious sort. Sylvanus Johnson, a wealthy citizen of Roswell, N. M., is dead from the effects of a blow from a wrench hurled at Johnson's head a few days ago by an unknown farmer. While speeding along the road near Roswell, Johnson's automobile frightened a team of mules driven by a young farmer, and the latter threw his wrench at the chauffeur. The wrench struck Johnson, who sank back in his seat unconscious and with a crushed skull. The farmer escaped, and no clue to his identity so far has been found.

**Rochester Reelects All Officials.**

Before sitting down to their annual banquet at the Hotel Seneca last week, members of the Automobile Club of Rochester, N. Y., held their annual election and unanimously re-elected all of the present incumbents for another term as follows: Henry G. Strong, president; William C. Barry, Jr., first vice-president; W. W. Hibbard, second vice-president; Bert Van Tuyle, secretary; W. W. Dake, treasurer. Directors, three years, William C. Likly, C. J. Brown, Robert C. Shumway, N. R. Potter; two years, R. M. Searle, C. F. Wray, S. H. Mora, George Dietrich; one year, J. E. Morey, Rudolph Schmidt, J. E. Gleason, G. C. Gordon.

**Here's a Genuine E-M-F. Infant.**

Children have been named after almost everything under the sun, from presidents and kings down to prize fighters and baseball players, but the distinction of being the first man to have his boy christened after an automobile belongs to Howard Carpenter, of Ellisville, Ill. The latter some time ago bought an E-M-F. "30," and became so enthusiastic over it that when a little Carpenter arrived in the home of the "Newly-weds," they christened him E-M-F. Carpenter.

**DATE FIXED FOR VANDERBILT RACE**

**Will be Run Earlier Than Ever and Awards  
Will be Larger—Minor Events  
Also Carded.**

Scheduled earlier than ever before in its history, and under improved conditions which should make the finishes in all classes closer together and more exciting than heretofore, that premier American classic, the Vanderbilt Cup race, will be run for the sixth time, on Saturday, October 1, over the Long Island Motor Parkway and the adjacent highways of Nassau county, under the auspices of the Motor Cups Holding Co., of Mineola, L. I. Starting at 9 a. m. the race will be run over the same course and distance as last year, comprising the Parkway, Massapequa and Old Country roads, a 12.64 miles circuit which will be covered 22 times, making a total of 278.08 miles for the big race.

This year the emoluments which will go to the winner will be more valuable than ever before, and doubtless will serve to attract noted drivers who refrained from competing last year because of the, in their opinion, inadequate compensation offered. The victor, in addition to the honor of having his name inscribed on the trophy will receive \$2,000 in cash and a bronze plaque which will be his permanent property. The contest will be open to all cars owned in this country, whether of domestic or foreign manufacture, which have a piston displacement between 301-600 cubic inches, and of which make at least 50 cars of various models have been built during the year preceding the race. No other restrictions are imposed on cars which may be entered. While, under the 1910 contest rules of the American Automobile Association, which will govern the event, the piston displacement classification for the race, includes two classes in the A. A. A. category, the cars which may be in either division in the latter classification will compete as one class for the Vanderbilt Cup. However, there will be two plaques awarded, one to the driver making the fastest time in each class, while the pilot scoring the best time in either class also takes the cash and cup.

Retaining the features which lend to the function a merry-go-round resemblance, there also will be run at the same time and over the same course, as the big race, the two minor events, the Massapequa and Wheatley Hills Sweepstakes. These events will start at 10 o'clock, one hour after the Vanderbilt pilots are sent away, it being planned to have the drivers in these classes finish at or about the same time as the contestants in the major race. In the Massapequa race, which is open to cars having a piston displacement between 161 and 230 cubic inches, the circuit will be covered ten times, making a total mileage of 126.40, and

## THE MOTOR WORLD

### GRAND PRIZE RACE IS REVIVED

**Will Follow Vanderbilt Cup Event on Long Island Parkway—Gold Cup and \$4,000 Chief Award.**

Entry blanks for the second international road race for the Grand Prize of the Automobile Club of America, which will be held on the Long Island Motor Parkway, Saturday, October 15th, made their appearance this week, and if sufficient entries can be secured between now and August 1st, the time of closing, the race should assume the importance of the former international Vanderbilt cup races, and prove fully as interesting as the first Grand Prize race two years ago.

According to the announcement made this week the Motor Cups Holding Co., of which W. K. Vanderbilt, Jr., is president, will conduct the race, sanction having been granted by the Automobile Club of America.

The distance will be 278.08 miles, covering the course of 12.64 miles 22 times. As the International Association of Recognized Automobile Club has no formula for international racing this year, no restrictions as to weight, cylinders, dimensions, etc., will be made, but all cars taking part in the race must carry two persons seated side by side, of a minimum average weight of 134 pounds, and the cars must have a reverse gear driven by the motor, an exhaust that is not directed toward the ground, and the overall width of the car must not exceed 68.89 inches.

The entrance fee for each car is \$1,000 before August 1st., with an additional premium of \$250 for each car entered between August 1st and September 1st, the final date of closing. A deposit of \$300 per car must accompany the entries, which are to be made through the recognized automobile club in the country in which the car is manufactured. American entries are to be made through the Automobile Club of America. Should one manufacturer desire to enter two cars of the same make the fee will be \$1,500, and \$1,750 for three cars.

The first prize will be the gold cup which was first raced for in 1908, and which is said to have cost the Automobile Club of America \$5,000. In addition to the gold cup, cash prizes will be provided for the drivers, the first prize being \$4,000, the second prize, \$2,000 and the third prize \$1,000.

The first Grand Prize race was held at Savannah, Ga., November 26th, 1908, and as now is a matter of ancient history, was promoted by the Automobile Club of America, when it seceded from the American Automobile Association, primarily to "kill" the Vanderbilt Cup race that year. Four countries were represented—Italy, Germany, France and America—and the race was won by Wagner of Italy in a Fiat, who covered

the 402 miles at an average speed of 65.1 miles per hour. Hemery, of Germany, in a Benz, was second, the difference in time between them being only 56½ seconds. Since that time, the hatchet has been buried and the forthcoming race will be a harmonious one all around.

### Heaping Blame on Motor Cars.

First they blamed motoring for the prevalence of nervosity, then came "speed-mania" as a new disease, still later followed "nasomotor-rhinitis," and now comes the president of the American Boot and Shoe Manufacturers Association, J. H. Hanna, and blames the automobiles for the high price of boots and shoes. He explains that, on the one hand, owing to the increased demand for leather in connection with the upholstery of motor cars, and on the other, owing to the spread of vegetarianism, there is a shrinkage in the number of cattle being killed, the number of hides available for the manufacture of boots and shoes is decreasing. Manufacturers of raincoats, rubber boots and rubber tubing also are calling down the vengeance of heaven upon the motor car, which swallows all the rubber in sight and leaves them only the scraps.

### Motor Car "Unhors" a Trolley.

Hitherto, in collisions with trolley cars, the automobile usually came off second best, but at last it seems as if the big touring car has become tired of playing second fiddle and is going to do a little bumping on its own account. In Louisville, Ky., a six cylinder automobile so unceremoniously bumped into a trolley car, that it knocked the latter clear off the tracks, and pitched the motorman out into the street. The motorman has sued the automobile owner, and considers \$5,000 to be the proper sum due him for his hurt feelings.

### Tire Inflation that Lasted 14,000 Miles.

The extensive use to which the physician can put a motor car is well exemplified by Dr. J. G. Sheldon, of Kansas City, who reports having driven a Franklin 22,000 miles since May, 1908, an average of more than 33 miles a day. Even more remarkable than his mileage is Dr. Sheldon's tire record. He declares that three of the four tires on the car were not inflated until they had traveled 14,000 miles, and that the only attention the engine has required has been the cleaning of the auxiliary exhaust ports.

### Motor Wagons to Replace 1,000 Horses.

In order to make room for the new motor driven express wagons, the Southern Transfer & Express Co., of Rockford, Ill., offers its 1,000 horses for sale. For the purpose of preventing a sudden slump in the price of equines, should such a quantity be thrown into the market all at once, the company has announced its intention of disposing of only fifty head each week, until the whole thousand are sold.

the winner will receive \$1,000 in cash, in addition to possession of the trophy until it again is contested. Cars equipped with engines between 231 and 300 cubic inches will be eligible for the Wheatley Hills race, and will be required to make 15 circuits of the course, 189.60 miles. The winner will receive the same award as in the Massapequa event. All cars entered for any event must pass examination by a technical committee of the A. A. A. contest board prior to October 1. Entrants in the Vanderbilt will be assessed \$500 per car, and in the Massapequa and Wheatley Hills classes \$250 for each nomination, and prospective or intending entrants of machines are prohibited from making such announcement or practicing on the course until the entry is duly made and the fee paid.

### Regal to Start on Another Circuit.

The Regal Motor Car Co., which last year caused its first 1910 Regal "30" to be driven from New York to San Francisco in 30 days, and afterwards sent the car on a 15,000 miles demonstrating tour of the country, will, on the 11th inst., start the same car, now dubbed the Regal Plugger, on another circuit of the country. This itinerary will include all the larger cities in the eastern and central section of the country. The first section of the run lies between Detroit and New York, via Toledo, Cleveland, Buffalo, Syracuse, Boston, etc. The second section will lie toward Kansas City. The third section has a course to Omaha and the last section will be a return to Detroit via Chicago. The Regal people declare the car is absolutely the same, as it was when it reached San Francisco last year.

### Where Black Skin Has Advantages.

Although Paris, France, has enough stirring events to keep it busy, and has also enough woman taxi-chauffeurs without getting excited over one more or less, the latest addition to the "taxi-chauffeuses" is creating a veritable furore in the French capital, where negroes are comparatively few and far between. She is a mulatto, and her appearance on the boulevards furnished a sensation to the habitués of the streets, who it is said, used her cabs in preference to all others. According to the tall tale wafted from Paris, the dusky driver is never without a fare, and the gendarmes are called upon frequently to decide which one of the waiting customers is entitled to a ride in her cab.

### Ross Heads the Superior Club.

At the annual meeting of the Superior (Wis.) Automobile Club, officers for the coming year were elected as follows: Wilbur Ross, president; Dr. George Saunders, vice-president; A. T. Roth, secretary; Dr. H. J. O'Brien, treasurer; board of directors, the president, vice-president, Samuel Anderson, Dr. J. A. Rene and W. S. Wingate.

## DYNAMOS USED FOR RAMBLER TESTS

**Convertibility Feature of Laboratory and Bench Equipments—Unique Arrangement for Final Tryout.**

While the electric method for accurate and efficient testing of motors and complete machines, utilizing the dynamo both as a driving and driven agent, is not new, it is doubtful if ever it was employed on

power. Needless to add, the trial is made to include the full speed range.

During this test the engine is closely watched and if trouble of any kind, such as knocking bearings, noisy gears or valves, becomes apparent, the difficulty is immediately remedied. No engine is permitted to leave this stand, if it does not run noiselessly and without vibration.

These seventeen stands are constantly busy, while in addition, there is one reserve stand for experimental purposes.

is shown on an indicator, and serves to detect leaks of power, due to a possible error in assembling or to difficulties in transmission or axle.

The unique arrangement of this testing stand particularly deserves attention. As will be clearly seen from the accompanying photographs, the seat of the operator, indicator and rheostat are carried on a separate bridge-like structure completely independent of the chassis. By shifting the lever on the rheostat the tester can vary

MOTOR TESTING IN NEW RAMBLER LABORATORY

TEST BLOCKS IN NEW RAMBLER FACTORY

such an extensive scale as is the case in the factory of Thomas B. Jeffery & Co., Kenosha, Wis.

Because it is more difficult to detect flaws in a complete engine and a completed chassis, than to discover weaknesses in separate parts, one entire building—covering floor space equivalent to one-half the floor space of the original Rambler factory—is devoted to motor and chassis testing alone.

Seventeen dynamos are arranged on seventeen concrete stands, each stand making a complete unit, with necessary cooling apparatus and means to carry off the exhaust gases.

When a motor is completed in the engine assembly department, it is picked up by a traveling crane and carried to the testing department. Here it is deposited upon one of these stands, for the purpose of being tested before being mounted in the chassis, both in regard to its horsepower efficiency and in order to detect its most insignificant faults. Connections with the dynamo being established, the latter turns the engine while the new parts are thoroughly limbered. Then the operation is reversed. The engine is started and drives the dynamo, registering on the indicators the amount of power given. This operation continues for many hours, until the engine is thoroughly worked in, and scientific tests show that it is delivering its rated horse-

power. After an engine has successfully undergone this test, it is assembled in a chassis, and then returned to another part of this department, for the rear-wheel test.

"ROAD-TRYOUT" ON ROLLERS

The front wheels are securely blocked, while the rear wheels rest upon rollers sunk below the floor. These rollers are connected with a dynamo by means of chains. The power thus delivered to the dynamo

the resistance of the dynamo, increasing or decreasing the load which the motor has to overcome, and thereby giving the effect of hill climbing or running on level roads. Watching the indicator every instant during these tests the operator can easily determine exactly the amount of work done by the motor under varying loads and under diverse conditions.

As is but natural under such careful management, the materials going into the make-up of the new Rambler cars are subjected to the most rigid and careful tests before being cast or forged into cylinders and frames, valves and pistons. The tests are both mechanical and chemical, and are carried out in the elaborately equipped laboratories of the Rambler factory, where the facilities are such as to permit thorough and accurate tests of all kinds.

### New Jersey Dealers Choose Officers.

At the annual meeting of the New Jersey Automobile Trade Association in Newark last week, the following officers were elected: George E. Blakesley, president; J. W. Mason, vice-president; R. A. Greene, treasurer, and G. H. Smith, secretary. George Paddock, the retiring president, and Inglis M. Uppercu, were chosen directors for two years, and W. H. Ellis, the retiring secretary, director for one year. All of the officials, save President Blakesley, who hails from Jersey City, reside in Newark.

## TRAVELED UNFREQUENTED ROADS

**The Hansons, Man and Wife, Cross the Continent by Unusual Route—Experiences that Befell Them.**

From Saratoga Springs, N. Y., to San Francisco on a pleasure jaunt, through the bottomless mud of Louisiana, plowing through the swamps which no other car had ever been able to cross; lost in the Arizona and New Mexico deserts, into old Mexico and up the coast, that's the remarkable trip just completed by Walter H. Hanson and his wife in his 30-60 horsepower Stearns touring car.

When Hanson started out many tried to dissuade him from attempting the journey, telling him that it would be impossible to cross Louisiana, but Hanson was confident that his big and powerful Stearns would pull him through successfully, and he was not to be turned from his plans. At New Orleans the same story was told him—that it would be impossible for him to cross the state in the direction of Texas, a route that had never been traversed by an automobile. The roads were hub-deep in mire, and the rain was falling in torrents. For many a hundred miles the big Stearns pushed its way through the mud, most of the time on the low gear. At times the car was forced to run through lakes of water, and the engine was covered to prevent the flooding of the mechanism. This swamp land, Hanson says, is the worst that he had ever tackled in an automobile, and after reaching El Paso the party remained for a week of rest.

In New Mexico roads that never before had been traversed by a motor car were taken by the Stearns. The big machine proved a curiosity to the Indians, and at every stop was surrounded by natives, who had never seen an automobile before.

At Phoenix, Hanson was warned not to attempt to cross the desert at this season of the year. But he had braved hardships in the rice land of Louisiana, had faced highwaymen, and had traveled more than 5,000 miles without serious mishap, and the desert had no terrors for him. On the first day out both Mr. and Mrs. Hanson were charmed with the desert. They fared well until reaching Ehrenburg, on the Colorado River. Here some delay was occasioned by the Indians who were not prepared to ferry the motorists over the river. Luckily for the Hansons the car was well stocked with provisions, for there is only enough at Ehrenburg for the few Indians who spend the winter there.

Then came along a big sand storm, and for a day and a night the party were lost on the desert somewhere between Ehrenburg and Chuchawalla. Roads, which are at best mere trails through the wilderness were completely obliterated during the

storm, and the motorists were appalled to find before them nothing but a wild waste of sand, with the wind blowing hard across the plain. The wind tore the flaps from the side of the machine and sand penetrated every part of the mechanism. Using the big car as a wind break, the party went into camp without knowing where they were. It was impossible to see further.

On the following morning the storm had abated sufficiently to allow the party to go on. The car, however, was driven far out of the regular track and it was not until dark that Mecca was reached, with less than half a gallon of gasoline in the tank.

These were only some of the experiences of the party on the long journey. At present the Hansons are touring in California before leaving for the East. Mrs. Hanson is a niece of Leland Stanford and she expects to spend some time visiting the famous university of the same name.

### Seeks National Aid for Road Work.

Although President Taft has declared that road improvement is essentially a function of the several states and thereby cast dampened hope of national aid, it has not deterred Senator Bankhead from introducing and having favorably reported to the Senate a bill which seeks to make the Federal government a party to such far-reaching work.

The measure provides an appropriation of \$500,000 for the beginning of the highway construction. It is said in the report that this amount is purely for an experimental trial of the plan.

The Bankhead bill stipulates that the \$500,000 shall be spent in building better roads for the rural free mail delivery service. This feature of the bill makes it an act to extend a governmental function. The requirement is incorporated, however, that for every dollar the government spends in road building, the state or county where it is expended must spend another dollar on the same road. This means \$1,000,000 worth of good roads out of the first appropriation.

It is declared in the report that there is a country-wide sentiment in favor of better public highways. The automobile has done much to encourage this sentiment. Various states have made appropriations, and these have been supplemented by the counties, the report further states.

It is set forth that there is now an annual appropriation of \$35,673,000 for the rural free delivery service. This service is seriously hampered by the bad roads. To build better roads on the rural routes would therefore serve a double purpose, the report says. It would facilitate the mail service, and give the country people better highway accommodations.

Senator Bankhead also refers to the fact that France has expended \$612,775,000 on its system of highways. It is therefore possible in that country for a single horse to haul on an average 3,306 pounds at a load.

## NOMENCLATURE OF TIRES AND RIMS

**Definitions that Will Assist Understanding of Common but Confusing Terms—"Q. D.'s" and Demountables.**

While the average motorist usually is familiar with the nomenclature of the rims and other parts of the chassis, he sometimes is in a quandary when it comes to the correct terms to use when ordering his tires. To assist understanding in this regard, the Firestone Tire & Rubber Co. has issued an explanation which shows clearly the difference between the various kinds of tires and rims manufactured and marketed at present.

The regular clincher tire has a pliable base or "bead" and fits the one-piece clincher rim. All tires larger than 3-inch require staybolts (otherwise known as lugs) to anchor the tire safely in the rim.

The Quick Detachable clincher tire has a stiff base and is fitted with flap to protect inner tube and prevent tire from creeping. This tire is used on quick detachable rims having removable clincher sile-locking rings. No staybolts are required.

The Quick Detachable Cable Base tire, variously known as the straight-side or straight-bead, has wire cables embedded in its base, making the bead rigid and non-elastic. This tire fits quick detachable rims using side-locking rings, whose inner edges are either straight or curved outwardly, instead of being clincher shape. No staybolts are required.

The clincher demountable rim carries one-piece clincher rims and regular clincher tires. It requires a series of special short-stem staybolts.

The quick detachable demountable rim carries quick detachable clincher rims and tires. It combines the already inflated tire feature with the facilities for quick replacement of tires on the loose rims afforded by the quick detachable rim. No staybolts are used.

### How Mirror Would Help Wagons.

Motorists who value the appearance of the rear panels of their expensive limousine cars have made it a fixed custom to equip each new car with a mirror which will afford the driver an indication of the nature and probable movements of following traffic. The principle of self-preservation has induced the practice, though it is in no wise compulsory. Some day, it may be, owners of commercial vehicles which carry bulky loads or obtrusive bodies may be induced to adopt the same practice. It would materially assist the drivers of such machines and also would tend to make their evolutions less of a menace. Indeed, the city of Los Angeles already has taken the unpleasant initiative of requiring the use of such devices on all covered vehicles.

## HOW NEWCOMB INJECTS THE FUEL

Simple Pump Replaces Carburetter and May be Adapted to Two-Cycle or Four-Cycle Engines.

Among the numerous and widely varying projects for the development of the internal combustion motor none has more uniform support from the theoretical point of view than that of fuel injection. Several different types of engine have been built which operated with more or less success on this plan, the latest and most interesting enter-

is to license other manufacturers to use the Newcomb patents, which, in a broad way, are held to cover the use of the fuel injection plan under certain conditions. Though the engine has not come before the public hitherto, one prominent New England automobile manufacturer has been developing it with a view to its adoption in commercial vehicle haulage and was known to be at work upon it even before the formal organization of the Newcomb Engine Co.

Generally, the Newcomb plan, as it may be termed, is merely that of eliminating the ordinary carburetter and substituting for it a fuel pump capable of feeding the liquid

Whereas in the ordinary two or four cycle motor, governing commonly is accomplished by throttling the charge without altering substantially the proportions of the gas, in the Newcomb engine, the quantity of fuel is the only variable encountered. This means that at slow speeds and light loads the gas is burned in an excess of air, and the result is that theoretically perfect combustion is secured. As a certain amount of waste gas always remains in the combustion chamber at the conclusion of the exhaust stroke, it follows that with the conventional form of engine, throttling besides reducing the quantity of gas inducted also has the effect of increasing the proportion

NEWCOMB ENGINE SHOWING FUEL PUMP

END VIEW SHOWING TEST EQUIPMENT

prise of the sort being the Newcomb engine. Although this motor is not absolutely new, its invention dating back several years, in fact, it was given its first extensive public demonstration recently when Joseph H. Freeman, a Wall street engineering expert, explained its principles and pointed out the mechanical features of a working model which was exhibited to the members of the Automobile Club of America at its Fifty-fourth street club house.

Following several years of experimentation on the part of its inventor, Edward C. Newcomb, the Newcomb Engine Co. was organized about one year ago, "to manufacture engines and automobiles." The chief purpose of the company, however, as the Motor World explained at the time,

fuel directly into the combustion chamber at the end of the compression stroke. As a result of this apparently slight change in the mechanical construction of the engine, the cycle is altered to the extent that instead of inducting a supposedly homogeneous mixture of gasoline vapor and air, only pure air is drawn into the cylinder during the suction stroke. This is compressed during the following stroke and is energized by the usual ignition or explosion process during the working stroke, in the regular way. The most evident advantage of the Newcomb system results from the fact that the fuel is injected into the charge of compressed air in variable amounts conditioned on the load requirement of the motor.

of combustible gas to non-combustible residue. With the arrangement contemplated in the Newcomb engine, however, the proportion of air to residue remains fixed, so that with small fuel charges there always is an abundance of air to support combustion.

Ensuring perfect combustion at low speeds and loads has the effect of increasing the mean effective pressure and so the power of the engine, and so of augmenting both its torque at low speeds and its thermal efficiency. At full loads, of course, complete impregnation of the air with fuel vapor, forming a thoroughly carburetted charge, is possible, but obvious advantages result from retaining a slight surplus of air even under full load conditions, since

theoretically it ensures perfect combustion. As a matter of fact it is claimed that about 90 per cent. of the maximum possible mean effective pressure is obtainable with about 75 per cent. of the fuel necessary to form the most explosive homogenous mixture with the entire charge.

The breadth of the Newcomb plan may be understood when it is explained that it is equally applicable to both two-cycle and four-cycle motors; in fact, its scope is so broad that it almost might be inferred that a license to use it would convey upon manufacturers the privilege of merely employing a fuel pump instead of a carburetter, but otherwise to follow their own inclinations in regard to design and construction. The real distinction between this and other fuel injection projects, however, lies in the fact that with the Newcomb engine, injection takes place after the completion of what is currently understood as a normal degree of compression. Like them, however, the exact instant of injection and the quantity of oil delivered may be varied to suit the load requirements.

This is an important distinction, because of the numerous other fuel injection systems which have been invented, by far most conspicuous is the Diesel, wherein an abnormal degree of compression is essential. In this system, pure air is compressed to such a degree that its temperature rises above that required to ignite the mixture. Injection takes place during the working stroke, the fuel being ignited instantaneously as it is forced into the cylinder. Because of the extremely high rate of thermal efficiency achieved with this motor it has come to be considered as more or less a classical example of its type, although it has not been reduced to small sizes and is not generally considered directly applicable to use in motor cars at the present time.

In still another fuel injection system, which only recently has been patented in this country, high compression also is employed, the scheme being to compress pure air to a point above the temperature at which the fuel will vaporize, and to inject the fuel when that point is reached, but before compression is complete, subsequently carrying out the functions of ignition and expansion in the normal way.

Although the Newcomb principle already has been applied in a variety of ways, preference is expressed for the two-cycle type of engine because, as Mr. Freeman explains, "it may be made to develop about as high a mean effective pressure in the two-cycle as is possible in the four-cycle, and at the same time operate as efficiently through as wide a range of speed." The first engine built was of this type, and it is this motor which is here illustrated as mounted for testing purposes in the laboratories of Columbia University. Its cylinder dimensions are  $5\frac{1}{2}$  by  $5\frac{1}{2}$  inches, bore and stroke, with  $4\frac{3}{4}$  inches effective length of stroke. In construction it is not unlike

other two-cycle motors of conventional pattern save for the fuel pump, which is plainly shown in one of the pictures, from the top of which a very fine tube is seen to lead to the cylinder head.

With this motor it has been found possible to run under various loads with mixtures ranging from  $15\frac{1}{2}$  to 1 gasoline and air—which is about the best for a homogenous mixture—down to a minimum of 76 to 1. The high consumption was obtained under conditions of maximum speed and load.

With an improved form of pump which since has been developed, it is claimed that an even smaller content of fuel can be used in the cylinder. Under laboratory test at Columbia the small engine developed a maximum brake efficiency of about 26 per cent.; at half load, its efficiency was on a par with that of many automobile motors of the standard type in current use, amounting to full 21 per cent., while at one-quarter its full load, the brake efficiency developed reached the extraordinary ratio of 16 per cent.

A Diesel motor having twice the power and more than five times the degree of compression has developed a maximum brake efficiency at full load of from 25.6 to 28.6 per cent. A four-cylinder English automobile motor of conventional pattern, but of slightly less displacement per cylinder, is credited with a maximum performance of 20.7 per cent. efficiency while developing 41.5 horsepower; while the best performance of one standard American automobile manufacturer's product was 20.8 per cent., while developing its maximum power under test conditions, both these results being from recent and authentic independent sources. The working conditions under which the average engine labors in automobile service render the results commercially obtainable, admittedly even less efficient than this.

A series of 18 tests from about 4 to 14 brake horsepower, gave a mean consumption of 0.7 pound of fuel per brake horsepower hour for the average figure. The best performance was 0.545 pound per brake horsepower hour. The mean consumption per indicated horsepower hour was 0.48 pound of fuel, and the maximum consumption was 0.33 pound per indicated horsepower hour. The mechanical efficiency of the motor averaged 66 per cent., and the maximum was 84 per cent.

Tests with motor vehicles equipped with Newcomb engines have shown encouraging results also. A 4,500 pounds car, driven by a  $5\frac{1}{2}$  by  $5\frac{1}{2}$  inch four-cylinder motor, developed 15 miles on a gallon of gasoline. A commercial vehicle equipped with solid tires and weighing with load about 3,500 pounds, gave 25 miles per gallon over ordinary roads.

The advantages of the engine are thus summarized by its sponsors:

"(a) It shows high efficiency under light as well as under heavy loads. The normal

load may be below the maximum, thereby enabling the engine to take a heavy overload like a steam engine.

"(b) High mean effective pressures and frequent impulses give great power and uniform torque in proportion to speed and weight.

"(c) It will develop its maximum turning effort or torque at much lower speeds than existing types of automobile engines. This renders unnecessary the frequent use of much gears. An automobile equipped with this engine can climb a steep grade at low speed as well as at high speed. The automobile equipped with the four-cylinder engine geared 1.6 to 1 on high speed, and yet the automobile can be driven at high speed as low as nine or ten miles an hour. The engine operates more like a steam engine than the ordinary carburetter engine, whether of the two-cycle or the four-cycle type.

"(d) The engine will accelerate rapidly. Full load can be applied instantly when the engine is running at low speed.

"(e) Low heat losses to cylinder walls and at the exhaust. The four-cylinder 60 horsepower engine is sufficiently cooled with a radiator of the size usually employed with a 40 horsepower engine. The engine is well adapted for air cooling. The exhaust temperatures are so low as not to burn out ordinary paint on the exhaust pipe.

"(f) There is no carburetter, and consequently carburetter troubles are removed—a particularly important advantage in two-cycle engines."

#### To Sound Horn with the Elbow.

A rather ingenious device for permitting the driver to sound his horn without removing his hands from the steering wheel has been developed in the form of a spun brass holder of concave form and exactly the same shape as one-half the regular rubber bulb. This is combined with the usual attachment for the bulb and tube and mounted in such a way that the driver's elbow naturally comes to rest on the arm of the seat just inside the bulb. From that position it is a simple matter to press down upon the bulb much as a Scottish musician works the "pipes."

#### To Geep Grit from Cylinders.

Priming cups, which are used for the double purpose of relieving compression in the cylinders and injecting gasoline or kerosene, always should be wiped out before being used. Unless they are protected by covers, as some of them are, they are certain to pick up and retain a not inconsiderable amount of grit from the dust which constantly is being drawn through the bonnet space by the fan. There is apt to be just enough grit in such an accumulation to mar the surface of the cylinder seriously unless care is taken to prevent it from finding its way into the combustion chamber.

### FOR FARM WORK OR CITY USE

**Avery Tractor a Remarkable Example of Vehicular "Versatility"—Almost Countless Uses to Which It May be Put.**

Although the automobile in its application to farm and industrial work still is in its infancy, remarkable efficiency appears to have been attained already, and indications point to a still greater usage. The

the tractor has been designed to run.

It is in its great adaptability to various purposes that the Avery tractor is most remarkable. With very little trouble a series of widely differing bodies can be attached to the regular chassis, making it useful as a truck, a cattle carrier, grain transporter and log hauler. In addition to freighting, the tractor will pull loaded wagons, road graders, plows, manure spreaders, reapers, binders, seeders and other agricultural machinery, and when not engaged

6-inch steel tires, with 2-inch hardwood plugs, 140-inch wheel base, three tons carrying capacity, a weight of 5,400 pounds, and a gasolene tank capacity of 24 gallons.

#### Pittsburg Has a "Prize" Car.

Pittsburg, which grows millionaires as well as grafters, has an automobile which it believes is entitled to more than passing notice. It belongs to the city government and in the short space of seven months the cost for repairs, gasolene, etc., amounted

AVERY TRACTOR IN USE AS STAKE TRUCK

SHOWING ODD SEATING ARRANGEMENT

Avery tractor, one of the vehicles designed for such employment, presents some very unique ideas in construction, and stands as a good example of general adaptability.

The most conspicuous departure from the conventional is in the construction of the wheels. The regular equipment consists of cast steel rims, perforated and filled with 2-inch plugs, suited to the purposes of a farm tractor and yet noiseless enough to meet every requirement regarding hauling on paved city streets. As shown in the accompanying illustration, the rear wheels may be fitted with an auxiliary attachment, consisting of an extension bolted to the outside of the rim and containing a series of blades set at angles, which automatically go into action the moment the wheel strikes soft ground and begins to slip back. The blades then catch and throw back, penetrating the earth to a depth of  $\frac{3}{4}$  inches. In the field or on soft land, they may be thrown out and locked with pin in permanent working position; passing onto hard roads, or for continued hauling to and from the city, they may be detached entirely by removing a few bolts.

Another rather unique arrangement in the Avery tractor, which is made by the Avery Co., Peoria, Ill., is the placing of the two seats to the right and left of the engine, instead of behind. In the very center below the radiator will be seen a pulley for all kinds of belt driven machinery, which

in either hauling or pulling will patiently turn mills, saws, threshers, feed grinders, corn shellers, ensilage cutters and similar machinery in field or on the farm.

When used in its slightly altered form in the city, it will, in addition to hauling freight of all kinds and pulling trailers and street sweepers, rollers, graders, sprinklers

MUD PADDLES ON REAR WHEEL

and garbage wagons, drive concrete mixers, contractors' hoists and similar rotating machinery.

Mechanically, the tractor is of four cylinders, twelve normal horsepower,  $4\frac{3}{4} \times 5$  bore and stroke, water cooled, with dual ignition, internal expanding brakes,  $41\frac{1}{2}$ -inch wheels,

to \$1,166.54, or about \$5.60 per day. Automobile owners who saw the bill, suggested that the car must have passed through some exciting adventures in the shape of collisions and smashups, otherwise it is difficult to understand items such as these: two rear hubs \$28, two axle sleeves \$47.60, two rear hub caps \$7.40, two brace rods to strengthen frame \$25, axle housings \$35, repairing rear mud guards \$26, front mud guards \$11.25, repairing radiator \$21.50, and three gears \$2. In one month 220 gallons of gasolene were charged, while on some days as much as 16 gallons are claimed to have been used.

#### Ambulance the Deadliest of Vehicles.

The generally accepted opinion that motor cars are responsible for most of the traffic accidents, receives a rather severe jolt from Judge Warren W. Foster of General Sessions, New York City. The judge, after reading the report of the board of coroners of the borough of Manhattan, said that automobiles were much safer than other vehicles, for despite the great number of automobiles used in this city only 43 people were killed by them during the year 1909, while horse driven wagons were responsible for 79 deaths during the same time. Of all the vehicles in the great city, the ambulance, whose mission is to save lives, is the most deadly of all, while the police patrol is second as an executioner.

## SPEAKS PLAINLY ABOUT PATENTS

Head of Patent Office Declares 60 Per Cent. are Worthless—Criticizes American System.

Because of their vital relationship with the motor car industry and their importance to the manufacturers of both cars and accessories, the matter of United States patents is one of more than academic interest to the trade as a whole, and the startling criticisms which Commissioner of Patents Moore has to offer on the American patent system, as indicated by his statements before the House Committee on Patents, are of a kind that may prove something of a shock not only to inventors and mechanical men but also to those who deal with patents only on the business side. He not only supports the contention that has been made to the effect that a patent is merely "a license to sue," but also indicates that the Patent Office constantly is subject to pressure and attempted tampering by big interests.

"We are handing out to-day, in 60 per cent. of the cases, patents that are almost worthless, in whole or in part," the Commissioner declared at the committee hearing. "Germany has a vastly superior system to ours. So has Great Britain. I have been over there three times to investigate conditions in Europe. German patents are better, because their applications are more thoroughly searched before patents are granted, owing, of course, to the better facilities afforded by the German Patent Office. The government makes guaranty of the patent, throwing the burden of proof on the infringer.

"In this country the Board of Examiners in Chief is a judicial body and passes upon a great quantity of cases where large monetary interests are at work. I could cite you many cases where influences are brought to bear. I have been approached. There is hardly a day passes that some sort of influence is not brought to bear upon some one in our office, and I suppose every Commissioner has felt the same thing."

### Strainer that Must be Kept Clean.

With the method of engine lubrication by means of constant flow through the crank shaft and drainage to a well in the lower part of the engine base, eminently satisfactory results are obtainable, so long as two simple conditions are fulfilled. It is necessary to use a proper grade of oil, such as is recommended by the manufacturer, in order to ensure the feeding of a proper quantity by the pump. It also is necessary to keep the filter, through which the oil must pass before being recirculated, absolutely free from obstructing particles of metal, carbonized oil or waste. In particular, attention should be paid to the

strainer within a short time after the engine has been overhauled for any reason, as there is every likelihood in the world that careless mechanics may have left a few shreds of cotton thread in the case.

### Magneto with Automatic Timing.

In order to solve the problem of automatic ignition timing, Ernst Eisemann & Co., Ltd., as early as 1905, secured control of certain foreign patents which, though not pertaining to the automatic part of ignition timing, obstructed the path from the standpoint of design. An early Eisemann magneto had a longitudinal spark timing motion in which the separation of the armature from the pole pieces could be varied at the will of the operator to 60 degrees, so that the spark was of uniform strength in every position, even for maximum retard. A new

design, based upon this original construction, is now disclosed by the Eisemann Magneto Co. in a magneto with automatic timing device.

In the former magneto it was necessary to change the relative position of the armature to the pole pieces, by means of a lever at the driver's seat. This required connections from the magneto to the lever on the steering wheel. The advance or retard of the spark is adjusted in the new Eisemann magneto, shown in the illustration, by a small centrifugal governor which is secured to the driving shaft of the magneto. The armature of the magneto, which is connected to the governor, is shifted to an advanced position whenever the speed of the motor increases, and as soon as the fuel supply is reduced it automatically returns to the retard position. The advance or retard of the spark is always exactly proportional to the speed of the motor, consequently ignition always occurs at the most propitious time.

### Adapting Lamps to Electricity.

In adapting gas and oil lamps to the use of electricity, care should be taken to see that the wiring is so arranged as to prevent any possibility of chafing. Particularly if the lights are supplied with current from the ignition battery, there is danger that a ground or short-circuit produced in this way may result in running down the battery without apparent cause.

## TO DISPLAY DETROIT PRODUCTS

Will Constitute "Automobile Group" in that City's Industrial Exposition—The Manufacturers Assigned Space.

One section of the Industrial Exposition, to be held in Detroit June 20th to July 6th, will be devoted to the automobiles and accessories manufactured in that city. This group of exhibits will compare in size with many of the local automobile shows, as the city's motor car manufacturers wish to impress upon the world Detroit's eminence in the industry. The ground floor of the Wayne Pavilion has been set aside as the transportation department of the exposition and by a unique arrangement, the aisles of the temporary adjoining buildings will extend through the automobile group and thus assist in leading visitors to the latter display.

The automobile manufacturers to whom spaces have been assigned are: Anderson Carriage Co., Briscoe Mfg. Co., Cadillac Motor Car Co., Chalmers Motor Co., E-M-F. Co., Ford Motor Co., Grabowsky Power Wagon Co., Frank D. Hovey, Hudson Motor Car Co., Hupp Motor Car Co., Packard Motor Car Co., Stuart Commercial Car Co., Warren Motor Car Co., and Welch Company of Detroit. The manufacturers of automobile accessories are: Anderson Forge & Machine Co., Belknap & Schwartz, Briscoe Mfg. Co., Detroit Lubricator Co., Detroit Motor Casting Co., Detroit Steering Wheel & Wind Shield Co., Edmund & Jones Mfg. Co., Hayes Mfg. Co., Hoskins Mfg. Co., McCord Mfg. Co., Roberts Brass Mfg. Co., Russell Motor Axle Co., Timken-Detroit Axle Co., and C. R. Wilson Body Co.

### Cramping the Gear Shifting Lever.

Cramping of the gear shifting lever occasionally may result if the bolts which attach the segment to the frame become loosened. Particularly if the control be of the sort in which the rocker shaft is made to slide transversely of the car in making the selections, it is important to have the system work freely and without undue resistance. To avoid difficulty of this order the segment fastenings should be inspected occasionally.

### Detroit Seeking Support in Tennessee.

A. A. House, of Detroit, who is described as having a two-cycle engine embodying novel features, is in Chattanooga, Tenn., seeking to interest capital. Ten residents of that city already have advanced \$250 each in order to enable Mr. House to give a practical demonstration of his motor and otherwise to make good his claims. If they are borne out by these tests, Chattanooga expects that another factory will be located "in its midst."

## VARIATION OF THE DOUBLE PISTON

Old Idea Applied in New Form and Combined with Sliding Valve—The Advantages Claimed.

It is a remarkable fact that the effect of the stir which the introduction of the slide valve engine into England has created has been manifest in numerous instances in designs which at first might seem to have

tons almost meet and once they approach and again separate, leaving a much greater clearance volume between their respective surfaces. The result is that at the end of the exhaust stroke the cylinder practically is emptied of all gas, while at the end of compression a normal amount of space remains for the imprisoned combustible. Furthermore, such is the arrangement that the cylinder volume utilized for the induction stroke is less than that into which the heated gases are permitted to expand. The

Above the main piston is an auxiliary piston B1, driving the crankshaft C1 through the connecting rod D1.

"In the design shown the two crankshafts are geared together through the medium of suitable skew gears E, and the vertical shaft F. The gears are so proportioned as to give the shaft C1, a speed rotation equal to half that of the main crankshaft C.

The auxiliary piston is extended downwards, the extension forming a sleeve B2 inside which the main piston works. In this sleeve, just below the auxiliary piston proper, the ports G and H (shown in dotted lines in the second illustration). These two ports are by the motion of the auxiliary piston brought opposite the ports N and O in the cylinder twice during every complete cycle, but they are only in communication therewith once during every cycle, for between the auxiliary piston and the walls of the cylinder is a sleeve K. This sleeve is given a reciprocating motion by the connecting rod C2 to the auxiliary crankshaft. It thus makes the same number of strokes as the auxiliary piston, but is timed differently.

In the sleeve K are suitably placed ports M-M1, which communicate from time to time with the inlet port N and exhaust ports O, respectively. Thus, for example, gases can only enter the cylinder when the port M is in communication with N and at the same time is registering with the port G in the auxiliary piston. These two requirements are only satisfied once in every cycle, namely, during the induction stroke of

SEARS DOUBLE PISTON ENGINE

END VIEW SHOWING PORTS

small relation to the sliding sleeve itself. Indeed, it would appear that the success of a single radical design has lent courage to many inventors to launch projects which long had been germinating. One of the most remarkable examples of the slide valve school, and one which embodies so much real originality that it seems almost a pity to include it among the followers of the Knight engine which furnished the real impetus to the slide valve movement, is the invention of J. E. Sears. In this motor the sliding sleeve feature plays rather an inconspicuous part, as a matter of fact, the most important departure from current practice being in the use of double pistons. In reviving the double piston idea and combining it with the sleeve valve principle, however, Mr. Sears has gone a step further than any of his predecessors, in producing a scavenging cycle not unlike that of the more or less classical Atkinson engine, of early and short lived attainments.

The basic idea is that of employing two pistons in each cylinder, but instead of causing them to move synchronously in opposite directions, to interconnect the crankshafts which they impel in such a way as to cause the upper piston to move at half the speed of the lower one. The result is that at a certain period in its movement the upper piston overlaps the travel of the lower one, while once during each cycle the pis-

LAYOUT OF SEARS PISTON AND VALVE MOTION

result is a closer approximation to the ideal which Atkinson sought than has since been achieved, together with a promise of practical working results which that engine never accomplished.

The mechanical method by which this extraordinary result has been accomplished is shown by the accompanying illustrations. The operation of the mechanism is thus described by the Autocar, to which is due the credit of having "discovered" the Sears engine:

"The main piston B works in the cylinder in the ordinary manner, being connected to the crankshaft C by the connecting rod D.

the main piston. Similar requirements are met and satisfied on the exhaust side."

Ignition is brought about through the agency of the usual jump spark system, the plug being placed in a cup-like depression or counter bore in the cylinder wall, "the plug being so placed," continues the above authority, "as to be in communication with the cylinder, owing to the ports M and G registering with one another when the main piston approaches the top of the compression stroke, at which time the port M is not, of course, in communication with N."

A clearer idea of the results obtained may be gained from the functional diagram, in

which the relative movements of the main and auxiliary pistons are indicated by the heavy lines, the layout representing one complete cycle of 720 degrees of crank shaft revolution. The vertical rulings are spaced 180 degrees apart and indicate the four respective strokes of the main piston and the two strokes of the auxiliary one, which are necessary to complete the cycle. It will be observed that the auxiliary member reaches the lower end of its travel just before the main piston is at the end of its first down stroke, and that the auxiliary is at the upward limit of its travel and just commencing to descend at the instant when the main piston is at the end of its second down stroke. Thus the cylinder volumes at the end of the induction and working strokes, respectively, are shown to differ in proportion to the difference in lengths of the 180 and 360 degree ordinates.

Similarly it is evident that while the two pistons almost meet at the end of exhaust, thus expelling practically all gases from the cylinder, at the end of the first 360 degrees of crank motion, they are separated for the reason that the auxiliary piston is moving upward and is at about mid-stroke. This leaves the requisite cylinder volume for the compression of the charge prior to ignition. As a matter of fact, in the engine here illustrated, the ratio of compression is something like 4:1, while the ratio of expansion is 6:1.

The method of distribution is no less plainly indicated on the diagram, though somewhat more difficult to follow. The wall ports in the cylinder being stationary with respect to the piston movements, are indicated on the diagram by horizontal lines, the intake port being measured by the space enclosed between the lines marked S, and the exhaust similarly at E. The ports in the apron or sleeve of the auxiliary piston naturally follow the movements of that organ, and hence are indicated by the lines S1 and E1, respectively, which, with the line of auxiliary piston movement measure the extent of their area. Obviously the intersection of the bands S-S1 and E-E1, respectively, in any case indicates the amount and duration of intake or exhaust port opening in any case. In the same way, the bands S2 and E2 indicate the relative area and travel of the intake and exhaust ports which are carried by the valve sleeve K. Likewise, it is only when the three bands, S-S1-S2, or E-E1-E2 intersect, that the transfer of the live or waste gases can take place to and from the cylinder.

Thus the two shaded areas of the diagram indicate, respectively, the intake and exhaust periods, the relative rates of opening and closing the ports and the timing being plainly apparent. It also is evident that toward the end of compression the intake ports in the auxiliary piston and valve sleeve coincide although the entire group of moving parts has passed out of range of the intake port in the cylinder wall, that

opening being masked by the working piston. It is during this period that ignition may occur, and the range permitted for varying the timing of the spark is indicated by the horizontal dotted line.

With the arrangement and relative cylinder volumes shown, the inventor claims to attain a theoretical efficiency  $18\frac{1}{2}$  per cent. greater than that obtainable with the standard type of engine having the same compression ratio, namely, 4:1. In other words, the theoretical gain resulting from completely exhausting the cylinder and affording a greater ration of expansion than of compression is represented by a gain of nearly one-fifth in efficiency, according to the inventor. Allowing a maximum of 20 per cent. efficiency for the standard type of engine, the total efficiency of the Sears engine would then be somewhere about 24 per cent. Admitting the added complexity, weight, engine friction and possible errors in performance resulting therefrom, the inventor nevertheless hopes in this way to improve upon the performance of the average motor in a thoroughly practical way.

In engines of more than two cylinders, it is said the extra fly wheel on the auxiliary crank shaft can be dispensed with, while other manufacturing economies can be brought about. It may be added also that by adopting a compression ratio of  $5\frac{1}{4}$ :1 and an expansion of  $8\frac{1}{2}$ :1 it is hoped to bring about an increase in efficiency of  $26\frac{1}{2}$  per cent.

#### The Female Flimflammer Visits New York.

It is perhaps on account of the scarcity of motor cars for sale—as indicated by interviews with one or two leading members of the trade—that the light-fingered gentry have taken to appropriating cars without the formality of paying for them. At any rate, they are showing more and more ingenuity in the manner of appropriation.

An entirely new development which has proven only too successful in a number of cases seems to have been invented by a young woman, variously known as Mrs. Morton, Spalding, Ortego, and a few other aliases, who is said to have operated her flimflam game in San Francisco, Denver and Chicago, among other cities.

The trick which she played on Frank J. Homan, of the Homan & Shultz garage on Fifty-ninth street, may be considered a fair example of the way in which the scheme is worked, with such small alterations as seem necessary under slightly different circumstances and in different localities. Homan advertised a Peerless 7-passenger touring car for sale for \$3,000, and a woman calling herself Mrs. Morton, with apartments at the Hotel Manhattan, called him up on the 'phone and asked him to bring the car to the hotel, so she might test it with him.

When Homan got to the hotel, he met the woman, who was accompanied by a young man in automobile togs, whom she introduced as her chauffeur. Homan took

the two on a trip through Central Park, driving them around for about two hours, and then took them back to the hotel. At the entrance to the latter the young woman asked Homan to accompany her to the writing room, where they could "talk business." The chauffeur remained outside to watch the car.

They talked for some time, and finally the woman left Homan, saying she would look for her husband to arrange for the purchasing of the car. While the woman was gone Homan went to the telephone booth to call up the garage. When he came out his car and the "chauffeur" were nowhere in sight. Thinking, however, that he had merely moved the machine further down the street upon orders from the traffic police, he thought nothing wrong about it and returned to the writing room, there to wait for the re-appearance of the young woman. He waited for more than an hour.

When finally he became worried, it was too late. His car, the young woman, the chauffeur—all had disappeared. The room in the hotel had only been engaged for two days, ostensibly in order to form an appropriate setting for the trick to be played.

The question "What became of the many cars stolen by the couple in their trip across the continent?" is puzzling the police of the various cities. Some indication as to what happened to the Peerless stolen from Homan, or the Packard stolen a few days before from John J. Burgess by a similar ruse, is furnished by the discovery of a couple of upholstered seats, a tire, cape top and windshield alleged to have been part of these cars in the store of a dealer in second hand accessories and furniture. The dealer proved to have bought them in good faith. Some of the cars were sold out West.

#### Ponderous Machinery for Automobile Work

Three pieces of machinery which in the aggregate will weigh many tons, are to be added to the equipment of the Franklin automobile factory, at Syracuse, N. Y. They are two large presses and a pair of squaring shears. On account of their weight they will be housed in a special building, for which concrete foundations are being laid.

The larger of the presses is 11 feet 5 inches high and 14 feet 6 inches long, and weighs about 25 tons. The other is 9 feet 2 inches high and 8 feet 2 inches long. Both will be used for pressing out such body stampings as doors, underbodies, seat sides and the like. The squaring shears will prepare the metal for the presses.

#### Danger in Using Detachable Rear Seats.

Considerable peril attaches to the use of detachable rear seats unless they are properly attached to the body of the car. The same applies to lazy-backs such as not infrequently are applied to rumble seats. Careless attachment or misplaced fittings may be the cause of a shocking accident.

## COOLING SYSTEMS FOR SMALL CARS

### Why One Designer Favors Use of Gravity Although not Opposed to the Thermo- Syphon Principle.

Because of the apparent economy of the thermo-syphon system of cooling, some little surprise occasionally is expressed that the plan has not been adopted to a wider extent, especially by those makers who are catering to the demand for low priced cars and who, therefore, might be expected to seek every means for reducing the cost of their products. Although the use of gravity circulation is increasing rapidly, its principle involves extreme care in design, so that it might be supposed that makers who have refrained from employing it hitherto have done so out of caution. Quite another reason is given by one designer who is noted for his success in the field of the small car, and who naively explains that he continues to adhere to the method of forced circulation for the very good reason that radiators cost more than pumps.

"The basis of the successful thermo-syphon cooling arrangement is to allow a maximum area for the flow of water, or, in other words, to use very large piping and big radiator capacity, together with a form of radiator such that it will not impede the circulation," he explains. "This implies larger piping and a larger radiator than are necessary where some form of pump is employed. But it is a curious fact, and one not generally recognized outside the draughting room, that radiators cost more to produce than do pumps. Hence, I consider it better economy to use a little less radiator than the gravity system would require; thereby also ensuring a good flow of water even when the system is partially clogged with sediment, as it is apt to be in the cheap car which has seen considerable service.

"At the same time, the gravity system involves a number of good points which the pump system cannot begin to secure. Among them is the acceleration in the rate of flow in proportion to the heating of the engine, with the consequent tendency to equalize the wall temperatures under all conditions of service to a better degree than is possible where the flow of water is regulated by the pump and so by the speed of the engine. What I prefer is really a compromise between the two systems, as a matter of fact.

"By using a fairly large radiator and piping of ample dimensions, and then introducing an impeller pump which really tends to accelerate the natural circulation of the water, I believe the proper effect is secured for the low priced car. You see," he concluded, "by that means, the water is given a certain amount of freedom to accelerate or retard, according to the mo-

mentary requirement of the cylinders, while at the same time its flow is rapid enough to effect a certain valuable economy in the amount of radiator which must be carried on the car, or the amount of radiator which the manufacturer must pay for out of his own pocket—so to speak."

### Unusual Features of Segment Tire.

Rubber blocks or segments arranged in a single row around the periphery of the wheel constitute the unusual feature of a new "Kelly-Springfield" tire, which has been brought out by the Consolidated Rubber Tire Co., of New York City and Akron, O., and which is just being placed actively on the market after a long period of experi-

mentation and test. Early types of sectional tires had their blocks rectangular in form, with the top and the bottom surfaces of the rubber pieces approximately the same size. In the new tire, however, the tread portion of each block is longer than the part which sets against the wheel, with the result that the slots separating the blocks have parallel sides and are no wider at the tread than at the wheel itself, eliminating all "V" effect. The truly radial effect of the blocks and slots is disclosed in the accompanying illustration, and the form of the tire permits the use of a single row of segments without a bumping or jarring effect, where previously it has been necessary to use two or more rows staggered to provide the effect of a continuous tread. Under the weight of load the sections meet at the outside edges, forming a continuous tread in actuality so far as the road is concerned, but providing a resiliency that would not be present were the tire itself continuous all the way around.

### When Door Hinges Should be Watched.

Where a touring car is habitually used by elderly persons or others who are inclined to use the tonneau doors as a balustrade to support them in entering and leaving, it is well to see that the hinges are of ample strength and well secured. Otherwise they may pull away sometime, with annoying, if not disastrous consequences.

## [SPLASH VS. FORCED LUBRICATION

### English Expert Criticizes Some of the Methods in Use and Points Out Ad- vantages of Splash.

It is not so very long since there were makers of automobiles who referred to a drip feed system where the oil was forced up to the drips by exhaust pressure, as forced lubrication; and there still are many hundreds of drivers and owners who appear to think that forced lubrication consists of pouring oil into the machine at stated intervals, and letting the engine do the rest. The main difficulty with them is the careless and indiscriminate use of the words "forced" and "pressure." Both these terms, of course, mean that lubrication is automatic, but the real pressure feed lubrication system is the one in which the oil is actually pumped at a pressure through a hollow crankshaft to the main bearings.

In a very able paper read by the English expert, G. H. Bailie, before the Royal Automobile Club recently, he discussed the much discussed subject of engine lubrication, and in doing so divided all oiling systems into two broad classes: (1) without splash, and (2) with splash.

"The object to be attained in lubricating a bearing," says Mr. Bailie, "is to prevent the two surfaces ever coming into contact by ensuring that there is always a film of oil between them. Take the case of a shaft, with a heavy flywheel, resting in its bearings. If the shaft is at rest and the bearings have a film of oil to start with, this film will remain if the pressure per square inch is below a certain limit. Above this limit the oil will be squeezed out, and the shaft and bearings will come in contact. If the shaft is rotating, the pressure per square inch of bearing may be largely increased without squeezing out the oil. So long as the shaft rotates this film of oil persists, and it makes no difference to the lubrication whether the further supply of oil is under pressure or not. Without the initial film of oil forced by pressure between shaft and bearing, the oil can not get between the surfaces in metallic contact, even though the shaft is rotating, before the bearing has been damaged.

"The case of the big ends of connecting rods of gasoline engines is, however, somewhat different. Here the surfaces are not permanently in contact, since the alternating pressure puts the opposite sides of the bearing under pressure at the end of the exhaust stroke and at the end of the suction stroke. The play in the bearing then leaves a space into which the oil can creep under capillary pressure. In big ends, therefore, no attention need be paid to getting an initial film of oil into the bearings."

Speaking of the necessity for an abundance of oil in the main bearings of gaso-

lene engines, Mr. Bailie states that this depends almost entirely upon the pressure per square inch between surfaces. Apart from any question of convenience and reliability, he thinks the advantages of forced lubrication somewhat overrated, mainly consisting in the facility of cutting down the bearing surface.

Comparing the advantages and disadvantages of forced lubrication in detail, Mr. Bailie classes as disadvantages:

"(1) The amount of oil getting to the big ends depends on the condition of the main bearings, and to ensure there being enough when the main bearings are slack, the pressure must be sufficient to give more than enough when the main bearings are tight, and this leads to too much being thrown off into the cylinders and their sooting up.

"(2) The viscosity of the oil varies so much when cold and when hot that the gauge indications mean nothing at all, and more often than not the gauge shows no pressure at all when the oil is hot and bearings are slack. This defect could be remedied by putting the relief valve, not where it generally is, on the pump, but as near as possible to the bearings. Then, however, the pump has to deliver under very high pressure when starting cold, and squirts oil out of its glands, or may strain its drive.

"(3) The pressure system may break down. Although indicators are fitted, no one looks at them frequently enough to prevent damage, for when a pressure system breaks down, lubrication ceases immediately. When the supply to an ordinary splash system breaks down, it is a long time before the oil level falls enough entirely to stop lubrication."

Somewhat counterbalancing these serious drawbacks, the English engineer names as advantages the smaller bearing surfaces which may be used, and the fact that oilways do not choke up.

He criticizes severely the system of lubrication employed by some makers, who have gone the length of forcing the oil through crankshaft, up the connecting rod, into the gudgeon pin, and through it to the cylinder walls. The difficulty, in his opinion, has not been to get the oil to the cylinders, but to keep it away from them. The throw-off from the connecting rods is always enough to lubricate the gudgeon pin, especially if a drip point is arranged on the top of the piston.

"The only other system without splash is the squirt feed," Mr. Bailie continues. "It is not common, and has no advantages that I can see. It does not give any pressure in the bearings and sends a lot of oil on the outside surface of the big end which gets thrown off into the cylinder. On a breakdown the lubrication ceases at once."

Taking up the splash lubrication devices, he divides them into splash in a large quantity of oil in the crank chamber and splash in small troughs.

"The trough system is really one for keeping the level right. Oil is pumped into

the troughs and overflows into the sump, so that the troughs are always full. I first heard of this system on the Siddeley cars, but it rapidly came into common use. It does away with the safety of the splash system, because the supply of oil in the troughs is not enough to continue lubrication for long if the pump fail. In the

#### Taxicab Call Boxes in Copenhagen.

In Denmark they have less trouble in calling taxicabs than do some people not a hundred miles from New York City, Copenhagen having recently installed a sys-

tem of call boxes, as shown in the accompanying photograph, and which are somewhat similar to the fire boxes used on this side of the big ditch. All the prospective patron has to do is to press a button and give the address where the cab is wanted. All the company's cabs have to report themselves by the same method on returning to the stand after each trip. The booking clerk in the main office consequently knows exactly how many cabs are standing idle and where they are.

present Wolseley cars the oil is pumped into reservoirs above the main bearings and also into the troughs. I think it would be better if the oil pipes were led into the main bearings so as to feed them under pressure, the pipes to the troughs being restricted sufficiently to give some pressure.

"Except that the lubrication depends on the pressure supply, this is, to my mind, the most perfect system. The pressure-feed is where it is most wanted, and where the throw-off can be kept out of the cylinders so that any quantity of oil can be

forced through the bearings, and the splash level is always right for each big end and under all conditions of running. When the splash level is in the crank chamber itself, this has to be divided up into two or four compartments, otherwise when going up or down hill the cylinder at one end smokes while that at the other runs out of its bearings. This entails providing two or four means of ascertaining the levels, unless, as is sometimes done, small holes are made connecting the compartments; this merely increases the length of hill a car can go up.

"Another objection to the splash system with the oil in the crank chamber is that the amount of splash varies so much with the speed of the engine. The splashed oil covers all the inside surface of the crank chamber and runs back into the pool at the bottom. When the engine is running continuously at a high speed, it is capable of splashing the oil up quicker than it can run back, so that the oil is kept at a level at which the bottom of the big end just touches it. When the engine runs slow, the level is considerably higher. The level, therefore, cannot always be right; in fact, I have been told by one manufacturer that he arranged for a higher level to be maintained in cars that were required to run in France, where high-speed runs can be kept up for a long time.

"The supply to the crank chamber to keep up the splash level is sometimes taken to the main bearings and sometimes straight to the crank chamber. In one case it is taken to the main bearings and passes through the crank chamber to the big ends. Such an arrangement is, I think, bad. The oilways in the crank chamber are necessarily small and are easily blocked up by dirt or congealed oil. Such oilways should be supplied only under pressure. The same applies, though to a lesser degree, to the supply to the main bearings. Where, as is common, a single drip feed supplies all the bearings, one branch may get blocked up, and no indication of blocking will appear so long as the others remain open.

"In regard to the regulation of the supply of oil, a pump forcing direct to the bearings supplies approximately a given quantity per revolution. Splash systems with the oil in the crank chamber probably supply less per revolution as the engine speed increases. Those with the oil in troughs probably supply more per revolution as the speed increases."

Summing up his argument for and against force lubrication, Mr. Bailie concludes that the only two systems which are really good are: "(1) The force feed into main bearings and through the crankshaft to the big ends, arranged with a relief valve near the bearings and large pipes, so that there is always a good pressure in the crankshaft and no fear of the ways blocking up. (2) A splash system with automatic means of keeping the level constant (not a constant supply), and preferably with force feed to the main bearings."

**"OPEN HOUSE" INSTEAD OF SHOWS**

**Dealers in Indianapolis and Toledo Depart  
from Usual Practice—But Rockford  
Hires a Hall.**

Quite different from the usual and accepted form of motor car show were the annual functions held last week by the dealers' associations of Indianapolis, Ind., and Toledo, O., both prominent trade centers. Instead of gathering their wares under one roof, where "elbow room" probably would be at a premium, with the likelihood that some would be shut out, the dealers decided to hold individual exhibitions in their salesrooms where all would have ample room to show their full lines. Sales rooms and garages were dressed in brilliant fashion for the occasion, while the main automobile thoroughfares also were decorated. During the week floral parades, gymkhana contests and attractions were held on an elaborate scale, with the sole object of interesting the public in motor cars. Show rooms were thronged with visitors who wandered among the numerous establishments inspecting the cars and all received a cordial welcome.

At Indianapolis, the spring opening was under the general direction and management of the Indianapolis Automobile Trade Association to which practically every car and accessory firm in the city belongs, so that all the establishments kept open house for the reception of the visitors, and there were multitudes of them, hundreds coming from all sections of the state. Much rivalry was manifest in the decorating of the various show rooms and this general and widely distributed effort produced some very handsome displays. Forty-five dealers staged cars from 80 factories, including some of the models first uncovered at the national shows, while the extensive accessory exhibits included practically everything in that category.

The real festivities did not commence until Wednesday, the two preceding days being given up to afford the public opportunity to visit the sales rooms and view the exhibits without being distracted by other attractions. On Wednesday the floral parade—the first ever held in the Hoosier capital—took place, some 40 machines participating. Some very handsomely decorated cars were in line and the judges had considerable difficulty in selecting the prize winners in the various sections. There were three divisions, and in the private owners' class, Louis G. Deschler's Chalmers car was unanimously awarded first prize. It was clothed in a solid mass of white Easter lilies, with wide strips of white ribbons hung along the sides and fastened to the hood in large bows, the whole arrangement being conceived to represent Springtime. Second prize in this division

went to a home product—a Marmon belonging to Edward G. Sourbier, which was adorned with American Beauty roses and carnations, and was, perhaps, the most expensively decorated machine in line.

W. A. Wildhack in an Oldsmobile carried off the dealers' prize, his machine being decorated with yellow chrysanthemums. In the "unique" class the big Packard truck of the Willis-Holcomb Co., was an easy winner. The car was rigged up to represent a gunboat, the details being faithfully adhered to and it made a most striking appearance. The prize winners received cut glass flower bowls, presented by the association, while in addition, the Waverley Co. offered a prize of \$50 for the best decorated Waverley machine in line.

On Thursday the Motor Speedway was the center of attraction, a series of gymkhana trials being held, to which the public was admitted free—in fact every function during the week was gratis to all who cared to enjoy it. There were six events, in which over 25 cars took part, and much interesting sport was served up to the spectators. Friday was given over to a huge industrial parade in which over 100 vehicles participated and the week's festivities closed on Saturday with an elaborate banquet at the Hotel Denison, at which over 300 prominent tradesmen were present, the speakers being well-known statesmen and motorists of national renown.

Among the cars which were unveiled for the first time this year were the Onlycar, Continental and McFarlan. The first named is a Long Island product of a type distinctly European, and has a single cylinder engine  $5\frac{1}{2} \times 10$ , rated at 12 horsepower. Natural water circulation, magneto ignition, cone or multiple disc clutch, selective sliding transmission and shaft drive are some of its distinguishing features. It is made in one style—racing runabout—and lists at \$700. The Continental is a Hoosier product hailing from Franklin, Ind., and comes in the form of a 4 cylinder, 35 horsepower vehicle, priced at \$1,400. Aside from its block motor, it embodies no radical departures from standard practice. Also a "native son" is the McFarlan car, a six cylinder machine with a 35-40 horsepower engine, and made in Connersville. Valves-in-the-head are the distinctive feature of its engine, but otherwise it does not depart radically from the ordinary. Although made in but one chassis it comes with several types of body.

The exhibitors and their wares were as follows:

Gasolene cars—Maxwell-Briscoe-Indianapolis Co., Maxwell; Fisher Auto Co., National, Stoddard-Dayton, Overland, Marion, Empire and Courier; Frank P. Fox Co., Pope-Hartford; Studebaker Bros Co. of Indianapolis, Studebaker; Hearsey-Willis Co., White, Mitchell and Hupmobile; Sterling Motor Car Co., Krit and Firestone-Columbus; Gibson Auto Co., Premier, Reo and Ford; Indianapolis Auto Co., Brush, Cartecar and Firestone; Reliable Auto Ex-

change, E-M-F. and Flanders; R. L. Sutherland, Continental; Finch & Freeman Auto Co., Rider-Lewis, Warren-Detroit, Auburn, Richmond and De Tangle; Willis-Holcomb Co., Packard; McFarland Six Sales Co., McFarland Six; Peck Motor Car Co., Cadillac; Shoemaker-Smith Auto Co., Parry; Walter D. Cost, Frayer-Miller trucks; A. T. Bunch, Abbott-Detroit; Diamond Automobile Co., R. A. C.; Henry Wilke, Winton; Van Camp Hardware & Iron Co., Randolph; M. L. Conley & Co., Austin and Onlycar; State Auto Co., Oakland; Henderson Motor Sales Co., Cole; Glide Auto Co., Glide and Great Western; Buick Motor Co., Buick, Oldsmobile and Welch; Co-Auto Motor Co., Fuller, Stearns, Jackson and Westcott; Indianapolis Motor Car Co., Rapid; Rambler Auto Co., Rambler; Morton Place Garage, Moline; Motor Car Sales Co., Peerless and Regal; Nordyke & Marmon Co., Marmon.

Steam cars—Hearsey-Willis Co., White.

Electric vehicles—Fisher Auto Co., Baker; Frank P. Fox Co., Rauch & Lang; Studebaker Bros Co. of Indianapolis, Studebaker; Hearsey-Willis Co., Waverley.

Accessories—Fisher Auto Co., Hearsey-Willis Co., Stewart-Carey Glass Co., Spacke Machine Co., Gibson Auto Co., Prest-O-Lite Co., Pumpelly Battery Co., Irvin Robbins Co., Sterling Motor Car Co., Kohl Mfg. Co., Fisk Rubber Co., National Refining Co., Wheeler & Schebler, Warner Instrument Co., G & J Tire Co., Guarantee Tire & Bicycle Co., Diamond Chain Mfg. Co., Haywood Tire Equipment Co., Empire Tire Co., R. J. Irvin Mfg. Co., Hercules Electric Co.

Because no hall in the city was nearly large enough to accommodate all who desired to secure space, Toledo automobile dealers this year departed from their past custom in staging their annual show, and decided to hold individual exhibitions in their salesrooms. So successful was this innovation that it is unlikely that they will adopt any other method of showing their new models in years to come. Never before were the local motor car sales rooms so gaily bedecked with bunting, palms and other potted plants as on Monday, 28th ult., when the week of "open house" was ushered in. In addition to the elaborate dressing up of the sales rooms, Madison street, the local automobile row, was strung with miles of wire and electric lamps, which at night converted that thoroughfare into a brilliantly illuminated passage. Inspection of the sales rooms was the order of the day on Monday, while Tuesday was occupied with a parade and gymkhana stunts. On the following days a varied program comprising a repetition of the events of the preceding days, together with some added features constituted the attractions. Throughout the week large crowds visited the various establishments and at the conclusion of the carnival week, the dealers expressed themselves as heartily satisfied with the results of their efforts.

Those who took part as members of the Toledo Automobile Dealers Association which conducted the exhibition, and the products which they displayed were the following:

Gasolene cars—Toledo Auto & Garage Co., Jackson, Stearns, Fuller; Norris-Toledo Motor Sales Co., American, Velie, Parry, Warren-Detroit, Gramm-Logan; Regal Motor Sales Co., Regal; Atwood Automobile Co., Overland Marion, Stoddard-Dayton,

Gamble Motor Car Co., Baker, Rauch & Lang.

Accessories—Stein Double Cushion Tire Co., Paragon Refining Co., Nagel Electric Co., Goodyear Tire & Rubber Co., C. Z. Kroh Mfg. Co., Toledo Rubber Co.

The first annual automobile show held in the Coliseum, Rockford, Ill., last week, under the guidance of the Motorists Association of Rockford served as an excellent ex-

the week. The show was a success both financially, and in general and the exhibitors expressed themselves as well pleased with the outcome. The exhibitors were.

Gasolene cars—Troller & Co., E-M-F., Flanders, Velie, Oakdale. Oldsmobile, Randolph; Joslyn Auto Co., Rambler, Overland. Wisco; Savage & Love Co., Haynes, Detroit-Dearborn; A. T. Roberts & Co., Marmon, Ford; E. P. Neymeister, Hudson, Moline; W. B. Taylor Co., Stoddard-Dayton,

GENERAL VIEW OF FIRST SHOW OF MOTORISTS ASSOCIATION OF ROCKFORD, ILL.

Matheson, Marmon, Hupmobile, Rapid; Union Supply Co., Chalmers, Hudson, Stevens-Duryea, Pierce-Arrow, Reo; Lichtie Automobile Co., Cadillac; Roberts-Toledo Auto Co., Ford; Cole Motor Sales Co., Cole; Blevins-Studebaker Auto Co., Studebaker, E-M-F., Flanders; Maxwell-Briscoe-Toledo Co., Columbia, Maxwell; Gamble Motor Car Co., Peerless, Winton, White; E. F. Leinhard, Rambler; Buick Motor Co., Buick, Welch-Pontiac, Welch-Detroit; Kirk Bros. Automobile Co., Thomas; Willys-Overland Co., Overland, Marion; Toledo-Mitchell Co., Mitchell; Standard Garage Co., Croxton-Keeton; Banting Machine Co., Whiting, Grabowsky; Hilt-Costello Co., Speedwell.

Electric vehicles—Toledo Auto & Garage Co., Detroit; Atwood Automobile Co., Waverley, Ohio; Lichtie Automobile Co., Columbus; Ohio Electric Car Co., Ohio; Blevins-Studebaker Auto Co., Studebaker;

ample of the creditable showing which can be made by an enterprising small town. Formed in the latter part of January, the association took hold with a will, and in the short interval laid plans for a show which was a credit to its sponsors.

It was ushered in with a parade in which nearly 200 machines took part, including many out of town cars, the surrounding territory having been thoroughly "papered" with announcements of the show. Every one of the local dealers, as well as several from other places took space, there being over 20 exhibitors, of whom 9 displayed cars. In the variety of exhibits it was about an even break, 21 brands of car and almost an equal number of accessory firms being in evidence. The decorations were of a pleasing nature and the attendance which began by filling the hall on the opening night, was most satisfactory throughout

Buick, Chadwick; International Harvester Co., I. H. C.; Standard Auto Co., Black-Crow; Lundstrom Bros., Mitchell.

Electric vehicles—W. B. Taylor & Co., Baker.

Motorcycles—L. J. Theiss, Thor, Excelsior.

Accessories—Rockford Electric Co., Fried-Ostermann Co., J. S. Joslyn, Tokheim Mfg. Co., H. J. Rett, C. L. Lee, Wigell Electric Co., E. V. Moore.

When newly purchased accessories are about to be attached to the car by store or garage employees, it may save considerable needless marring of the body if the owner inquires in advance exactly how the parts are to be mounted. He should see to it personally, that no exploratory holes are drilled in an effort to secure the desired location.

THE NEW  
**Rambler**

**T**HE New Fifty-Three Rambler Roadster is the latest addition to the Rambler line. Its pleasing lines and features, providing unusual comfort, combined with the power, silence and quality of the Fifty-Three touring car, has gained for this model immediate distinction.

The distance from dash to seats is thirty inches. This length, the tilted seats, the rake of the steering column, combines to provide the most comfortable and graceful position for the operator.

Motor: 34 H. P.

Bore and Stroke:  $4\frac{1}{2} \times 4\frac{1}{2}$  in.

Wheel Base: 109 in.

Wheels and Tires:  $36 \times 3\frac{1}{2}$  in. Hartford Dunlop.

Guards: Convex front and rear.

Body: Two passengers, low seats.

Color: Dark Brewster green, cream wheels.

Equipment: Magneto and dry cells, oil side and tail lamps, gas head-lights and generator, horn, trunk with two suit cases, full set of tools and jack.

Price: \$1,800. Top with side curtains \$75. Wind-shield \$40.

**Thomas B. Jeffery & Company**  
Main Office and Factory, Kenosha, Wisconsin  
Branches: Chicago, Milwaukee, Boston, Cleveland, San Francisco

## RECENT PATENTS.

947,494. Cranking Device for Internal Combustion Engines. Roland C. Hilton, Quincy, Mass., assignor, by direct and mesne assignments, to Hilton Manufacturing Company, Boston, Mass., a Corporation of Massachusetts. Filed No. 13, 1908. Serial No. 462,400.

1. In a device for cranking internal combustion engines, the combination with an engine shaft, a ratchet sleeve into which one end of said shaft extends and to which it is swiveled, means to permit the sleeve to rotate freely in one direction while preventing it from rotating in the opposite direction, and a starting crank shaft having a cam engagement with said sleeve whereby turning movement of the crank in one direction will advance it into said sleeve and into locking engagement with the engine shaft and backward movement of the engine shaft will cause the starting crank shaft to be disconnected.

947,496. Automobile Radiator. David Landau and Asher Golden, New York, N. Y. Filed Jan. 13, 1909. Serial No. 472,067.

1. An automobile radiator comprising a series of radiator tubes; a casing for said series of tubes having a front and back; and a plurality of plates extended alternately from the back and front of said casing to form a tortuous passage for the air about said tubes.

947,543. Vehicle Tire. Harvey S. Firestone, Akron, Ohio, assignor to Firestone Tire & Rubber Company, Akron, Ohio, a Corporation of West Virginia. Filed Nov. 18, 1905. Serial No. 287,986.

1. The combination with a wheel felly and a resilient tire mounted thereon, of side flanges secured to said felly and overlapping the sides of the tire, the overlapping portion of said flanges having ribs clenchingly engaging the tire and also having one or more laterally projecting lugs on the inner side of said ribs entering the sides of the tire and serving to prevent creeping of the latter, substantially as described.

947,566. Explosive Engine. Howard H. Wixon, Chicago, Ill. Filed March 11, 1907. Serial No. 361,698.

1. The combination with a two cylinder two cycle explosive engine of the class described, of a single acting auxiliary air pump, means to operate said pump at twice the speed of the engine, and means whereby the air charge is delivered alternately to each of the engine cylinders, substantially as described.

947,575. Storage Battery. Julius E. Haschke, Chicago, Ill. Filed Nov. 7, 1908. Serial No. 461,442.

1. In a storage battery, a plurality of glass cells arranged side by side, plates and electrolyte in each cell, closures for said cells, a central vent structure for each cell projecting upward from its closure, a casing for the cells providing three sides and a bottom permanently connected together, a side overlying the ends of the cells detachably connected to the permanent structure, and apertured at a level to permit of inspection of the electrolyte in the cell, and detachable top slats spanning the casing crosswise of the series of cells therein to overlie the ends of all of said cells and to leave therebetween an open area for the vent structures.

947,637. Motor Vehicle. Budd D. Gray,

Providence, R. I. Filed Jan. 6, 1909. Serial No. 470,916.

1. In a motor vehicle, in combination with the frame and rear axle, of a change speed gear casing pivotally supported upon a transverse member of the frame, a differential gear casing on the rear axle, a tubular member secured to said differential gear casing and slidably and rotatably connected to said change speed gear casing, a transmission shaft in said tubular member, a universal joint connecting said shaft to the source of power and having its axis in alignment with the pivotal axis of said change speed gear casing, and radius rods connected at one end to the rear axle and pivoted at the other end to the frame in alignment with the said axis.

947,647. Induction Generator for Ignition Purposes. Henry J. Podlesak, Chicago, Ill., and Tesla E. Podlesak, Morristown, N. J. Original application filed Sept. 25, 1901. Serial No. 76,559. Divided, and this application filed Jan. 28, 1908, Serial No. 413,070. Renewed Feb. 10, 1909. Serial No. 477,251.

1. In an inductor generator for ignition purposes, the combination of a permanent magnet, a pair of pole pieces each held in magnetic contact with one pole of said magnet and having three polar projections, a coil of wire in inductive relation to the middle polar projections on said pole pieces, and an unwound inductor movable relative to said polar projections to concentrate the magnetic flux emanating from the poles of said magnet first outside of said wire wound polar projections and between said pole pieces, then across said wire wound polar projections and then outside of said wire wound polar projections and between said pole pieces in rapid succession.

947,653. Spring for Vehicles. Ludwig Sgal and Josef Schwanda, Vienna, Austria-Hungary, assignors to Pioneer Engineering Syndicate, Limited, London, England. Filed March 30, 1906. Serial No. 308,887.

1. The combination, with a vehicle frame and its axle, of a lever fulcrumed to the frame, a leaf-spring arranged between said lever and the axle, a spiral spring inserted between the frame and the lever and secured to the frame substantially at the fulcrum point of the lever.

947,674. Automobile Fender and Buffer. Antonio Camarda, New York, N. Y. Filed March 8, 1909. Serial No. 482,087.

1. The combination with a steering bar, of a two-part fender, means for connecting said parts of the fender with the opposite ends of said steering bar, whereby when one part of the fender is struck, the steering bar will be shifted, for the purpose specified.

947,683. Friction Brake and Clutch. William C. Marsh, Dunkirk, N. Y. Filed Feb. 11, 1908. Serial No. 415,429.

1. A friction brake, embodying a member having a braking surface, a brake shoe, means for applying the same to the braking surface so as to gradually increase its braking action thereon, a second brake shoe, a movable block to which said second brake shoe is pivoted.

947,705. Throttle Mechanism for Automobiles. George T. Taber, Pittsburg, Pa. Filed Sept. 3, 1909. Serial No. 516,127.

1. In a throttle valve mechanism for automobiles, the combination with the engine, of a throttle valve controlling the supply of motive fluid thereto, cranking mechanism outside the automobile, and connections

leading from said throttle to a point adjacent to said cranking mechanism.

947,706. Locking Device for Automobile Starting Cranks. John van Tekelenburg, Long Island City, N. Y., assignor of one-third to Adam Leidich, Brooklyn, N. Y., and one-third to Walter Muller, New York, N. Y. Filed Dec. 30, 1908. Serial No. 469,955.

1. The combination with a recessed shaft head, of a recessed crank mounted thereon, a tumbler rotatably arranged in the recess of the crank, means for locking said tumbler, and a key for releasing and a key for rotating said tumbler.

947,712. Carburetter. Garrett W. Henricks, Indianapolis, Ind., assignor, by direct and mesne assignments, to Improved Carburetor Company, a Corporation of Indiana. Filed Jan. 10, 1908. Serial No. 410,179.

1. A carburetter provided with an air inlet passageway, a main valve for controlling the passage of air therethrough, which valve is adapted to yield to the pressure of the incoming air, an emergency valve located in said air inlet passageway and preceding said main valve, a spring for normally holding said emergency valve in an open position, and means for temporarily closing said emergency valve.

947,968. Supporting Axle for Motor Vehicles. Budd D. Gray, Providence, R. I., assignor to American Locomotive Company, New York, N. Y., a Corporation of New York. Filed May 21, 1908. Serial No. 434,014. Renewed July 16, 1909. Serial No. 508,006.

1. A supporting axle for motor vehicles, comprising a central, annular body adapted for the reception of driving mechanism, tubular supporting members continuous with and oppositely projecting from said central body, a spacer fixed in the central body, and tubular liners fixed in said supporting members and connected at their inner ends to said spacer.

948,064. Process of Making Tire Shoes. Frank A. Seiberling and Will C. State, Akron, Ohio; said State assignor to said Seiberling. Filed May 7, 1909. Serial No. 494,588.

1. In the operation of building open-bellied pneumatic tire shoes from layers of fabric on ring-cores, the process of first constructing an annular bead, hardening the same and then applying it in this annular and hardened form to the ring core, substantially as described.

948,111. Battery Box. Russell W. Magana, Holyoke, Mass. Filed Oct. 1, 1908. Serial No. 455,737.

1. The combination, of a battery box, a resilient contact affixed therein and capable of engaging one of the binding posts of a battery, a bracket also fastened within said box, and a flexible connection attached at one end to said bracket and having attached to its other or free end a contact capable of engaging the other binding post of said battery.

948,193. Pneumatic Tire for Vehicles. Charles E. Titus, Springfield, Mass. Filed July 20, 1907. Serial No. 384,805.

1. An armor for pneumatic tires comprising a plurality of separate tread members, and means for fastening each tread member separately to the tread portion of the tire,

# Lubricator Patent

## SUSTAINED

In a decision dated March 24th, 1910, the United States Circuit Court for the Northern District of Illinois declared our Lubricator Patent No. 822,900 valid and infringed in our suit against the Lavigne Manufacturing Company and Brandenburg & Company and injunction was ordered to issue. The claims sustained cover means of regulating and indicating the operation of the pump extending from the inside of the reservoir through the cover.

We also own patent No. 947,449 dated January 25th, 1910, for lubricating mechanism, the claims of which cover all methods of suspending the pump operating and controlling mechanisms from the cover and removable with it.

The claims of these two patents cover practically every force feed lubricator now manufactured and sold for automobile and marine engine use.

Infringement of these patents will be vigorously prosecuted.

**McCORD MANUFACTURING COMPANY**  
**Detroit**

said tread members being arranged in continuous relation in parallel rows and intermatching throughout the series, thereby presenting a continuous unbroken armored surface, said members also having edges formed with beveled ridges which abut the ridges of the adjacent members and form therewith projections having inclined sides.

948,279. Gasolene Feed. Albert W. Hoffer, Bottineau, N. D. Filed Feb. 24, 1909. Serial No. 479,682.

1. In a device of the class described, a carburetter, a fuel tank, an auxiliary fuel tank upon the opposite side of the carburetter from the main fuel tank and near the carburetter, the top of the auxiliary tank being at approximately the level of the bottom of the main tank, a pipe leading from the bottom of the main tank and discharging near the top of the auxiliary tank, a pipe leading from the auxiliary tank to the carburetter, a strainer within the auxiliary tank between the openings of said pipes, a branch leading from the first named pipe to the carburetter, and a valve in the branch pipe.

948,317. Motor Vehicle. Rodolphus Fuller, Detroit, Mich. Filed March 8, 1909. Serial No. 482,047.

1. In a truck for motor vehicles, the combination of a truck frame, an axle, driving wheels on said axle, a motor located at one side of the axle adjacent to one wheel with its shaft extended toward the other wheel, a second motor located at the opposite side of the axle adjacent to the other wheel with its shaft extended toward the wheel at the opposite side of the truck, variable speed transmission mechanism located upon the extended end of each motor shaft, a pinion on each motor shaft actuated by each transmission mechanism, a counter shaft adjacent to each motor with one end extending toward the adjacent truck wheel, means for transmitting motion from each of said counter shafts to said wheels, and a gear on the opposite end of each counter shaft to engage said pinions.

948,337. Vehicle Washer. Edward Muller, Weehawken, N. J. Filed May 24, 1909. Serial No. 497,965.

1. In a device of the character described, a fixed inlet pipe provided with an elongated downwardly extending portion, a laterally disposed delivery pipe provided with a hose connection at the outer end thereof and with an upturned portion at the inner end thereof closely fitting the interior of the downwardly extending portion of the inlet pipe and rotatably supported therein, and means for engaging said laterally disposed delivery pipe intermediate the ends thereof and constituting the sole support therefor.

948,341. Motor Vehicle. George W. Perry, Jr., Peoria, Ill., assignor, by mesne assignments, to Avery Company, a Corporation of Illinois. Filed July 21, 1906. Serial No. 327,185.

1. In a steering gear for motor vehicles, the combination of a motor frame, a motor thereon, vehicle-supporting and driving wheels, power transmitting mechanism interposed between said motor and said driving wheels, and suitable steering wheels, of power transmitting mechanism interposed between said motor and said steering wheels and including positively acting power transmitting means, and means in addition to said positively acting power transmitting means for frictionally controlling the same.

948,371. Taximeter. Alphonse Jean-Baptiste Edouard Darras, Paris, France. Filed Feb. 23, 1909. Serial No. 479,492.

1. In a taximeter, the combination with a continuously driven spindle, of two notched discs secured thereon, the notches being directed opposite and displaced to one another, a spring actuated spindle, means for transmitting movement from the first named spindle to the latter and a disc on said spring actuated spindle having stepped displaced projections on its two faces and adapted to co-operate with the two notched discs to periodically stop and release the spring actuated spindle and to thereby cause the latter to execute an intermittent movement.

948,389. Tire for Wheels of Vehicles. John Cairns, Willenhall, South Staffs, England. Filed July 29, 1908. Serial No. 446,005.

A vehicle wheel tire structure comprising in combination, a plurality of hollow studs of yielding material each provided with an annular groove near its base, a plurality of circular portions receiving the studs and having flanges engaging the grooves to secure the studs and confine the air therein, and pieces of canvas interposed between the bases of said studs and said circular portions, substantially as and for the purpose set forth.

948,483. Inductor Generator for Ignition Purposes. Henry J. Podlesak, Chicago, Ill., and Tesla E. Podlesak, Morristown, N. J. Original application filed Sept. 25, 1901, Serial No. 76,559. Divided an' this application filed Jan. 28, 1908. Serial No. 413,069.

Licensed under  
Selden Patent.

# HAYNES

## A DISTINCT ADVANCE IN MOTOR CAR CONSTRUCTION

The Haynes is the 1910 sensation, for never before has a high-class car of established reputation sold for \$2,000.

Never until now has the automobile purchaser been offered such value in a motor car.

It is the only car of established reputation selling at a moderate price.

The Haynes Model 19 is the last of a line of achievements in motor car building that dates from the time Elwood Haynes built the first American Motor Car in 1893.

Mr. Haynes has been a leader for many years in practical automobile improvements. He was the first manufacturer to use nickel steel and aluminum in a motor car. He was the first to use a magneto—the first to introduce roller bearings. So it is not surprising that the Haynes organization should be the first to produce a car of known quality at a moderate price.

## Haynes Model 19

### \$2000 Fully Equipped

has the same graceful lines, the same rich upholstery, and the same quiet-running quality that cost hundreds of dollars more in other cars, and it has certain snappy features in addition not to be found in any other car.

At only \$500 more than the cost of a popular-price car you are offered a car that can only rank with cars costing \$1,000 more.

Do not buy any machine until you know the Haynes. We will be glad to arrange a demonstration at some time and place that will suit your convenience.

Send for our handsome descriptive booklet today.

**HAYNES AUTOMOBILE CO.**  
Station C KOKOMO, IND.

1. In an apparatus of the class described, the combination of an igniter mechanism associated with an internal combustion engine, a shaft projecting from the engine casing, a magnetic field frame adjustably mounted upon said shaft and provided with a winding, a movable inductor for varying the magnetic flux through said winding, an arm pivotally connected at one end with said field frame and at the other end with said igniter mechanism, and means for actuating said arm for simultaneously adjusting said igniter mechanism and said field frame.

948,489. Core for Manufacturing Pneumatic Tires. John K. Williams, Akron, Ohio, assignor of one-half to The Williams Foundry and Machine Company, a Corporation of Ohio. Filed Oct. 26, 1908. Serial No. 459,572.

1. A collapsible core for manufacturing tires comprising an annular body having as a part thereof a removable section adapted to laterally overlap at least one end of the remaining portion of the body, and means extending through the overlapping portion of said removable section and the remaining

portion of the body for detachably holding said removable section in position.

948,612. Carburetter for Combustion Engines. Richard E. Krause, Cleveland, Ohio, assignor to The Krause Carburetter Company, Cleveland, Ohio, a Corporation of Ohio. Filed April 6, 1908. Serial No. 425,383.

1. In a carburetter for a combustion engine, a mixing chamber having an outlet for feeding a combustible mixture to the engine; several air receiving ducts connecting and adapted to communicate with the said chamber, which ducts are provided with air inlets continually communicating with the external atmosphere and have other air inlets; means whereby the supply of air to the ducts through the last mentioned air inlets is controlled or regulated; a suitably operated valve covering the discharging ends of at least a plurality of the said ducts in its fully closed position and arranged to successively uncover the valve covered ducts in actuating the valve from its fully closed into its fully open position, and means for supplying fluid fuel to the ducts.

948,807. Tire Pump for Motor Vehicles.

Martin L. Bastian, Philadelphia, Pa., assignor to Olney Automobile Company, Limited, Philadelphia, Pa., a Pennsylvania Limited Partnership. Filed Jan. 16, 1909. Serial No. 472,608.

1. A pump for inflating tires including in combination, high and low pressure cylinders, pistons operating in said cylinders, piston rods connected to said pistons and extending in opposite directions, means for reciprocating said piston rods comprising a device having said piston rods attached thereto, and a valve connection for connecting the low pressure cylinder with the high pressure cylinder, whereby said low pressure cylinder is exhausted into the high pressure cylinder during one half stroke, and from thence into the tire to be inflated during the following half stroke under compression of the high pressure cylinder.

948,997. Wheel, Maurice Lachman, New York, N. Y., assignor to Welded Steel Wheel Company, New York, N. Y., a Corporation of New York. Filed April 29, 1909. Serial No. 492,961.

1. A wheel composed entirely of metal

## The Tire That's Oversize

Each Goodyear Detachable Automobile Tire is considerably larger than its rating. So in Goodyear Tires you get extra size plus extra quality. Larger tires mean increased mileage, less punctures and blow-outs and more satisfaction.

Because of this Oversize feature and the other Trouble-Saving and Extra Service-Giving features to be found only in Goodyear Tires, we have been awarded contracts from 44 Automobile Manufacturers to equip 36% of the estimated 150,000 cars to be made in 1910. The contracts total up to the greatest number of tires ever ordered from a single tire maker in the history of the automobile industry.

See what this oversize value amounts to in a 4-inch tire. Big extra mileage.

**GOOD YEAR**

### Straight-Side Automobile Tires

are guaranteed against Rim-Cutting, Creeping and Coming Off. The outer sides of the tire are straight, permitting the use of a rim with a wide rounding lip where it holds the tire in place. There are no sharp edges—nothing to cause a rim-cut, even though the tire be ridden flat. 64 tapes of piano wire are vulcanized into the base of each tire (see white spots in section). These contract with inflation until the tire grips the rim so tightly that it can never creep, even though but partially inflated. No tire bolts need to be used. Goodyear Tires are supreme in resiliency and are easiest removed and replaced. Send for our valuable book, "How to Select an Automobile Tire." It's brimful of "Tire Sense" and is free for the asking.

**SELDEN LIGHTNING TO STRIKE AGAIN**

**Ford Files His Answer and Meanwhile A. L. A. M. Prepares Other Suits—Some of Those to be Sued.**

Progress in the clearing up of the difficulties attending the entering of the actual decree in the Selden case was marked this week by the filing of the Ford answering papers, as to why the name of the Columbia Motor Car Co. should not be substituted for that of the Electric Vehicle Co., as joint complainant with George B. Selden. The United States Circuit for the Southern District of New York, which sustained the patent, will hold the hearing as to the change of name on the 18th inst.

Such delicacy, diplomacy, caution and smiling tactfulness has characterized the policy of the Association of Licensed Automobile Manufacturers toward unlicensed makers since the decision sustaining the Selden patent, that an impression gradually has been created in some quarters that the Association perhaps would not assume any terrifically formidable role and would content itself with using moral suasion on the public in an effort to induce the latter to buy only licensed cars. That the A. L. A. M. program contemplates real aggressiveness, however, is indicated by the advance notices which have been permitted to leak out concerning infringement suits that have been prepared against over half a dozen of the "independent" makers and which are due for almost immediate filing.

It is suggested by some of those intimately in touch with Association affairs that the time intervening between the Selden decision and the present has been a period for straightening out matters as to who the new licensees should be, before the real warfare started, and for giving the unlicensed manufacturers, their agents and their prospective customers fair warning of the patent situation before actually commencing the litigation campaign. Having

utilized the time, also, for thorough and careful preparation and plans of attack, the association is now represented as about to move on a list of makers, including the Abbott Motor Co., Demotcar Co., Owen Motor Car Co., Warren Motor Car Co., and Paige-Detroit Motor Car Co., all of Detroit, Mich.; the Velie Motor Car Co., Moline, Ill., and the Parry Car Co., of Indianapolis, Ind. These makers, it is pointed out, all commenced active production since the rendering of the Selden decision, and are, therefore, to be given less kindly consideration, according to the licensed view.

**United States Motor Acquires Sampson.**

The United States Motor Co. has bought the Alden Sampson Mfg. Co., of Pittsfield, Mass., thus signaling the entrance of a \$16,000,000 merger enterprise into the commercial field, in addition to that of pleasure cars. The Alden Sampson plant at Pittsfield is to make a wide line of commercial vehicles, and will be enlarged with additional buildings, machinery and other equipments, as it has been less conspicuous in the past for the quantity of its production than for advanced engineering and extensive experimentation.

**Cartercar Joins National Association.**

The National Association of Automobile Manufacturers held its monthly meeting at the New York headquarters on Wednesday 6th inst. The Cartercar Co. of Pontiac, Mich., was admitted to the association's membership ranks, and one or two minor changes were made in the personal representation of other companies, aside from which the session was largely routine.

**Boynton to Become Mosler's Manager.**

Charles C. Boynton has resigned as buyer for the Excelsior Supply Co., of Chicago, Ill., his resignation to take effect on the first of June. At that time he will become general manager for A. R. Mosler & Co., of New York, manufacturers of Spit-Fire plugs and B-M carbureters. His successor at the Excelsior company will be Mr. Grubb.

**SHARP TALK AT A. L. A. M. SESSION**

**Two Members are Verbally Castigated—Briscoe Hotly "Sails Into" Franklin, and Some Facts Come Out.**

Some clearing of the atmosphere in the Association of Licensed Automobile Manufacturers took place when the members gathered at the New York headquarters on the 6th inst., and the process was highly meteorological in its character in respect to being accompanied by storm conditions and severe electrical discharges. In fact lightning and thunder were conspicuous in the session, but a spell of pleasant weather is looked for now that it is over. To change the metaphor, two members were "spanked" in order that family peace might be restored.

Not a few of the members for some time have been wanting to give expression to views regarding the boldness of the "wizard" of the General Motors Co. in publishing the Licensed quarterly figures of royalties and production, which data most of them have regarded as essentially confidential in character and not something to be used in stock selling campaigns. In consequence of this feeling the meeting was plunged early into a consideration of what steps should be taken to make the offending "Napoleon of the Industry" feel the weight of their displeasure at his alleged violation of confidence, and the point also was raised as to whether it would be best to discontinue the issuance of statistical quarterly reports to the members, in order that further unpleasant incidents of the kind might be avoided.

The proposal to cease supplying the statistics was warmly discussed, but it finally was decided that the reports should not be discontinued, as the information is of a character to which the members are entitled. Nevertheless, to prevent their unwarranted broadcast publication in the future and to make the Buick offense clear, resolu-

tions of censure were adopted, which might well make the left ear of W. C. Durant burning hot. Durant himself was not present, having been badly shaken up and bruised when a car in which he was driving with A. F. Brush was upset near Pontiac, Mich., on the 4th inst.

An even livelier portion of the session took place when Benjamin Briscoe, head of the United States Motor Co., broke loose as to some of his grievances against H. H. Franklin. The latter was accused of having expressed considerable adverse criticism against the association's recent policies in general and of having written letters making suggestions that Briscoe, in purchasing the Columbia Motor Car Co. for merger in the United States Motor Co., was guilty of ulterior motives in relation to the ownership of the Selden patent. It also was claimed that the Franklin had indicated that there was altogether too much "wholesaling" of licenses, and that "everybody" was being given a license if the price was forthcoming.

With indignation and heat, Briscoe repudiated any such intimations, either as to himself or the Licensed Association, and did not spare language in doing so, and in expressing his opinion of Franklin. The impossibility of his in any way controlling the Selden patent, despite the fact that he controls the Columbia Motor Car Co., which owns the patent, was made clear by reference to the contract terms under which the A. L. A. M. exercises its control. The charge that the Association was "taking in everybody" was pronounced ridiculous, particularly as it was brought out that the association has rejected the applications of no less than 78 manufacturers. As a result of Briscoe's presentation of Franklin's course, the latter, who was not present at the meeting, also was given a figurative chastisement in the woodshed.

A return of 75 cents per foot on the last Garden show was voted, in accordance with the recommendation of Colonel George Pope, chairman of the show committee. Confirmation and approval was given for the plan for a two weeks show at the Garden in 1911, the first week to be for pleasure cars and the second for commercials.

#### Kissel to Produce Electrics, Too.

The Kissel Motor Car Co. of Hartford, Wis., is stated to be about to go into the manufacture of electric vehicles in addition to its present line of gasoline cars, and to be taking up commercial models as well. The Hartford Plow Co., owned by the Kissels, has been sold by them as to machinery, patterns, patents, and the like, and the plant is to supplement the present automobile factory. A foundry and a drop forge plant will be added.

#### Chalmers in a Castings Foundry.

The Fairview Foundry Co., of Detroit, Mich., which recently was organized for the purpose of making automobile castings, has

completed its buildings and is installing its equipment. The foundry consists of two separate buildings, one for iron casting and the other for aluminum and brass work. All of the castings for the Chalmers Motor Co. will be made by the Fairview company, which also will reach out for other business. F. L. Bromley, is president of the concern, with J. W. Thompson as vice-president and C. A. Pfeer as secretary and treasurer. The board of directors consists of these officers and Hugh Chalmers. As a practical foundryman, Bromley has organized several foundry companies which specialize in the automobile trade.

#### Still Spreading Out in Detroit.

No abatement is observable in Detroit's projection of new factories and extensions for concerns in the automobile trade, among the most recent to be announced being the buildings for the Grabowsky Power Wagon Co., for the Warren Motor Car Co., and for the Detroit plant of the Long Mfg. Co. of Chicago. The Grabowsky plant is to be on a nine acre site at Mount Eliot and the Belt Line, the main building being 300 by 62 feet and the body department structure being 200 by 40. The Long Mfg. Co. of Chicago, producing radiators, tubings and parts, recently raised its capitalization from \$100,000 to \$300,000, and as a result of this move has arranged for a Detroit factory 325 feet long, at 1430-38 Michigan avenue. The new Warren plant is on Holden avenue, near Lincoln, and the first building is to be 600 by 60, of brick, stone and concrete. A second building, 450 by 60, is to be completed next fall, and a third building by next January.

#### Unusual Feature of Hayes's Plant.

The Hayes Wheel Co. of Jackson, Mich., having been confronted with a situation peculiar to the supplying of wheels to motor car manufacturers, has added to its factory buildings a fireproof warehouse, somewhat unusual in its purpose and arrangement. The entire space in the building is given over to the storage of hubs and rims, supplied by the company's customers for the building of wheels. Each customer is allotted ample storage space for the maximum quantity of unassembled material which he may have on hand at any time at the Hayes plant. As the warehouse stands apart from the other buildings, a belt carrier system is being installed to connect it with the assembling floors in the manufacturing buildings.

#### "Dan Patch" Coming via Minneapolis.

With the makers remaining anonymous, a series of cars to be known as the Dan Patch line is to be put on the market by the M. W. Savage Factories Co., of Minneapolis, Minn., which states that it has bought the entire output of an Indiana automobile factory for the coming year. The line includes about a score of models, from 40 horsepower touring cars to motor bug-

gies and commercial vehicles, and is to be distributed under the direction of E. B. Savage, who will institute a national selling campaign.

#### More Room for the Whitney Chains.

The Whitney Mfg. Co. of Hartford, Conn., making Whitney chains and other products for automobile application, is awarding contracts for the erection of a five story addition to its plant at Hamilton and Bartholomew street, to be ready for occupancy by October. The building will be reinforced concrete, with brick work on the outside tiers, and will add 24,000 square feet to the 80,000 feet already provided. A small single story building for storage purposes also will be put up.

#### Lauth-Juergens to Settle in Ohio.

The Lauth-Juergens Motor Car Co. has been incorporated in Fremont, O., with a \$150,000 capital, for the purpose of taking over the business of the Lauth-Juergens Co. of Chicago, Ill., which has been making cars in a small way for several years. Manufacturing operations will be transferred to Fremont, where a new plant will be ready for occupancy some time in May. Both pleasure and commercial cars are to be built.

#### Brush to Build Another Addition.

Despite the fact that the Brush Runabout Co., of Detroit, Mich., is little more than settled in its new factory, further factory additions already are being started. Incidentally indicating its confidence as to future permanency and stability, the company also is arranging for the building of a number of houses not far from the plant, for the occupancy of its workmen and their families.

#### To Manufacture Two-Cycle Trucks.

The Willet Engine & Carbureter Co., of Buffalo, N. Y., which has developed a two-cycle engine, has arranged for incorporation with \$1,000,000 capital, and announces its intention of erecting a large factory. It is stated that the concern will specialize on a 1,000-pound truck to sell at \$1,400, and furnished with its new two-cycle power plant.

#### Tire Company Gets Jersey City Factory.

The Rubber Co. of America, marketing an automobile tire, has purchased the factory of the International Watch Co., in Jersey City, N. J. It is announced that a quantity of tire making machinery is to be installed at once and active production commenced in the near future.

#### Miller to Make Palmer Truck Tire.

The Miller Rubber Co., Akron, Ohio, has acquired the right to manufacture the Palmer motor tire, the invention of H. A. Palmer of that city. The Miller company quite recently added automobile tires to its production.

**CARLSON PATENT IS SUSTAINED**

**Wins His Suit Against Maxwell-Briscoe—  
Decision May Affect All Two-Cylinder  
Opposed Engines.**

Except for the fact that a diminished relative importance has been given the two cylinder motor in consequence of the use of the four and six cylinder types, a patent decision which has just been given in favor of the Carlson Motor Truck Co., of Brooklyn, N. Y., and adversely to the Maxwell-Briscoe Motor Co., of Tarrytown, N. Y., might be regarded as of considerable concern to motor car manufacturers, since it involves an arrangement of the crank case cover and cam operating mechanism on horizontal opposed motors that is quite general in practice. The decision is the result of an action brought against the Maxwell-Briscoe company on April 10, 1907, by Charles A. Carlson for alleged infringement on his patent, No. 797,555, relating to improvements in internal combustion engines, especially the removable cover containing cam shaft and slides, as employed in the horizontal opposed types.

On appeal the United States Circuit Court for the Southern District of New York, with Judge Hazel presiding, has found for the complainant. Carlson assigned his invention to the Carlson Motor Truck Co., of Philadelphia, Pa., some time after the litigation was started, so that the decision comes as a victory for the company, although the prosecution originally was instituted by the inventor personally. It is asserted that the sustaining of the patent will be of wide effect among those makers whose products include cars having the horizontal opposed type of engine.

**Pierce-Arrow Takes up Trucks.**

Although it has been known for some time among the initiated, that the Pierce-Arrow Motor Car Co., of Buffalo, N. Y., has had an experimental commercial truck on the road under test, the actual announcement that the company is to manufacture motor trucks has not been forthcoming until this week. In connection with extensive additions to the factory now in progress a special truck building, 84x300, and four stories high, is to be erected. Although no structural details have been given out, it is indicated that the Pierce-Arrow truck will be for heavy loads and that its horsepower will be large compared with the average ratings of commercial vehicles.

**Morris Grabowsky Leaves the Rapid.**

Morris Grabowsky, who with his brother, Max Grabowsky, was one of the promoters of the Rapid Motor Vehicle Co., of Pontiac, Mich., and has been with the concern since its beginning in 1905, has tendered his resignation, to take effect immediately. He in-

dicates that he will be identified shortly with another commercial vehicle enterprise. Further changes have been made in Rapid affairs by the appointment of George A. Horner as general manager of the company. He became associated with the company several years ago in the capacity of accountant and cost system expert, and latterly has had a large hand in the management and financial direction of Rapid affairs.

**Lewis Sails for European Visit.**

With a view to keeping in touch personally with the development of European markets for Mitchell cars, Captain William Mitchell Lewis, of the Mitchell-Lewis Motor Co., Racine, Wis., sailed yesterday (Wednesday) for "the other side," accompanied by Mrs. Lewis, together with their son and daughter. He will remain abroad until the latter part of May, meeting J. W. Bate, the company's engineer and superintendent, who preceded him. The business trip will include England, France, Italy and Germany.

**How Owen is Using a Tent.**

Tents have been employed by automobile manufacturers for temporary factory addition purposes, but their use on the "automobile row" of a large city as a display room is more strikingly novel. Pending the time when he can get suitable Chicago quarters, Ralph R. Owen, of the Owen Motor Car Co., Detroit, Mich., has arranged for a tent exhibit in a lot between Twelfth and Thirteenth streets, in the heart of the Windy City's "automobile row."

**United Manufacturers to Move.**

The United Manufacturers, comprising five prominent accessory concerns, will remove their main offices in New York City on May 1 from the present address, at Broadway and 76th street, to Motor Hall, 250 West Fifty-fourth street. The new offices will have 10,000 square feet of floor space, affording considerably more room than the two floors in the Jones Speedometer building, which at present is utilized as headquarters.

**Mr. Jeffery's Body En Route to America.**

The remains of Thomas B. Jeffery, the Kenosha manufacturer, who died in Pompeii, Italy, on the 2d inst., and Mrs. Jeffery, who was with him when he expired, will reach New York on the Hamburg-American steamer Cincinnati, which is due April 19th. They will be met by Mr. Jeffery's son, Charles T., who will accompany them west, where the burial will take place.

**Bacon Retires as Haynes Manager.**

Richard Bacon, Jr., has resigned as sales manager of the Haynes Automobile Co., of Kokomo, Ind., a position which he assumed several years ago after a wide general experience in the trade. His future plans are not as yet announced.

**CONANT UNFOLDS HIS SHOW PLANS**

**Promoter of "Independent" Show in New York Styles it "Eleventh Annual"—  
Some Considerations Involved.**

Further announcement of the plans for an "independent" show at Grand Central Palace, New York, December 31 to January 7, reveal that it is to be termed the Eleventh Annual International Automobile Show and that the management is to be conducted by the Journal Company of Troy, N. Y., of which C. C. Conant, the promoter of the exhibition, is president. Prospective exhibitors apparently enjoy little or no prospect of the rebates which have been the portion of a majority of the exhibitors at previous Grand Central Palace shows, as the proposition is strictly on a buy and sell basis and does not appear to involve an association or co-operative movement on the part of the exhibitors.

"The management is in the hands of people who have had fifteen years experience in conducting successful trade shows," it is explained. "They are not promoters, but a corporation with ample capital, commercial standing and experience. Space will be allotted in order of receipt of application—a method which is entirely different to what has prevailed in the past."

Although the show seeks to be an "eleventh annual," it is given by interests heretofore associated with the carriage trade, in the promotion of carriage shows and in the publication of the Carriage Dealers Journal. Several forces would appear to militate against its passing off as smoothly as its predecessors at the Palace, not the least of which is the fact that the National Association of Automobile Manufacturers has sanctioned only the Garden show and that at the Coliseum at Chicago. While the "independent" or unlicensed manufacturers have no interest in the Garden show, it is possible that many of them would not care to forfeit their right to exhibit at Chicago where licensed and "independent" makers have spaces side by side, as in previous years. Those makers who choose to exhibit at shows not sanctioned by the National Association of Automobile Manufacturers will not be permitted to exhibit at the Chicago show, which is given by that association.

A further drawback, in the eyes of some of those who have been solicited to take space at the proposed Palace show, exists in the fact that their exhibits, if brought to the Palace, would be within the boundaries of the Federal court district where the Selden patent was sustained. The attachments and injunction proceedings which would be possible should the Licensed attorneys get "busy," it is thought might prove an unpleasant obligato to the "independent" show itself.

**THE WEEK'S INCORPORATIONS.**

Fort Worth, Tex.—Imperial Garage & Sales Co., under Texas laws with \$10,000 capital.

Freehold, N. J.—Ocean Garage Co., under New Jersey laws with \$10,000 capital; general automobile business.

Akron, O.—Portage Motor Car Co., under Ohio laws with \$5,000 capital. Corporators—Albert Buehrle and others.

Cincinnati, O.—Heilman Motor Car Co., under Ohio laws with \$100,000 capital. Corporators—John C. Heilman and others.

Chicago Ill.—Henry Motor Car Co. of Illinois, under Illinois laws; general automobile business. Corporators—J. J. Maloney and others.

Independence, Mo.—Smith-White Garage Co., under Missouri laws with \$2,000 capital. Corporators—Clifford R. and J. C. Smith, and Alma R. White.

Salt Lake City, Utah.—Utah Auto Tire Repair Co., under Utah laws with \$10,000 capital. Corporators—W. C. Ewing, A. S. Wright, L. E. Higgins.

Bend, Ore.—Central Oregon Automobile Co., under Oregon laws with \$5,000 capital. Corporators—John H. Wenandy, Frank L. Bunten, Guy B. Walker.

San Antonio, Tex.—Overland Automobile Co., of San Antonio, under Texas laws with \$10,000 capital. Corporators—R. W. and A. A. Aiken, W. P. Frantz.

Stamford, Conn.—Motor Accessories Co., under Connecticut laws with \$5,000 capital. Corporators—J. A. Mechaley, Arthur McMullen, Jr., R. G. Lockwood.

Frankfort, Ky.—Capital Motor Co., under Kentucky laws with \$3,000 capital. Corporators—W. L. and Pearl Williams, Joseph and Margaret Severance.

Dover, Del.—Automobile Co. of Philadelphia, under Delaware laws with \$50,000 capital. Corporators—J. H. Hughes, J. L. Wolcott, E. A. Bice, all of Dover.

Portland, N. Dakota.—Portland Automobile Co., under North Dakota laws with \$50,000 capital. Corporators—B. B. Grinley, Osten Thykeson, G. K. Jordet.

Fulton, N. Y.—Fulton Motor Co., under New York laws with \$10,000 capital; general automobile business. Corporators—Alfred N. Seymore, M. S. Powell, John C. Larkin.

Boston, Mass.—Union Fuel Co., under Massachusetts laws, with \$200,000 capital; to deal in fuels of all kinds. Corporators—C. H. Woodbury, Boston; T. S. McGowan, Brookline.

Cincinnati, O.—James Kidney Motor Truck Co., under Ohio laws with \$10,000 capital. Corporators—James P. Kidney, W. W. Ramsey, W. A. Stuart, E. E. Clark, Joseph Wilshire.

Louisville, Ky.—Falls City Vulcanizing Co., under Kentucky laws with \$5,000 capital; to manufacture automobiles, bicycles and supplies. Corporators—Albert H.

Drake, Joseph C. Kirchdorfer, Herman Jansen.

New Rochelle, N. Y.—Morgan-Swan Taxicab Co., under New York laws, with \$10,000 capital. Corporators—William W. Swan, Charles H. Morgan and Albert B. Morgan, all of New Rochelle.

Detroit, Mich.—Stuart Commercial Car Co., under Michigan laws with \$300,000 capital. Corporators—William W., Alexander F. Walker, Michael B. O'Connor, Johnson and Walter E. Stuart.

Detroit, Mich.—Commercial Motor Car Co., under Michigan laws with \$30,000 capital. Corporators—Charles Goodrich, Charles Flowers, George D. Wandless, H. Y. McMullen, L. B. Goodrich.

Richmond, Va.—Richmond Motor Car Co., under Virginia laws with \$5,000 to \$15,000 capital; to operate a garage and transfer business. Corporators—S. W. Meek, C. L. Atkins, M. L. Lloyd.

Washington, D. C.—Universal Motor Co., under Delaware laws with \$5,000,000 capital. Corporators—George G. Schroeder, Washington; Charles G. Guyer, S. E. Becker, Wilmington, Del.

St. Paul, Minn.—Joerns-Thiem Motor Car Co., under Minnesota laws with \$200,000 capital; to manufacture pleasure and commercial motor cars. Corporators—Fred Joerns, E. A. Thiem and others.

Petersburg, Va.—Percivall Motor Corporation, under Virginia laws with \$1,000 to \$50,000 capital; general automobile business. Corporators—H. L. Percivall, Benjamin Harrison, G. W. Watson, J. S. Gresham.

Omaha, Neb.—Independent Auto Repair Co., under Nebraska laws with \$25,000 capital; to manufacture automobiles, engines, etc. Corporators—Henry J. and Mary A. Galarneau, Ezra P. Beechler, Thaddeus E. Smith.

Shirley, Ind.—Woodburn Automobile Co., under Indiana laws with \$50,000 capital; to manufacture automobiles. Corporators—George Stenger, W. F. Keller, Herman, W. F. and E. F. Messman, E. P. Keller, Adolph Redderson.

Detroit, Mich.—Miller-Sprague-Waldo Mfg. Co., under Michigan laws with \$25,000 capital; to manufacture automobile accessories, etc. Corporators—Lewis C., John R. Waldo, George Miller, H. B. Ransom, Edwin W. Sprague.

Buffalo, N. Y.—Willet Engine & Carbu-  
retter Co., under New York laws with \$1,000,000 capital; to manufacture gasoline engines and vehicles. Corporators—Isidore Michael, Edward Michael, J. D. Willet, William G. Colwell, Albert F. Brown.

Newark, N. J.—Times Square Automobile Co., under New Jersey laws with \$125,000 capital; to manufacture and deal in automobiles, etc. Corporators—O. L. Weingarten, M. Froelich, Chicago, Ill.; L. Weingarten, Newark; L. Mansbach, New York City.

New Rochelle, N. Y.—New York & New

Rochelle Automobile Co., under New York laws; to maintain and conduct garages, etc.; to deal in and repair automobiles, accessories, etc. Corporators—Milford Simis, Leon Kaufman, New York City; Edward L. Walter, New Rochelle.

**Warner's New Company Begins Building.**

The Muncie Gear Works, which recently was organized in the Indiana city of that name, has been incorporated under the laws of the Hoosier state with \$250,000 capital. The directors named are H. L. Warner, B. O. Skillen, G. H. Guthrie, Joseph McPherson and F. F. McClellan. They already have acquired a tract of 2¼ acres on which three sets of concrete buildings will be erected. The main structure will be 175x280 feet. Preliminary work already has been started and it is expected that the plant will be ready for occupancy some time during the month of June. The company will manufacture automobile parts, most of them designed by H. L. Warner, who has been engaged in the parts business for several years.

**Baker Forms New Drop Forge Company.**

The Baker Drop Forge Co. has been formed in Jackson, Mich., chiefly for the production of forgings for the automobile trade; it is capitalized at \$65,000, and a site has been purchased adjoining the factory of the Frost Gear & Machine Co., the stockholders of which largely make up the new concern, of which W. H. Baker, former manager of the Jackson Drop Forge Co., is president. The other officers are: Vice-president, M. C. Townley; secretary and treasurer, C. M. Frost; directors, W. H. Baker, M. C. Townley, E. J. Weeks, A. S. Glasgow, E. T. Frost, C. M. Frost, E. C. Weeks. It is expected that the new concrete plant will be operating in 90 days.

**Joerns-Thiem Acquires a Factory.**

The Joerns-Thiem Motor Car Co. has been organized in St. Paul, Minn., and is installing machinery in the factory formerly occupied by the Brace Furniture Co., at Hampden and Hersey avenues, St. Anthony Park. The concern is incorporated with \$200,000 capital and is financed by Twin City money. Fred Joerns, of the Joerns Bros. Mfg. Co., St. Paul, is president, and E. A. Thiem, a motorcycle manufacturer of Minneapolis, is secretary. An experimental commercial car of 36 horsepower and 1½ tons capacity, has been built at Thiem's motorcycle plant, but it is the intention to make both pleasure cars and commercials.

**To Make Tire Chains in Brooklyn.**

To establish a factory for the manufacture of non-skid chains for motor cars, the Atlas Chain Co. has taken 10,000 square feet in Model Loft No. 4 of the Bush Terminal buildings, at the foot of Thirty-fifth street, Brooklyn, N. Y. About 100 operatives are to be employed.

## IN THE RETAIL WORLD.

Charles Fenn, Antigo, Wis., is preparing to open a garage; it will include a repair department.

Walter Sanders, Riverside, Cal., has erected a garage and equipped it with facilities for repairing.

The Kansas City (Mo.) Regal Co., which dispenses Regal cars locally, has taken new quarters at 1524 Grand avenue.

L. K. Cowley, Wichita, Kan., has taken temporary quarters at 154 North Emporia street. He handles the Cadillac.

Holmquist Bros., Centerville, S. Dakota, have embarked in the garage business in that town. They will feature repairing.

The Baach-Reed-Gage Garage Co. is the elongated title of a new concern which has opened up at Janesville, Wis. It will specialize on repair work.

The Housman-Blake Automobile Co., St. Louis, Mo., has taken over the new garage building at 5037 Delmar boulevard. It will handle the Springfield car.

St. Louis, Mo., has a new addition to its motor colony in the Lindell Motor Car Co., which has located at 2800 Olive street. The Enger car will be exploited.

John N. Easland Great Barrington, Mass., soon will place in commission his new garage in the Crotty & Viola block. It will be devoted largely to storage purposes.

The Foster Electric Co., Marinette, Wis., has commenced business in that place. It will confine its efforts to the sale and repair of electric vehicles exclusively.

Formed to market Krit cars in the Flour City, the Krit Automobile Co. has opened salesrooms at 1027 Hennepin avenue, Minneapolis, Minn. J. E. Doherty will be the manager.

The St. Louis (Mo.) Overland Co. will soon remove to new quarters at 3907-11 Olive street. The premises at present are occupied by the Fisk Rubber Co., which is about to vacate them.

R. M. Randal, Dallas, Tex., local representative of the Republic Rubber Co., has established permanent quarters at 319 Commerce street. A full line of Republic products will be stocked.

Ashley D. Scott and Charles Sonneman, St. Louis, Mo., have taken showrooms at 3432 Lindell avenue, where they will handle the R. A. C. car. The former is one of the pioneers of the local trade.

Work has been begun on a brick structure on the Scott estate, 915 Main street, Little Rock, Ark., which when completed, will be occupied by S. R. Thomas as an automobile sales and garage building.

Broadway, New York's "automobile row," has another new motor car establishment in the H. & H. Sales Co., which has taken up quarters at No. 2100, corner Seventythird street. It will market the Demot car.

The Fitchburg (Mass.) Cab & Automobile

Co. has taken a five years lease of the large stable on Grove street, near Elm, and shortly will open an automobile livery. Packard cars, both open and enclosed, will be employed.

Backed by prominent Dallas business men, the Imperial Garage & Sales Co., has entered the trade at Fort Worth, Tex., and has leased the premises at 493 Commerce street. The Stearns and other lines will be exploited.

The Du Puy Motor Car Co. Dallas, Tex., is the title of a new concern just formed in that city. C. L. Du Puy, a well known local tradesman, and George P. McAtee, a Houston capitalist, who comprise the firm, will represent the Selden.

The Henry Motor Car Co. of Illinois has been formed, with showrooms at 1549 Michigan avenue, Chicago, and will act as distributor for the Henry car in Illinois, Iowa, Wisconsin and Indiana. E. C. Haynes will be manager of the concern.

The Cook & Stoddard Co., Washington, D. C., is the proud possessor of new and handsome salesrooms, just opened at 1313 H street, N. W. The service department will remain at the old location, Twenty-second and P streets, N. W.

Lea, McKallipp & Abbey, Houston, Tex., formerly located at 608 Travis street, have changed their address and now may be found at 714 Main street. They handle the Jackson, Fuller, Glide and Babcock electric, and do a renting business also.

Work is progressing rapidly on the new reinforced concrete garage which is being erected for the Brownlee Automobile Co., San Antonio, Tex., at San Pedro avenue and Evergreen street. It will be two stories, 56 by 83 feet, and will cost \$15,000.

E. A. Garlock, Washington, D. C., has purchased the Overland Sales Co. located at 1214 V street, N. W. He shortly will remove the establishment to new quarters at 1521 14th street, N. W., where it will be conducted as the Overland Garage.

The Auto & Motor Boat Co., Houston, Tex., entered its new quarters at Capitol avenue and Milam street, last week. The firm is housed in a two story building 80 by 90 feet, completely equipped, where Moon and Franklin cars will be distributed.

The Iowa Auto & Tire Co., Davenport, has established a branch in Cedar Rapids, with a floor space 60 by 140 feet. The offspring will, of course, carry the same lines as the parent company—namely, Pierce-Arrow, Thomas Cadillac and Babcock electric.

The Fulton (N. Y.) Motor Car Co. has taken out its "papers" and commenced business at 64 South First street, where it will conduct a general garage business. The moving spirits in the enterprise are Alfred N. Seymore, M. S. Powell and John C. Larkin.

The White Star Taxicab & Garage Co., Chicago, Ill., which was formed recently, is

having a garage erected on Fortieth street, near Drexel boulevard. The new building, which will cover the entire tract, will be two stories high, 48 by 165 feet, and will cost \$15,000.

The Utah Auto Tire Repair Co., Salt Lake City, is a new enterprise just formed to take over and operate the tire repairing establishment located at 125 East Second South street. Among those interested in the concern are W. C. Ewing, A. S. Wright and L. E. Higgins.

L. D. Ward, Lexington, Ky., who has operated a garage on West Main street under the style of the Blue Grass Auto Co., has sold his business to C. W. Howard and W. D. McIntire, of Millersburg. The new proprietors will conduct the business along the lines heretofore pursued.

Taking its name from the thoroughfare on which it is located, the Jefferson Garage & Automobile Repair Co., Hartford, Conn., has "opened up" at 10 Jefferson street. The members of the firm, R. J. Dalton, Ambrose Upson and Burton Fox, are all former employees of the local motor car factories.

What will be one of the best appointed sales and service buildings in the West will be erected for the Ford Motor Co., at Twentieth and Harney streets, Omaha, Neb. Occupying an entire corner lot, the structure will be two stories, 60x137, and will cost \$38,000. Glass will be used extensively in its construction to insure ample lighting facilities.

One of the finest automobile salesrooms in the state just has been completed for the Maxwell-Briscoe-Indianapolis Co., at Illinois and Vermont streets, Indianapolis, Ind., to occupy which the concern has vacated its old quarters on Massachusetts avenue. The new place is a three story structure and is completely equipped for the distribution, storage and repairing of Maxwell cars.

Minneapolis, Minn., has received an addition to its automobile colony through the formation of the Northwestern Overland Co., with headquarters at 921 Hennepin avenue. The new concern, which was launched by W. J. Bowman and R. A. Creek, two veteran tradesmen, will act as wholesale distributors for Overland cars in Minnesota, Montana, Wisconsin, the Dakotas and Western Canada.

The Buck Auto Co., 612-614 Mulberry street, Des Moines, Ia., has been purchased by Leslie T. Tietje, formerly connected with the Riddell Auto Co., and several other local garage men who pooled their interests to consummate the deal. The new owners will operate under a new name, and the former proprietors will establish a new garage on Walnut street, between Tenth and Eleventh, where the Packard will be handled exclusively. The Walnut street venture will be operated under the name of the Buck Auto Co., which is controlled by Davenport interests.

# The easiest-riding Car in the World

IS THE

# WHITE STEAM CAR

The White Steam Car has many desirable qualities which are not equalled in any other type of car. At all times and under all conditions it is noiseless, absolutely free from vibration, smokeless and odorless. It is easiest on tires. It has unequalled hill-climbing ability. The engine can never be "stalled." It is by far the easiest car to control and it is, therefore, the safest car for passengers as well as for other users of the highway. Either kerosene or gasoline may be used as fuel.

The development of the White Steam Car—the perfection of details, simplification of parts, etc.—has gone on steadily from year to year. As a result, the 1910 White Steamer represents as great an advance over the steam car of a few years ago, as does the 1910 White Gasoline Car compared with gasoline cars designed several years ago.

During the last nine months—from July 1st to date—more White Steamers have been made and delivered to customers than in the corresponding period of any previous year.

---

Are you familiar with the many desirable features of the 1910 White Steam Car? A postal to us brings a copy of our catalog.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, APRIL 14, 1910.

### The "Marooning" of New Jersey.

New York finally having inserted a reciprocity clause in its pending automobile bill, it looks as if nothing can prevent the "marooning" of New Jersey and as if its more or less victimized citizens will at last be brought to realize the full price of Frelinghuysenism. That possibly illustrious Senator is about to be hoist by his own petard. It may have been a bright idea to build a fence around the state and force all who would enter to pay an admission fee, but with the states surrounding New Jersey each erecting a fence of its own and exacting even higher admission fees from the Jerseymen, any brightness the idea may have possessed will be so dimmed that few of those affected will be able to see it.

The policy of states treating the citizens of other states as foreigners and the spirit of retaliation which it has aroused are not wholesome. The regret that will go out to the residents of New Jersey will be tem-

pered somewhat by the knowledge that the author of this policy will feel the full force of the New York law when it is enacted. There are reasons for believing that Mr. Frelinghuysen is not over-anxious to pay admission fees and that he will not enjoy the taste of his own medicine which is in preparation.

### Psychology Applied to Motorists.

The proposal of Professor Charles Sherwood Ricker, of the Department of Psychology at Harvard University, to eliminate by experimental psychology the driver unfit to be trusted with the operation of a motor car, may be, and probably is, extremely interesting and valuable to the medical profession, but as a practical and real solution of the problem it is of little advantage to the everyday motorist. While it may be admitted, as Professor Ricker says, that the main difficulty with the majority of chauffeurs lies in their inability to react quickly upon perceptions and impressions, it must be remembered, nevertheless, that the conditions of the tests advocated are so artificial that they form no real criterion as to the abilities of the person under test to react swiftly upon real danger signals, and under actual existing street conditions; and furthermore, that they furnish no criterion as to the mental qualities tending to recklessness—the admitted cause of most accidents.

Humanity is composed of an almost infinite variety of characters; the slow and pedantically inclined are jostled about just as much as the naturally restive and nervous; they have to cross the crowded streets, dodge vehicles and make certain decisions quickly, whether they drive automobiles or not, and most of them pass these tests unscathed. The automobile has become an absolute necessity in the development of human activity, and as such it must continue; and the person of sluggish nerve action will continue to drive a car, because such apparent sluggishness cannot be regarded a certain symptom of inefficiency. Psychology, both experimental and deductive, has rendered many services to the human race, but its principles as yet are far from being viewed with conviction as applied to the affairs of the working-world.

The speed of mental reaction must increase with the familiarity of the subject. The man undergoing a test of the kind advocated by the Harvard professor may be extremely slow at the time such a test is

taking place, and yet prove himself sufficiently quick in real action when he has become familiar with the symptoms of danger and the driving, braking and steering movements, so that he acts almost subconsciously. Again, a subject undergoing a good test at one time, at another might fail to pass the requirement.

Such an apparatus as has been developed for purely psychological research might, however, be put to good use as a quick means of applying the simple tests as to facility in handling the control mechanism of the average car. Standard requirements based upon such tests might be employed profitably by state license examiners in weeding out novice drivers who are unfamiliar with the ordinary requirements of car manipulation. But such a test never should be drawn very closely nor considered final. The real measure of ability to operate a car successfully under trying conditions is the road tryout under real, not imaginary, conditions.

### Attempts to Eliminate "Globules."

That there is much yet to be learned about the carburetter problem, nobody will undertake to deny. But exactly what is the nature of the knowledge that is lacking few even of the best informed and most proficient engineers are able to agree upon. It is this very uncertainty which lends interest to the problem, especially in the case of those who otherwise might be inclined to pass over it so long as some device of the sort could be made or bought which would serve a normal engine with a usable quality of gas under ordinary road conditions. Although the internal combustion engine is pretty well understood at the present time, and although carburetters, as they are now known, exhibit certain familiar characteristics, the fact remains that the problem, as such, remains in a state of beautiful and nebulous theory and subject to a bewildering variety of interpretations.

Such being the case, it is not surprising to learn that one manufacturer, having decided, for reasons best known to himself, to provide a water jacket over the intake manifold, was greatly pleased, if not a little astonished, to discover therefrom a resulting gain of four actual horsepower, representing the equivalent of 8 per cent, over the original output on the bench. Indeed, the gain achieved in this and other ways was so much greater than had been anticipated that it was not without its embarrassments in

certain respects. Other makers have adopted the same plan with good results, though the actual ratio of gain in this or other instances is not important just here; the point is that merely preventing the temperature of the gas from being lowered in its passage from the mixing chamber to the cylinders, and while retarded evaporation was in progress, frequently serves to liven up the engine and also to improve its fuel consumption.

This leads to the "globular" theory, which is a favorite topic of discussion with carburetter theorists at the present time, and which also may be considered of some use in mystifying new recruits to the motoring ranks. The theory is that the action of the ordinary jet is to split the gasoline up into a multitude of tiny globules, each of which, in its progress toward the cylinders, soon becomes surrounded by a little atmosphere of its own which is composed of pure gasoline vapor. If the vapor which is composed of such globules is permitted to flow without much interference, the surrounding body of warm air aids in evaporating the liquid core—the "pulp," as one expert would have it—at the same time thickening the outer skin of vapor which surrounds the infinitesimal orange.

Obviously anything tending to break up the globules, increase the rate of evaporation, or free the main body of gas of the lumpy character which it assumes as a result of the globular tendency is in the direction of progress, and makes for improved running conditions, as well as for improved economy of operation. Jacketing the manifold is one way of going about it; churning the gas with a miniature fan is another, still other methods readily may be conceived.

One disconcerting fact in connection with the admittedly satisfactory performance of the modern high-grade carburetter is that fuel injection motors have been constructed and run under load on what is figuratively speaking, only a "smell" of gasoline, as compared with the consumption of the average external vaporizing and mixing device. Nor is the phenomenon of successful running on what ordinarily would be known as a weak mixture—too weak to run on in fact—confined to a single type of motor of the general class in question. It is, or seems to be, a characteristic which arises from the method of handling the gas, and may be regarded as a useful and suggestive commentary on the shortcomings of even

the most successful carburetter of the present day.

When a man takes another man's letter and, even for private circulation, changes its language to suit his own purposes, he is guilty of what is expressively if inelegantly termed "dirty business." When, with studied and malicious intention, a letter so distorted is published by such a man in a public print, "dirty business" is a term too polite fitly to describe the offense. We charitably had supposed that W. J. Morgan had put his interesting past so far behind him that he had forgotten his old wiles and devices, but apparently we were mistaken, for he has been guilty of an offense of the sort. Although but a few days before he was belittling Barney Oldfield in print, he nevertheless took Oldfield's bombastic and rather amusing "fling" at the Motor World, and after distorting it in such a manner as to render the paper printing it clearly liable at law from two sides, Morgan gave space to it in the New York publication which is generous enough to permit him to promote his own private ventures, on which it has been the pleasure of the Motor World to turn some light. If the publication in question will stand for such offenses, it will stand for almost anything; but it seems to possess so much character that it is doubtful if its responsible heads are aware of the gross misuse made of its columns.

Following the lead of the Motor World in drawing attention to the clause in the pending New York bill, which would have legislated out of use a number of non-skid tires—which clause since has been eliminated—the New Jersey deputy who acts as "auto editor" of the New York Globe has succeeded in working himself into a high fever over the matter. Among other things, he chides the tire manufacturers for remaining ignorant of such affairs that directly affect their own interests and expresses wonder that even E. S. Cornell, secretary of the National Society of Henry Clews, did nothing to prevent the threatened legislation. But if the New Jersey deputy was as well informed as he should be, he would have known that not all of the tire manufacturers were as ignorant or as disinterested as he fancies is the case. Even Mr. Cornell, who, after the Motor World took the initiative, suddenly became almost as excited as the New Jerseyman, could have told him that much.

## COMING EVENTS

April 11-18, Springfield, Mo.—Springfield Chamber of Commerce's first automobile show.

April 18-23, Bangor, Me.—Second annual automobile show in Auditorium.

April 30, Philadelphia, Pa.—Quaker City Motor Club's third annual roadability run to Atlantic City.

April 30, Kansas City, Mo.—Automobile Club of Kansas City's hill-climb on Dodson hill.

May 2, Denver, Colo.—Start of Flag-to-Flag endurance and reliability contest to City of Mexico for Wahlgreen trophy.

May 3, Trenton, N. J.—Trenton Automobile Dealers' second annual 300 miles endurance run.

May 5-7, Richmond, Va.—Richmond Times-Despatch endurance run.

May 5-7, Atlanta, Ga.—Opening spring race meeting on Atlanta motordrome.

May 9-11, Harrisburg, Pa.—Motor Club of Harrisburg's fourth annual reliability contest.

May 10-11, New York City—Motor Contest Association's reliability contest to Atlantic City and return.

May 13-14, New York City—Motor Racing Association's 24 hours race at Brighton Beach track.

May 18-19, Norristown, Pa.—Norristown Automobile Club's third annual endurance run to Scranton and return.

May 19-21, Hartford, Conn.—Automobile Club of Hartford's All-Connecticut reliability contest; 600 miles.

May 21-22, Brooklyn, N. Y.—Crescent Athletic Club-Long Island Automobile Club amateur touring contest on Long Island for Pardington trophy.

May 28, White Plains, N. Y.—Amateur Automobile Contest Association's hillclimb.

May 27, 28 and 30, Indianapolis, Ind.—Grand Circuit meeting and national championship races on Motor Speedway.

May 30, Briarcliff Manor, N. Y.—Amateur Automobile Contest Association's hillclimb.

May 30, Bridgeport, Conn.—Automobile Club of Bridgeport's fifth annual hillclimb on Sport Hill, Easton.

June 4, Worcester, Mass.—Automobile Club of Worcester's annual hillclimb on Dead Horse hill.

May 30, Denver, Colo.—Denver Motor Club's annual road race.

June 1, Berlin, Germany.—Start of Prince Henry tour, finishing at Homburg on 8th.

June 11, Wilkes-Barre, Pa.—Wilkes-Barre Automobile Club's annual hill climb or Giant's Despair.

## A. L. A. M. DINNER A HAPPY AFFAIR

**Toastmaster's Audacious Address Starts the Merriment and the Lighter View Prevails—Loving Cup and Piano for the Cliftons.**

To give a hint for a "keynote," if the latter were required, there appeared on the inside front cover of the menu of the "Annual Dinner of the Association of Licensed Automobile Manufacturers, Hotel Astor, New York, Thursday, April seventh," a quotation from Job E. Hedges, as follows:

"The Country is safe when competitors in business can eat together without eating each other."

As a tuning fork, the quotation apparently was entirely successful, and as Hedges himself presided as toastmaster, the affair was assisted by such spontaneous supplements as he chose to lend to the epigram. The gathering also boasted a real governor, as an aid to its eclat, but its chief climax was reached in the presentation of a loving cup to Charles Clifton, president of the Association—although it is probable that Arthur Brisbane takes issue with this view and still regards his number as the more important.

There have been "annual" dinners of the Licensed Association before, but in few respects did they resemble this one, which in addition to being highly formal in character was attended by an imposing list of makers who only a year ago were leaders in the unlicensed ranks and were not either invited or disposed to attend such a purely Licensed function. The dinner served to "bring them together" and to create a social agglomeration of all the present licensees under the Selden patent, which may induce further unity in the Association's business structure.

When the offerings of the Hotel Astor chefs had sufficiently advanced in their courses, Toastmaster Hedges started the speechmaking. After exhorting the diners to look to "better things above" (the ladies being in the balcony), he bewailed the fact that happy and pleasurable as the dinner might seem to some, it nevertheless gave him the impression of a funeral—a funeral at which he was undertaker, chief mourner and the corpse, because the affair marked the burial of the American Motor Car Manufacturers Association, of which he had been the adviser and counsel.

Pathetically he pointed to the lonely situation in which he found himself when the independent organization was no more; and how even his modest stipend was cut off, while the Licensed Association not only took Alfred Reeves, but raised Reeves's salary to enormous heights. A rescuer for Hedges had come, however, in the person of Henry Ford, who had seen to it that he was provided for by making him a Ford

legal adviser. For this reason, Hedges explained, he felt impelled to wax enthusiastic over Ford's generous and hospitable qualities, and would even go so far as to welcome the guests in Henry Ford's name, declaring that Ford himself would have ex-

CHARLES CLIFTON

HIS LOVING CUP

tended such a welcome had he been there.

Hedges's bold and humorous introduction of Ford's name caused some gasps of astonishment at first, but met with a riotously appreciative reception. His whole speech created a mood which made things easy for the speakers whom he subsequently introduced. The latter, together with guests of honor, sat at his right and left at a long table placed on one side of the Laurel Room, in which the dinner was given, while the main body of the diners were grouped at smaller, circular tables. The list of

those at the guests table, in addition to the toastmaster, included: Charles Clifton, William H. Edwards, Hon. Fred M. Warner, Thomas Henderson, Samuel T. Davis, Jr., Colonel George Pope, Arthur Brisbane, Herbert Lloyd, Hugh Chalmers, Lewis H. Kittredge, George B. Selden, Howard E. Raymond, Harry A. Lozier, Benjamin Briscoe, Ransom E. Olds, Albert L. Pope.

As the chief executive of the most productive automobile state in the Union, Governor Fred M. Warner, of Michigan, naturally enough was impelled to discourse glowingly on the number and aggregate value of the automobiles built in Michigan factories, after which he struck out more broadly and expressed a confidence in an ultimate good road movement by which the Federal government would assist the states, and the states assist the counties, in the building of highways that will be a credit and benefit to the nation.

Next on the list was Arthur Brisbane, who instead of being a speaker in the banquet sense, turned out to be more of a lecturer and didactic oracle. He lectured the makers thoroughly on what they should and should not do, incidentally explaining to them that he knew considerably more about some aspects of their business than they themselves, particularly as to the advertising. There was no little lifting of eyebrows in polite question when he predicted positively that high priced cars would soon be a "curiosity" because of their almost complete extinction. His claim that practically every man who can afford to buy a car and wants one is already supplied or has his order in, served to introduce a suggestion that hereafter the makers turn their attention to making customers of the 100,000 women in the United States to whom cars could be sold if the right selling effort were directed toward getting their orders, or who could persuade "tight wad" husbands to "give up." Another proposal that he advanced was for the makers to get together and build 100,000 satisfactory low price machines of the convertible type, so that the plumber, the baker and the middle class merchant could use the car for utilitarian purposes during the week and for pleasure purposes for himself and family on Sunday. With prophetic eye he looked forward to vacuum cleaning for city streets, and he maintained that the police should not interfere with chauffeurs whose cars "smoke" from too much oil, but that the offending drivers should be left to suffer the ridicule of their more skilled confreres who would make them regard "smoking" as a sign of inferior driving technique.

A few shafts directed at Joseph "Evergreen" Ryan, of Chicago, in the course of Brisbane's remarks, brought Ryan to his feet for reply, in much the same way that the two have performed elsewhere on the banquet circuit in giving their "repartee duo" act. Ryan's comedy work was well received.

"Big Bill" Edwards, the street cleaning

ANNUAL DINNER OF THE ASSOCIATION OF LICENSED AUTOMOBILE MANUFACTURERS AT HOTEL  
ASTOR, NEW YORK, APRIL 7TH.

Reading from left to right, those seated at the guests' table are: Albert L. Pope, president Pope Mfg. Co.; Benjamin Briscoe, president United States Motor Co.; Howard E. Raymond, president Motor and Accessory Manufacturers; Hugh Chalmers, president Chalmers Motor Co.; Arthur Brisbane, Editor New York Journal; Samuel T. Davis, Jr., vice-president A. L. A. M.; Hon. Fred M. Warner, Governor of Michigan; Col. Charles Clifton, president A. L. A. M.; Job E. Hedges, Toastmaster; William H. Edwards, Commissioner of Street Cleaning, New York City; Thomas Henderson, vice-president Winton Motor Carriage Co.; Col. George Pope, treasurer A. L. A. M.; Herbert Lloyd, president Columbia Motor Car Co.; Lewis H. Kittredge, secretary A. L. A. M.; Harry A. Lozier, president Lozier Motor Co.; Ransom E. Olds, president Reo Motor Car Co.

The real sentiment of the evening developed when Colonel George Pope, on be-

In winding up the evening, Toastmaster Hedges took the ladies into his confidence and told them that the official ceremonies.

## Bay Staters May "Beat" Taxis.

It was probably on this account that a New Yorker the other day hired a taxicab in Manhattan for a trip to Boston. When Waltham was reached the passenger took "French leave," without saying anything about the payment of the \$171.40, which the taximeter registered. The chauffeur who has the distinction of having driven a "fare" the longest distance without compensation heretofore recorded, and his long-distance cab, were shipped back to New York by boat.

While some doctors, and a good many people who are not doctors, have been blaming the motor car for many of the ills that modern man is heir to, Dr. James Tyson, of the University of Pennsylvania, praises the automobile for its services to medicine and hygiene. "One of the best forms of exercising," he said, "which will tend to strengthen the heart perhaps quicker than anything else, is automobiling. This, of course, is true, provided that the patient is not timid or of extremely nervous temperament. In automobiling considerable fresh air is forced into the lungs, and in this way the heart is greatly stimulated without undue exertion."

Claiming that the schedule of the post office compelled him to break the speed laws when collecting mail from the boxes, Earl Miller, a chauffeur in charge of an Indianapolis mail collecting wagon was discharged by the court, while the officers responsible for making up the schedule were subpoenaed for appearance in court the next day. As a result of the court's examination of this schedule, the latter is to be revised.

### GOLDBERG'S CARTOON THAT ENLIVENED THE MENU

When President Clifton stood up to respond he was given a standing ovation, with waving napkins and hearty cheers. When finally he was given opportunity to speak he gracefully disclaimed the credit for so large a portion of the Association's success as had been ascribed to him. He indicated that whatever honors might exist were due to the members themselves, whose co-operation and assistance had made the Association's success possible. In accepting the cup for himself and the piano for Mrs. Clifton, he deprecated any tendency to give him more credit than was his due, and he asked for a continuance of the hearty co-operation of the members. indi-

Amusement managers have been convinced for some time that one of the best ways to make people enjoy themselves is to give them the opportunity of actually and actively participating in the fun, and the banquet parodies were a winning feature in this respect, as they induced many staid manufacturers to sing themselves hoarse in shouting the frivolous sentiments of the refrains. Two of the half dozen parodies which aided in stirring up the free-from-care atmosphere and promoting fellowship spirit, are as follows:

(Tune of "Afraid to Go Home in the Dark.")  
 Clifton, dear, listen here,  
 A license is what we desire.  
 We will pay  
 Our money today  
 Before the price goes any higher.  
 We've finished today  
 With the M. C. M. A.  
 Of patent strife we tire.

## NEW YORK FOR RECIPROCITY

**Reamended Callan Bill Provides for It—Progressive Penalties Eliminated and Other Important Changes Made.**

After August 1st, the state of New Jersey will be entirely "marooned." This is made practically certain by the latest revision of the Callan automobile bill, now pending in the New York legislature, which as amended last week, includes a "reciprocity clause" and thus completely isolates New Jersey, the states of Pennsylvania and Delaware already having adopted a similar requirement. As the Mosquito State failed to waive the "admission fee," which it so long has exacted from non-residents, New Jersey motorists will be compelled to annually disgorge from \$5 to \$25, according to the horsepower of their cars, for the right or privilege to use the roads of New York.

This latest overhauling of the Callan bill was the result of another hearing and another long conference between the legislative leaders, which took place late last week.

In its chief features, the bill, which has been restored to the order of third reading, remains the same as printed in full in the *Motor World* of March 31st. Except in respect to vehicles used solely for commercial purposes, the registration fee for which was increased from \$2 to \$5 per year, the fees, \$5 to \$25, and the speed limit 30 miles per hour, remain unchanged. One of the amendments, however, permits purchasers of cars to operate under the dealers' registration numbers for 15 days or until they have obtained their own certificates.

Cities of the first class, which means New York and Buffalo, still are permitted to fix their own speed limits and traffic regulations, but a new provision requires that they enact such general ordinances before the Callan bill—if it is enacted—becomes effective on August 1st next. Other cities and incorporated villages may adopt speed limits not more restrictive than 15 miles per hour, but another added requirement compels that official copies of all local ordinances be filed with the Secretary of State at least 30 days before they take effect.

Apart from the reciprocity clause, possibly the most important and unexpected change effected last week, was the elimination of progressive penalties for violation of the speed limits. The present law provides increased fines and imprisonment for second, third and subsequent offenses and these were continued in the previous drafts of the Callan bill. In the reamending of it they were wiped out and speed offenses are made "a misdemeanor punishable by a fine not exceeding \$100." Imprisonment and indictment will be no longer possible. Chauff-

feurs—who are defined as persons operating cars "as employees or for hire," which would seem to include salesmen and possibly branch managers as well as professional drivers—may have their licenses revoked for third or subsequent offenses, and owners and chauffeurs alike will have their registration and license certificates, respectively, revoked for intoxication or for not stopping in case of accident, the latter offense constituting a felony. But a new sentence which has been inserted makes such suspension or revocation conditional on the recommendation of the trial court, thus wisely giving the technical offender a chance for the mercy that goes with real justice.

The so-called "joy riding" clause—the one fixing a fine and imprisonment for using, injuring or tampering with a car without the owner's permission—also has been eliminated. This probably was done because of the existence of a separate law covering the offense.

The full text of the new reciprocity clause is as follows:

285. Exemption of non-resident owners. The provisions of the fore-going sections relative to registration and display of registration numbers shall not apply to a motor vehicle owned by a non-resident of this state, other than a foreign corporation doing business in this state, provided that the owner thereof shall have complied with the provisions of the law of the state, territory or federal district of his residence relative to registration of motor vehicles and the display of registration numbers thereon, and shall conspicuously display his registration numbers as required thereby. The provisions of this section, however, shall be operative as to a motor vehicle owned by a non-resident of this state only to the extent that under the laws of the state, territory or federal district of his residence like exemptions and privileges are granted to motor vehicles duly registered under the laws of and owned by residents of this state.

### Glidden Pathfinder Now on Its Way.

Escorted by a cavalcade of 50 cars, the Chalmers "30," driven by Joseph W. Gardham, the 1910 official pathfinder, carrying Dai H. Lewis, of Buffalo, the veteran scout, who will lay out the route, L. J. Smith, Detroit, and N. Lazarnick, photographer, left Cincinnati, O., on Tuesday, 12th inst., and crossing the Ohio River to the Blue Grass state, started on its long and trying 2,500 miles journey. The first day's run was to Lexington, Ky., 83 miles, and the roads were found in excellent shape. In order that Lewis may have every assistance in logging the route, the data gathered by Frank Zirbes in the Mitchell Ranger, which recently completed a trip over the course, arrangements have been made to turn this valuable information over to Lewis. The Mitchell expedition encountered very bad weather and roads, and Zirbes voices the opinion that there will be no clean scores in this year's reliability contest. It is expected that the pathfinders will require at least six weeks to map out the route of the tour.

## TWO DAYS OF EASY ENDURANCE

**Savannah Club Promotes It and Nearly All Survive with "Perfect Scores," a Lady Among Them.**

Notable in the fact that all of the contestants came through, the two days endurance run from Savannah, Ga., to Jacksonville, Fla., a distance of 175 miles, held on the 4th and 5th inst. by the Savannah Automobile Club, attracted 22 entries, all of whom survived the contest, 17 with perfect scores. Although the daily runs were comparatively short, 76 miles the first, and 99 the second, the roads were in bad shape in several places and many minor difficulties were encountered, which were responsible for the penalizations. One of the features of the contest was the presence of a lady, and a gentleman of the cloth among the contestants—Mrs. L. W. Hazard, and Rev. Francis Brown—both of whom drove Maxwells and finished in the perfect class.

Leaving Savannah on Monday morning, 4th inst., the cars passed through Gaston, Drayton, Darien and Midway, stopping for the night at Brunswick, which was reached about two hours behind schedule. Considerable of this tardiness was due to the delay in the ferry service at Dents Landing, while deep sand near Darien gave some of the small cars quite a tussle.

Although slightly longer, the second day's run to Jacksonville was less fatiguing, better roads being encountered, and the tourists were met at Callahan by a large party from Jacksonville who escorted the visitors to the final control. One of the most regrettable features of the contest was the enforced dropping out of the refreshment car from Jacksonville, before Callahan was reached, and as the latter is a "dry town," it well can be imagined what disappointment this mishap entailed.

Those who finished with perfect scores were the following: J. L. Highsmith, Maxwell; Chris Jacobs, Hupmobile; H. B. Flanders, Buick; L. R. Akin, Buick; Mrs. L. W. Hazard, Maxwell; W. H. Towles, Maxwell; Darwin B. Hull, Buick; Rev. Francis Brown, Maxwell; Henry A. Brantley, Maxwell; W. C. Thompson, E-M-F.; W. C. Adams, Maxwell; R. S. Brown, Cole; Robert Brockett, Maxwell; Harvey Granger, Lancia; George Mouro, Acme; N. G. Browne, Packard; A. W. Solomon, Stevens-Duryea.

### New Jersey's Non-Resident Bill Fails.

As many persons supposed was the case, the eleventh-hour motions made by the New Jersey Senate to permit non-resident motorists to enter the state without payment of a fee, were mere bluff. The Senate which previously had killed a bill of the sort that had been passed by the Assembly, permitted its own bill to die with the Legislature, which adjourned on Thursday last.

## BOARD TRACK PROVES A "HUMMER"

Los Angeles Motordrome Inaugurated with General Slaughter of Records and Spirited Sport—Honors are Well Distributed.

That the one-mile circular banked board track known as the Los Angeles Motordrome, which has been constructed at Playa del Rey, Cal., is faster than any of the specially built automobile speedways yet constructed in this country, was proven in a record-breaking manner at the inaugural meeting held on Friday, Saturday and Sunday, April 8th, 9th and 10th. Records previously established at the Indianapolis and Atlanta speedways were wiped from the slate as chaff before a gale, and although the world's one and two miles records made on the straightaway sand stretch at Florida refused to be dislodged from their perches, the times made upon the saucer track give intimation that it is not impossible that even Florida's low marks may go by the boards when the season is a bit more advanced and the drivers become more accustomed to racing upon a circular track.

It yet remains to be seen what action the Contest Board of the American Automobile Association will take in regard to classifying the performances made upon the Los Angeles track. All world's records for mile tracks were broken, and many that previously had been made at the  $2\frac{1}{2}$  miles Indianapolis and 2 miles Atlanta speedways. In classifying its records the American Automobile Association differentiates between the mile track records and the "speedway" performances. The Los Angeles mile track is at the same time a mile track and a specially constructed speedway.

What occurred at the three days' meeting last week most concisely is detailed in the following table, which shows the best times made at the various distances; where no class is specified the events were free-for-all classes in respect to piston displacement:

Distance.	Time.	Driver.	Car.
1	0:36.22	Oldfield	Benz°
2	1:18.29	Kircher	Darracq*
3	1:58.90	Robertson	Simplex*
4	2:40.76	Kircher	Darracq*
5	3:15.62	De Palma	Fiat*
5	3:15.89	Harroun	Marmon†
10	6:31.37	Robertson	Simplex*
10	9:03.25	Endicott	Cole†
10	7:49.25	Oldfield	Knox‡
15	17:07.81	De Palma	Fiat†
50	39:20.69	Marquis	Isotta‡
50	43:49.69	Endicott	Cole†
100	1:25:22.1	Harroun	Marmon‡

° Records only for Los Angeles track.

\* Records regardless of class.

† Record for cars 161-230 cubic inches.

‡ Record for cars 451-600 cubic inches.

§ Record for cars 231-300 cubic inches.

The opening day (Friday) was most productive of record breaking performances.

Oldfield covered one circuit of the track in 36.22 seconds, which, of course, is not as fast as his Florida record, nor is it as fast as Hemery's mile made at the Brooklands track in England—31.55 seconds. So far as is known, however, it is the best time for a mile made upon any track in America. Following Oldfield, Kircher made a two miles record in 1:18.29, the previous mark having stood to the credit of Strang and the Atlanta speedway in 1:21.51. DePalma then shattered the 5 miles record by covering five laps in 3:15.62. The old mark was 3:17.7, made by Louis Strang at Indianapolis December 16 last, and not 4:11.3 made by Oldfield, as stated in the dispatches. As

car came in for further glory on Sunday, when he broke the 5 miles record for cars in the 231-300 class. Harroun's time was 3:15.89, as compared to 4:48.00, as made by Strang at Indianapolis. John B. Marquis, who began his career as a motorman of a trolley car down in Pennsylvania and more recently was mecanicien for Strang, also came in for a share of the glory. Marquis cracked the 50 miles record for cars in the 451-600 cubic inches class by covering the half-century in 39:20.69, the former record having stood at 42:02.98, made by Robertson on the Atlanta course. Robertson and Kircher also established records for 3 and 4 miles, their respective times being 1:58.90

IN FULL FLIGHT ON THE NEW TRACK

soon as DePalma finished, George Robertson tried for the 10 miles record—and got it—his time being 6:31.37, which is much better than Strang's Atlanta record of 7:01.94.

One of the most notable performances of the first day's racing was the breaking of the 100 miles record for cars between 231 and 300 cubic inches piston displacement, which previously had stood to the credit of the Atlanta speedway and Harroun and his Marmon car at 1 hour 30 minutes 8.31 seconds. At the Los Angeles saucer Harroun, in a car of the same make, on Friday covered the distance in 1:25:22.1. The other record to fall on the opening day was the 10 miles mark for cars in the 161-230 cubic inches class, which Endicott reduced to 9:03.25; the former record stood at 9:43.36, made by Matson at the Atlanta track.

Although several drivers made attempts to break records in time trials on the second day's meeting, none of them were able to approach the times made the first day. The only record to fall was the 50 miles for cars in the 161-230 cubic inches class, Endicott covering the distance in 43:49.69; Matson made the old record of 50:36.00 at Atlanta last fall. Harroun and his Marmon

and 2:40.76. This comprises the record-breaking of the first three days' meeting.

Friday—April 8th.

Despite the fact that the weather was cold and cloudy, with a cold wind blowing across the track, the opening on Friday was an auspicious occasion. Nearly 10,000 people were in the grandstands and they were fully prepared to see the records go aglimmering, as phenomenal speeds had been recorded in preliminary practice. The time trials opened the program and Caleb Bragg, in a Fiat, started the ball whirling by a circuit in 37.56 seconds. "Me & My Car" Oldfield followed with a mile in 36.22 seconds, and Ben Kircher, in an old Vanderbilt Darracq, turned two miles in the record-breaking time of 1:18.29, DePalma following for the five miles record in 3:15.62. Robertson drove his Simplex 10 miles in 6:31.37, which also was a record.

From a competitive standpoint the 5 miles free-for-all and the 100 miles stock chassis race for cars within the 231-300 cubic inches classification proved the thrillers of the afternoon. In the free-for-all De Palma in his Fiat and Robertson, in a Simplex, raced hood to hood the entire distance, with

Kircher close up, DePalma winning at the tape by a scant length. In the 100 miles Harroun (Marmon) and Siefert (Dorris) made the race interesting. Not more than a length separated them for 95 miles of the 100. In the last five miles Harroun drew away from Siefert and won the race and cracked his own record, as stated elsewhere. The summaries:

Time trials—One mile, Oldfield, Benz, 36.22; Caleb Bragg, Fiat, 37.56. Two miles, Ben Kircher, Darracq, 1:18.29. Five miles, Ralph DePalma, Fiat, 3:15.62. Ten miles, George Robertson, Simplex, 6:31.37. The 2, 5 and 10 miles times are world's records.

Ten miles for stock chassis, 161-230 cubic inches—Won by Endicott, Cole; second, Nikrent, Buick; third, Hampton, Ford. Time, 9:03.25 (record).

Ten miles stock chassis, 451-600 cubic inches—Won by Oldfield, Knox; second, Hanshue, Apperson; third, J. B. Marquis, Isotta. Time, 7:49.25.

Five miles free-for-all—Won by DePalma, Fiat; second, Robertson, Simplex; third, Kircher, Darracq. Time, 3:16.30.

One hundred miles stock chassis, 231-300 cubic inches—Won by Harroun, Marmon; second, Siefert, Dorris; third, Livingston, Corbin. Time, 1:25:22.1 (record).

Saturday—April 9th.

"Me and My Car" Oldfield had let it be known that he intended to shatter DePalma's record of 3:15.62 for 5 miles on Sat-

than DePalma had done the previous day. DePalma tried for the mile, but couldn't do better than 38.35, while Bragg's time for the same distance was 39.22. Robertson also tried for the 5 miles, but he was slower than Oldfield, finishing in 3:17.34.

With the time trials cleared out of the way, the spectators turned their attention to the real racing of the day. In the 10

Time trials—One mile, De Palma, Fiat, 38.35; Bragg, Fiat, 39.22. Five miles, Robertson, Simplex, 3:17.34; Oldfield, Benz, 3:15.71.

Five miles stock chassis, 451-600 cubic inches—Won by Oldfield, Knox; second, Hanshue, Apperson; third, Marquis, Isotta. Time, 3:42.20.

Ten miles handicap, stock chassis—Won

"ME AND MY CAR," NOT TO MENTION MY CIGAR

miles free-for-all Robertson and Bragg kept side by side until seven miles had been reeled off in better than 40 seconds to the mile, when Robertson drew a lead of a yard. This was increased a length in the next mile, and he won out easily in 6:35.06.

by Hampton, Ford (3:10); second, Livingston, Stoddard-Dayton (1:25); third, Oldfield, Knox (scratch). Time, 10:10.10.

Ten miles free-for-all—Won by Robertson, Simplex; second, Bragg, Fiat. Time, 6:33.06.

Fifty miles stock chassis, 161-230 cubic inches—Won by Endicott, Cole; second, Nikrent, Buick; third, Miller, Warren-Detroit. Time, 43:49.69 (record).

Sunday—April 10th.

The good racing for the first two days of the meeting sufficed to bring out a crowd of 12,000 spectators to the third afternoon's carnival of speed, and they did not go home dissatisfied, for a number of records were sent soaring skyward, and the first accident of the meet—a spectacular one, too—was recorded. Fortunately the mishap did not result seriously.

It occurred in the 50 miles "Venice Sweepstakes," open to stock chassis within the 451-600 cubic inches classification. Four drivers started in the race—Oldfield (Knox), Marquis (Isotta), Livingston (Stoddard-Dayton) and Hanshue (Apperson). Oldfield soon retired with a broken valve spring and Livingston was delayed five miles by a puncture. Marquis then took the lead, with Hanshue chasing him and Livingston trying hard to pass the latter. The cars had passed the judges' stand a few yards when the Apperson's right rear tire rolled off and the car swerved up the track. Hanshue twisted the wheel, and it came down so quickly that he went off the boards into the sand strip circling the inside of the track. The momentum of the car was so great that the big machine rolled over four times before stopping. Hanshue did not extricate himself until the car rolled

RALPH DE PALMA IN THE 200 H.P. FIAT RACER

urday, and consequently the big crowd was in a state of expectancy when the peculiarly shaped Benz came out on the track for the 5 miles time trial. Had the race been timed by a hand-controlled stop watch Oldfield might have erased DePalma's performance from the hall of fame, but an electrical timing apparatus that records to the one-hundredth part of a second is a most precise instrument. Oldfield came dangerously close to DePalma's mark, but the timing machine made it 9-100 second slower

In the 50 miles event for stock chassis in the 161-230 cubic inches class another pretty race was witnessed. Nikrent in a Buick and Endicott in a Cole alternated in setting the pace until the last five miles, when the latter forged ahead and finished with a wet sail, 100 yards in the lead. His time—43:49.69—constitutes a class record. Hampton in a Ford won a 10 miles handicap for stock chassis and Oldfield took the 5 miles for 451-600 cars in a Knox; his time was 3:42.20. The results:

over twice, while Carey King, his mechanic, was thrown clear the first time the machine began somersaulting. The men were unconscious when taken to the hospital tent, but soon revived, and, excepting some bad bruises, apparently were none the worse for their accident. Marquis continued and won the race and incidentally cracked the record. His time was 39:20.69. Livingston finished second.

The five miles free-for-all was the prettiest race of the day. Bragg, Robertson and Kircher started, but the last-named could not hold the pace and dropped back after nosing the way for a mile. Robertson then went to the front and remained there until

Fifteen miles stock chassis, 161-230 cubic inches—Won by DePalma, Fiat; second, Marquis, Isotta; third, Kelly, Hupmobile. Time, 17:07.81 (record).

Five miles "Chandler & Lyon" handicap—Won by Lescault, Palmer-Singer (1:00); second, Livingston, Stoddard-Dayton (0:35); third, Marquis, Isotta (1:00). Time, 3:23.16.

Five miles stock chassis, 231-300 cubic inches—Won by Harroun, Marmon; second, Siefert, Dorris. Time, 3:15.89 (record).

Fifty miles stock chassis "Venice Sweepstakes," 451-600 cubic inches—Won by Marquis, Isotta; second, Livingston, Stoddard-Dayton. Time, 39:20.69 (record).

GEORGE H. ROBERTSON AND HIS SIMPLEX RACER

the last mile, when Bragg opened to the limit, drew even with Robertson and passed, winning out by a couple of lengths. The race was worth all the applause it received. Just before that Robertson won the 5 miles free-for-all handicap, starting from scratch.

The record trials at the 1 and 5 miles distances did not produce any new times, but Robertson and Kircher took a whack at the 3 and 4 miles distances, there not having been any previous speedway records for these distances. Robertson thereby established a 3 miles record in 1:58.90 and Kircher a 4 miles mark in 2:40.76.

Two other records also went by the boards. In the 15 miles for stock chassis between 161 and 230 cubic inches, DePalma in a little Fiat won from Marquis in an Isotta in 17:07.81, and Harroun, driving his Marmon flier, cracked the 5 miles mark for cars in the 231-300 class. He covered the distance in 3:15.89 and defeated Siefert, who drove a Dorris car. The summaries:

Time trials—One mile, Bragg, Fiat, 38.52; Oldfield, Benbz, 36.90. Three miles, Robertson, Simplex, 1:58.90. Four miles, Kircher, Darracq, 2:40.76. Five miles, DePalma, Fiat, 3:40.27. The 3 and 4 miles times are world's records.

Five miles free-for-all handicap—Won by George Robertson, Simplex (scratch); second, Lescault, Palmer-Singer (0:50); third, Livingston, Stoddard-Dayton (0:30). Time, 3:29.38.

Five miles free-for-all—Won by Bragg, Fiat; second, Robertson, Simplex; third, Kircher, Darracq. Time, 3:15.89.

#### New Yorkers Oppose Retaliation.

At the regular quarterly meeting of the directors of the American Automobile Association in New York State last week, resolutions were adopted to the effect that the national body was, opposed to retaliatory legislation in securing the passage of state automobile laws. During the remainder of the Congressional session the legislative board will continue to work for the passage of the Federal legislation bill. In accordance with the suggestion of President Lewis R. Speare, who tendered a report as chairman of the special committee delegated to wind up the unsettled claims of the 1908 Vanderbilt Cup race, the following resolution was adopted:

"Resolved, That the national board of directors of the American Automobile Association recognizes the substantial credit

due William K. Vanderbilt, Jr., in his disregard of all technicalities and voluntary assumption of the unpaid items relating to the 1908 Vanderbilt Cup race, and herewith expresses its high regard for a sportsman who has given so much time and personality to the general advancement of automobile competition."

#### Saunderson is A. C. A.'s New Head.

Succeeding Judge E. H. Gary, who declined re-election, Henry Saunderson, former vice-president, was elected to the presidency of the Automobile Club of America at its annual meeting on Tuesday of this week, 12th inst. The other officers elected were: First vice-president, John E. Borne; second vice-president, Robert Lee Morrell; third vice-president, Edward Shearon; treasurer, Ferris E. Marshall. Governors to serve four years: Dave H. Morris, Albert E. Shattuck and E. H. Gary; governor in place of C. Vanderbilt, resigned, Alfred Ely; governor in place of Horace Porter, resigned, George Moore Smith.

The secretary's report showed an increase of 204 active members and 227 new members of the bureau of tours, bringing the total membership up to 2,282. A constitutional amendment providing for the withdrawal of the club room membership was passed by a narrow margin of one vote after considerable discussion. Another constitutional matter settled established a definition in respect to non-resident membership. Henry Saunderson, the new president, who is 42 years old, is the youngest man who ever has served in that capacity. He is a well-known motorist and has served the club in a number of important offices, notably as chairman of the executive committee and chairman of the building committee which is erecting the new \$800,000 annex to the club.

#### Connecticut Visitors Need Front Tags.

Although the Connecticut automobile law possesses a reciprocity clause in respect to the admission of automobiles registered in accordance with the laws of the home states of their owners, it also contains a possible snare to motorists residing in states such as New York, which only require one license tag to be carried. A somewhat obscure paragraph of Section "10," which embodies the reciprocal provision, also stipulates that "Two markers be placed on the cars (of non-residents), as is required of cars registered in this state." The provision has been made the subject of an opinion by Attorney-General Holcomb, who holds that the requirement for two tags holds, regardless of the specific provision of the laws of other states in the matter.

#### Orphans' Automobile Day Selected.

Thursday, June 2d, will be Orphans' Automobile Day in New York City. As usual, the place for the day's outing will be Coney Island, although the exact amusement resort has not as yet been selected.

## LOS ANGELES'S BOARD TRACK

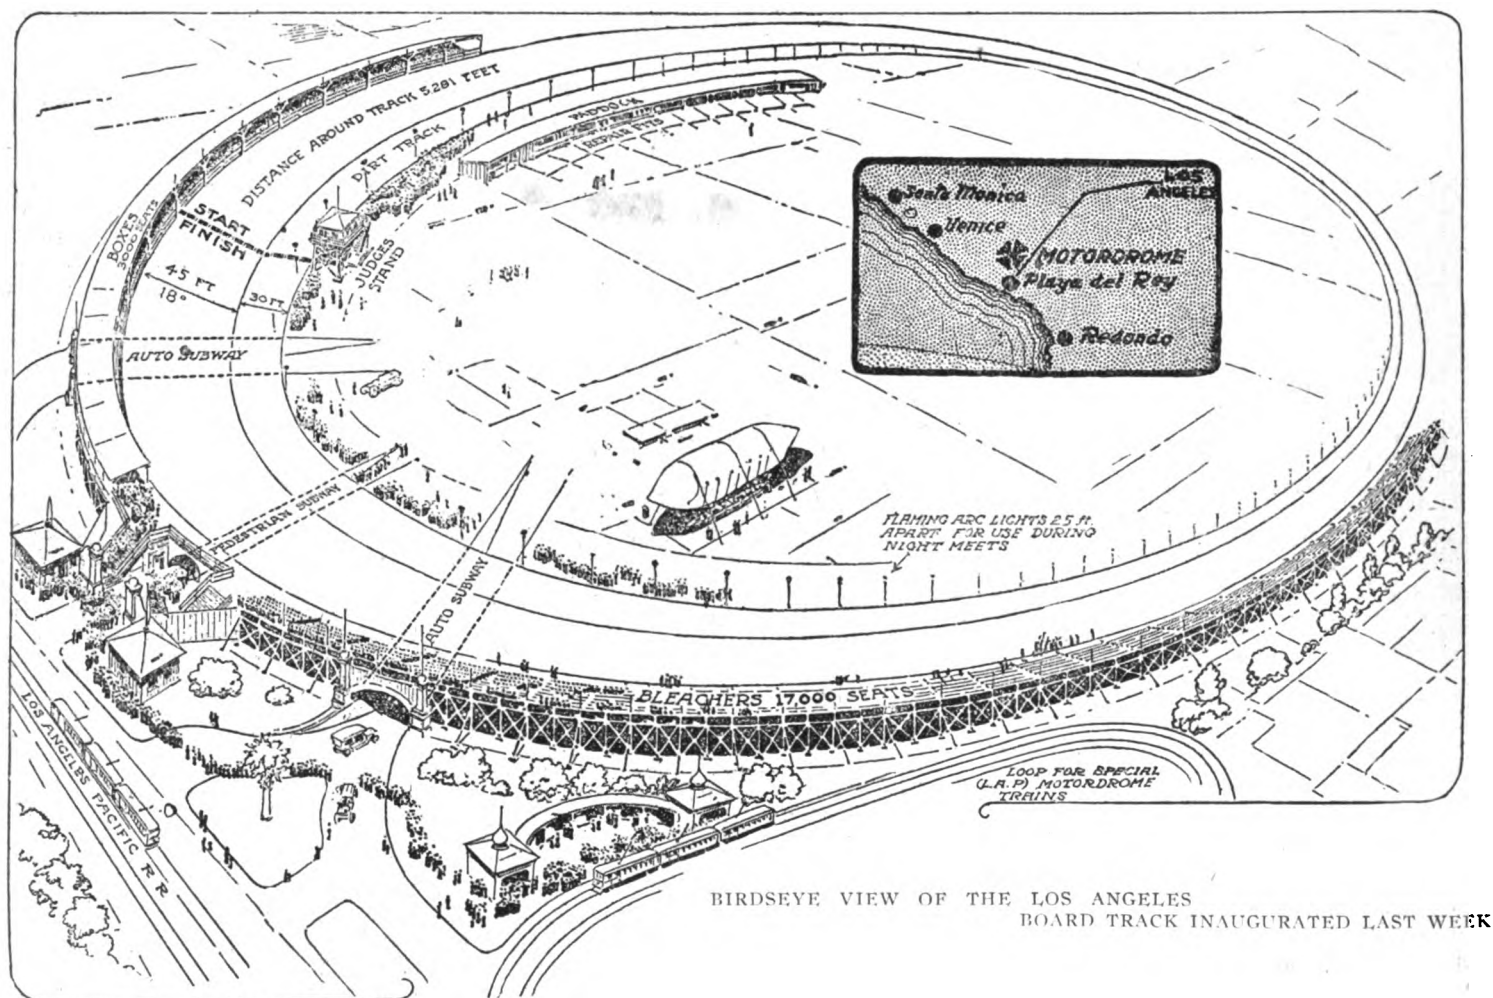

**Its Successful Inauguration a Triumph for a Veteran Track Builder—Some Features of Its Construction.**

Although the new Los Angeles motor-drome is hailed as a tremendous innovation in track construction, its only novelty is in its application to automobile racing. Board tracks have been built and used for many

at the outer rim. The track is 75 feet in width, built with a wide, flat inside free-board or "pole." It is built of the finest quality Oregon pine, which is said to be the very best wood to stand the sun without warping and cracking. So little rain falls on the Coast that warping through dampness does not have to be taken into consideration. Inside the board "pole" a circle of loose sand 10 feet in width all around will act as a natural brake to a car should it slide from the track owing to an accident.

spikes and bolts were used in erecting it. During its construction it was tested in a practical way by running a large number of touring cars over its surface, thereby subjecting it to a load much greater than that it would be called upon to withstand in the ordinary course of racing events.

The course is situated about five miles and a half from Playa del Rey, a short ride on the Los Angeles Pacific line from Los Angeles. For night racing the track will be lighted by seventy arc lamps of 4,000 candle-

years for bicycle racing and, indeed, Jack Prince, constructor of the huge wooden dishpan at Playa del Rey, who has built more board tracks than any other living man, already has to his credit two motorcycle saucers, one at Los Angeles and the other at Springfield, Mass., upon which all world's motorcycle records have been broken. Despite the lack of novelty in the form of the course, however, its application is new and the undertaking is by no means lacking in difficulty. Building a board track to uphold the weight of a large number of motor cars is altogether a different matter from building a track for cycles, whether pedal or motor propelled.

The new course is a true circle, exactly a mile in circumference. It is banked all around at an angle of 20 degrees, and is 25 feet high

Judging from the reports of early trials on the track, it seems likely that the contention that it is destined to prove free from skidding tendencies is likely to be borne out. The surface has been coated with an absorbent powder formed of crushed shells, which has been well rubbed in, and which is intended to absorb all oil and moisture dropping from the cars. In general, however, the probability of its freedom from skidding is based on the high coefficient of friction which obtains between rubber and wood, and which is higher than between rubber and most other smooth surfaces.

In the construction of the track 3,000,000 feet of two-by-four plank in 15 foot lengths and four-by-six under supports have been utilized, while more than 100 tons of nails,

power each, placed 40 feet high, and overhanging the track.

Three cemented subways connect the arena parking space with the outside, two of these being for machines and the other for pedestrians. Seating arrangements for 40,000 persons have been built, the covered box seats on the homestretch side accommodating 12,000, the remainder to be taken care of in the bleachers, located on the north side of the saucer.

### Club Offers to Oil Roads.

The Automobile Club of St. Louis, Mo., has offered to pay half of the cost of oiling the 100 miles of roads in the county during the year, provided the county will raise the necessary funds to defray the other half of the expense.

## MOTOR SLEIGH FOR POLE SEEKING

**Ingenious Vehicle Designed for the Scott Expedition—Its Construction and the Purposes It Will Serve.**

Although public ardor in regard to pole-chasing expeditions has been quenched by the rapidly succeeding emotions evoked by the controversy over right of discovery in the case of the northern terminus of Arctic travel, proposed ventures in Antarctic regions still possess a certain interest which is enhanced by the projected use of motor vehicles in the inevitable and melodramatic "dash to the pole." Indeed, were it not for

the high speed gear permitting a speed of  $3\frac{1}{2}$  miles per hour, while the low gear allows speeds up to two miles per hour. In order to obtain this abnormal gear ratio, a worm drive is employed in the rear axle casing. Owing to this extraordinary low gear no brakes are necessary, and if it is desired to haul the sleigh by man power or to coast it down an incline, the worm wheel may be declutched from the live axle.

As shown in the accompanying illustrations, the most conspicuous feature of these sleighs is the peculiar driving mechanism. The wheels, of which each sleigh has four, do not touch the ground at all. Two large endless chains are mounted so as to run over chain wheels that revolve on the front and rear tubular axle casings, and these

said to be considerable, and to represent the efforts of from 20 to 25 dogs. The saving in freight carried is therefore considerable, for the amount of gasoline, oil, and a few spare parts, do not total as much as feed for a score of "huskies."

### "Back Kicks" Cause Most Accidents.

Kicking motors stand forth conspicuously as a source of anxiety to automobile casualty and insurance companies, as well as of anguish to the motorists who are so unfortunate as to encounter them. Two hundred and thirty-five kicks cost one company of this class nearly \$20,000 last year, according to the annual report for 1909 which just has been issued. Though, as frequently has been pointed out, a most prevalent

"SOUTH-SEEKING POLE" OF TRACTOR

MOTOR TRACTOR SLEIGH FOR ANTARCTIC EXPLORATION

this stimulous the cause of the motor sleigh might languish. As it is, they are promised some little prominence in connection with the plans of Captain Scott, who is projecting a trip to the extreme south. The motor equipment which is destined to figure in the Scott expedition is of a type which has been developed by the Wolseley Tool and Motor Car Co., of England, and which presents many novel features. Foremost of these is the absence of any form of steering mechanism, the machines, which are designed solely for tractor purposes, being intended to be guided by means of two ropes attached to the front end.

The sleighs are fitted with 12 horsepower gasoline engines of the conventional vertical type, air-cooled, with four cylinders cast in pairs. The carburetter, which in the cold atmosphere of the Antarctic would offer great difficulties, is provided with a jacket through which the exhaust is led, and also with a heating pan in which alcohol may be burned when it is desired to start the motor. For lubricating the gears and other parts of the machinery a special brand of oil is used which is capable of withstanding the low temperatures. The clutch is of the leather cone type, while the power is transmitted by shaft drive. Two speeds forward are provided, and none for reverse,

chains have spiked pattens attached to their rollers. These spiked sections grip the ice and hard snow and furnish a secure hold for the driving wheels. Power is supplied to the chains by the live axle in much the same manner as in the regular motor car. When the sleigh is propelled forward, the spikes catch the ice and remain stationary, while the sprockets run over the chain much as the cogwheels of a mountain railroad run over the cogs. The result is that the lower part of the chain remains stationary while the upper part travels at double the speed of the machine. The system is practically an adaptation of that used in the Pedrail tractor.

The seat for the driver takes the form of a perfunctory square wooden box fixed immediately behind the engine. The gasoline tank is made to form the top of the bonnet that encloses the engine. No provision is made in the construction of these sleighs for steering apparatus for the reason that they will be used only on icefields, where the only direction necessary to follow is that of the compass, or possibly, that required by more level ground. If it becomes necessary to change the direction of the sleigh, two men walking ahead pull the front part around by main force.

The pulling force of these machines is

cause of automobile accidents, it has proved by no means the most expensive from the insurers' standpoint, since such injuries for the most part are of a minor nature.

Tinkering with the motor and trying to make adjustments or repairs, while possessing merely a superficial knowledge of the engine and its working was responsible for injuries to 128 of the policy holders, for which they collected some \$7,200. Collisions were next in number of accidents, being responsible for injuries to 117 persons and costing this one company over \$40,000. Skidding or running into ditches was the cause of 105 motorists collecting \$21,479 from the company. But of all the accidents none showed a greater percentage of fatality than the bursting of tires. Although only twelve such accidents happened to policyholders of this company, two of them, or  $16\frac{2}{3}$  per cent., resulted fatally.

### Protection of the Spare Tire.

Spare tires which are carried on the machine always should be amply protected against the effects of the weather. Unless one of the numerous forms of water proof canvas or leather tire casing is used, the spare shoe may be wrapped in oiled linen such as is employed by the tire makers in the original wrapping of the casings.

**OPINIONS GLEANED FROM OWNERS**

**Jeffery Takes a Mail Vote to Discover What Factors They Value Most—Replies Prove Instructive.**

While it might be supposed that popular taste in the matter of car specifications and the invisible qualities underlying them is best expressed in terms of the popularity of any given make or model, such a view is open to numerous objections. Evidently believing implicitly in the value of the ballot as a means of obtaining direct information in this direction, Thomas B. Jeffery & Co. have taken a mail vote in an effort to determine just what characteristics the average motorist most values in the car which is destined for his own use. Practically every Rambler owner in the country contributed his opinion in the form of answers to the series of questions submitted. The result was a general agreement on the importance of at least ten of the points which must be considered in choosing a car.

Ninety per cent of the owners agreed that the buyer should first make sure that the car is the product of a maker whose reputation and investment give assurance that he will still be in business when the car becomes old and worn and needs repairing and an occasional new piston, valve or other part.

Over one-half of the owners specified accuracy in the shaping and fitting of parts as next in importance, agreeing that the car should not be an assembled product but one produced in a plant where all parts are made. In this way alone, they pointed out, could the owner be sure of parts properly made.

The next point for the buyer to consider, according to the Rambler owners, is the possibility of at some time desiring to dispose of the car to purchase another.

The better a car is when it is new and the more responsible the manufacturer, the more the car will be worth when you want to sell. In other words, the quality of the car, according to these owners, determines its permanent value.

The majority emphasized the necessity of quality predominating over price in the making of an automobile. The average price of cars produced in factories where every part is made and made properly is between \$2,000 and \$2,500. About one-half of the Rambler owners contended that a real high class car could not be purchased today for less than \$2,500, while the rest were divided between amounts ranging from \$1,800 to \$2,500.

Those features voted as most desirable by the owners included the long wheel base because of the advantage in traveling over rough roads.

Light cars were not favored, the majority

specifying that a car should be heavy enough to provide ease of riding.

The weight of opinion was against the short wheel base because of vibration, which causes deterioration.

Big wheels and tires were voted unanimously as being necessary to comfort in riding, besides being proportioned, of course, to the weight of the car.

Extremes in horsepower were found unpopular, the average being between 34 and 45 horsepower.

Accessibility of parts was demanded by practically every owner; that is, the ability to move any one part of the car without disturbing all others.

Many owners considered the brakes almost as important as the engine.

The weight of opinion seemed to be that the safest brakes are those which are quick acting and easily adjusted. Poorly adjusted brakes are often tolerated and result in accidents.

**Dealing with Motor Truck Axles.**

Although many car manufacturers continue to produce their own axles, the extent to which the stock product has been adopted is not generally appreciated, either in connection with the pleasure or commercial types of vehicle. In which connection it is interesting to note, in the recently published motor truck axle folder of the Timken-Detroit Axle Co., Detroit, Mich., the statement that 85 per cent. of the successful truck makers at present use the Timken axle products. The booklet, which is in catalog form, conveys much information of a vital nature pertaining directly to the equipment of commercial vehicles, and suggesting types and sizes suited to various sizes and types.

**Where Tool Thieves are Skilful.**

Stealing tools from the back lockers of motor cars while the latter are being driven at a fair rate of speed, does not appear to be so very easy at first glance. The habit, however, is said to have become prevalent in England. It seems that gangs of bicycle riders, will follow a motorist for a considerable distance along lonely roads, closely hugging the car, and helping themselves to any parts they can pry off, or to the tools they can extract from the tool chest, even going so far as to unscrew the rear lamps from their brackets.

**To Enforce Extinguishment of Lamps.**

An order has been sent out to all the steamboat inspectors by the United States Inspector General in Washington, stating that the law prohibiting the transportation of motor vehicles on ferries unless the lights are extinguished will be strictly enforced this season. There has been some laxity in the matter hitherto, many ferry companies permitting cars to be run on board with the lamps lighted, although drivers were required to extinguish them after the machines had been brought to a stop.

**THE INFLUENCE OF PSYCHOLOGY**

**Harvard Professor Declares It Affects Owners of Automobiles and Points Out How It Does So.**

With the great increase of automobile driving in this country, the need of some regulation regarding the men and women entrusted with the handling of motor cars has become apparent, and many attempts have been made to formulate plans which would prove satisfactory both to the drivers and to the non-motoring public. One of the most original and scientific of such proposals has been advanced by Professor Charles Sherwood Ricker, of the Department of Psychology at Harvard University. The latter declares that a great many persons are physically and mentally unfit to drive automobiles, and that it is a part of the duty of experimental psychology to find these deficient persons before they can do any harm by driving motor cars recklessly or carelessly. He declares that operating an automobile is not solely a matter of skill, but is to a certain extent a matter of constitutional limitations.

"The chauffeur," says the professor, "must be able to react quickly to these objects about him, and this reaction often involves two or more distinct movements. It is a well known fact in psychology that certain individuals will show a remarkably quick reaction time when only one movement is demanded, but that when two or more movements are necessary some individuals are as helpless as a paralytic to make the second and third efforts.

"It seems that in such cases all the surplus nervous energy is directed along the path which causes the first movement and none remains for the subsequent ones. Such individuals are obviously not competent to drive motor vehicles where a thoughtless youngster may try to run across the street in front of a passing automobile and suddenly realizing the impossibility of succeeding attempts to turn back.

"The natural movement of the chauffeur would be to turn in and pass behind the boy, but the unexpected action of the youngster places him directly in front of the machine and quick work must follow. The emergency brake must be put on, the clutch released or the reverse set in, together with a skilful handling of the steering wheel, and all the activities apparently simultaneous. Where would a slow reactionist be in such a predicament? The muscular reaction times of many are comparatively slow even though the mind may be alert. Accuracy and speed of movement may mean at such a time the loss or saving of a life and yet these questions are not considered by any highway commission in the country."

Following which it appears that the professor's interest in the subject in some

measure hinges upon an apparatus of his own invention which is intended to aid in the discovery of such "deficiencies."

"With the idea of a practical application of psychology in the automobile world," he says, "I have prepared a simple piece of apparatus for the measurement of the reaction time in hundredths of a second of prospective chauffeurs and other motor car drivers. The apparatus may be connected to the frame of an automobile, with the driver's seat, a wheel of the conventional size, a foot clutch release, an emergency brake and a dummy throttle, or it may be attached to any standard machine for actual road tests.

"In either case the wheel is so arranged that any movement makes a metallic contact, completes an electric circuit, and drops an arm or pointer upon a revolving cylinder covered with smoked paper. This is the time recorder. The clutch release controlled by the foot also completes a circuit after a movement of one-sixteenth of an inch, dropping another arm upon the cylinder, as does the emergency brake and the throttle.

"In place of the ordinary wind shield the operator faces an opaque screen with three openings an inch and a half in diameter. Behind the openings are different colored electric bulbs so arranged on spokes that they may be readily changed. The colors are white, green and red, and are manipulated by means of push-buttons, which also connect with the revolving time recorder and drop additional arms upon the smoked paper.

"The operation is exceedingly simple. Each color or combination calls for certain definite responses on the part of the operator, such as turning, slowing down, stopping, reversing, etc. Pushing of a button by the examiner throws a certain light upon the screen and automatically registers the time on the smoked paper. The reaction of the driver is also recorded on the cylinder and the time between the pushing of the button and the turning of the wheel or lever is the reaction time for the individual.

"The sight and hearing of an applicant should likewise be examined. There are hundreds of persons who should be wearing glasses and nearly as many who are hard of hearing. Any of these desiring a license might very easily, through ignorance or design, fail to explain their shortcomings to the ordinary examiners. The near-sighted individual might get along well in the daytime and at dusk mistake a speeding automobile in the distance for a slow moving team. Again, another individual might hear the toot of a horn in front or at his side and yet owing to a slight deafness be oblivious to a warning 'honk' on a dangerous curve."

Professor Ricker furthermore calls attention to the element of fatigue which, in his opinion, is responsible for a great many accidents. "The driving of an automobile through crowded city streets is the

greatest strain outside a narrow escape which can well be imagined. Ought the chauffeur who has driven his car all day through the crowded streets be allowed, fatigued as he must be, to handle his car half the night through bright lights and deep shadows? These conditions are especially severe in the demand on attention, reaction time, the eye and the ear."

#### Remy Offers Two Rich Prizes.

By far the richest and most unique prizes ever offered for motor competition will be fought for at the Indianapolis (Ind.) Motor Speedway meets this summer. In addition to the G & J, Prest-O-Lite and Wheeler & Schebler trophies, Frank Remy, of the Remy Magneto Co., Anderson, Ind., will offer a \$15,000 trophy, the design and size of which is yet to be announced, as are the conditions under which it will be competed for.

The Remy Brassard which last year carried with it a weekly stipend of \$75 to its successful defender, will, this year bring an income of \$150 a week to the holder, and \$75 weekly additional if his car is equipped with a Remy magneto. The first award will be styled the Grand Brassard, and the second the Lesser Brassard. An innovation in prizes has been introduced by Carl Fisher, who has put up a silver helmet, which further is distinguished by the fact that it will not be a first prize, but will go to the winner of second place in the ten miles national championship on May 30, for stock cars in the 451-600 displacement class.

It will be competed for four times throughout the season and will carry with it a weekly income of \$50. The winner must wear it in competition, and it will become the permanent property of the holder at the close of the season. Another new addition to the prize list is the Wilson trophy, valued at \$150, which will be awarded to the stock touring car of not over 50 horsepower which, with full equipment, and carrying four passengers, first covers a mile in 1 minute or under. A mile is to be driven each way around the track, to compensate for grade variations. The opening meet will be held May 27, 28 and 30.

#### Mayor Fails to Close Boston Parks.

Boston, Mass., has become the center of a brisk local tempest because of the threatened closing of its parks to automobiles. Mayor Fitzgerald has become obsessed with the idea that because extensive use of the local park systems is made by automobiles, it is wrong for the entire income from registrations and fines to be turned over to the State Highway Commission. The first indication of the obsession was a petition presented to the Legislative committee on roads and bridges, which is engaged in preparing sundry amendments to the existing automobile laws. Failing of recognition in this quarter, His Honor turned his attention to the Boston Park Commission and the Metropolitan Park Commission,

suggesting that the parks be closed to automobiles during the coming summer. This the respective commissions have power to do, subject to the approval of the State Commission.

The Metropolitan board responded with an expression of confidence in the wisdom of the Legislature in apportioning the funds to the highway commission, and declining to act as suggested. In the same connection, the highway commission has written the Mayor modestly requesting him to furnish it with a complete list showing the number and valuation of cars taxed in Boston, the amount of taxes collected from persons or property in any way engaged in the automobile business, the valuation of property occupied by those so engaged and the number of people and amount of capital engaged in the industry—if possible.

#### Minneapolis Elects and "Resolutes."

At the annual meeting of the Minneapolis (Minn.) Automobile Club last week, the following officers were elected for the ensuing year: George M. Gillette, president; Herbert J. Clark, first vice-president; Charles B. Velie, second vice-president; G. A. Will, secretary; Louis Koch, treasurer. Chairmen of the various committees also were appointed as follows: Asa Paine, house; A. M. Robertson, laws and ordinances; Harold Vorce, sign posts; G. A. Will, good roads; G. H. Feeley, membership; Dr. C. E. Dutton, tours and contests. Resolutions were adopted requesting the legislature to appropriate a \$100,000 bond issue for good roads in Hennepin county, and to compel all vehicles to carry both front and rear lights.

#### New Haven Club Choose Officers.

At the annual meeting of the New Haven (Conn.) Automobile Club last week, all of the old officers were re-elected as follows: Thomas G. Bennett, president; Jacob P. Goodhart, vice-president; W. T. Dill, secretary; Clarence E. Thompson, treasurer. Vice-President Goodhart was delegated to inspect suitable quarters for club rooms, the club contemplating vacating its present rooms.

#### Clubmen to Act as Policemen.

Imitating the methods of the Russian secret service, the members of which are not known to each other, the president of the St. Paul Automobile Club has appointed fifteen of the members of the club as "automobile detectives" who will assist the local police in having the speed laws enforced.

#### Fisher Heads Indiana Association.

Convened in annual session at Indianapolis, Ind., during carnival and show week, the Indiana State Automobile Association elected officers for the coming year as follows: Carl G. Fisher, president; A. D. Clessler, E. MacMorris, vice-presidents; F. I. Willis, treasurer; A. R. King, secretary.

## PIERCE-ARROW'S ENLARGED PLANT

**Huge Additions Completed and Nearing Completion—Measurements that Convey an Idea of Its Immensity.**

Of the two most patent indications of expansion in the automobile industry, the constant influx of new concerns and enlargement in the scope of existing organizations, the latter may be accounted by far the healthier sign. Especially is this the case when the operations of one of the pioneer manufacturers continue to widen year after year until they embrace an industrial unit fit to be classed in point of magnitude with

double the working area, while ultimate plans call for something over a million square feet of floor space, all to be devoted to the production of cars and the tributary operations. Late in the fall of 1909 work was begun on the extensive scheme of factory enlargement, which is now well under way. First to be completed was the addition to machinery hall, one story high, 75x204 feet in size. On adjoining ground a new store house and assembly building has been erected, which is L-shaped, one leg being 62x305 and the other 50x100 feet; both are four stories in height. In order to provide ample facilities for the body making department the section of the original plant formerly devoted to that work has been enlarged by the addition of two wings,

ished stock will be kept, while the two upper floors will be used for the assembly of construction units such as motors, transmissions, rear axles, carburettors, pumps, steering gears and clutches. Removing from Machinery hall the stock room and inspection department, which formerly occupied a portion of its vast space, considerable additional space will be secured, a portion of which will be used for new ma-

REAR VIEW OF NEW PIERCE-ARROW FACTORY, SHOWING NICKEL PLATING BUILDING AND NEW WINGS

any of the big undertakings of the day. Evidences of both sorts are not lacking at the present time to augur bigger productions and better products for the future. But of the second order no more impressive example is to be found than in the present and projected operations at the plant of the Pierce-Arrow Motor Car Co., at Buffalo, N. Y.

Two years and a little more ago the then new plant in Elmwood avenue was completed and ready for occupancy. Of the most modern type of reinforced concrete construction, carefully laid out and arranged with a view to such growth of the business as then appeared probable, it was

each 250x50 feet and four stories high. These are nearing completion and will be ready for occupancy within 30 days.

For work on the smaller parts which enter into car production the nickel plating building, so-called, is now being erected. It will be four stories high, and 62x184 feet in plan. A one-story addition to the motor testing department, 55x200 feet, is to be constructed within a short time, and a 50x51 foot addition to the one-story power house is about completed. In addition to this a new 150 foot stack, with the name "Pierce-Arrow" inlaid in colored brick, has been finished. With the great increase in manufacturing facilities and the enlargement

chinery. It is claimed that this will afford the largest single machine room under one roof in North America, regardless of the line of manufacturing with which the comparison is made. Heretofore the assembling of units and chassis has been done in one hall 401x122 feet in size, but with the removal of the unit assembly departments to the new building the whole floor, having an aggregate area of something like 50,000 square feet, will be available for chassis assembling and painting.

In adding to the buildings, room has been made for much added equipment which already is in place, while more is to follow as fast as there is room for it. Machinery

VIEW OF PIERCE-ARROW FACTORY ALONG GREAT ARROW AVE., SHOWING NEW ADDITION ON RIGHT

considered a model plant of its kind, and as such attracted and has continued to attract no small amount of attention. But the market for Pierce-Arrow cars materialized at a rate which exceeded expectations and the inevitable consequence is illustrated by the accompanying pictures.

Operations in the plant as originally constructed were commenced with something over 360,000 square feet of floor space available. The building project at present under way and those contemplated will more than

of the business which it implies added room for office quarters will be required, to which end an extension to the office is planned, which will be 60x220 feet in size and three stories high. The structure will be of brick and reinforced concrete to correspond with the present administration building.

The new working space is nicely adapted to fit into the general scheme of routing the work through the factory. On the two lower floors of the new storage and assembly building raw materials and some fin-

hall already has its new quota of machine tools, while to take care of the added "load," the boiler capacity in the power plant has been increased by 2,000 horsepower and a new 1,000 horsepower engine put into commission, while economizers have been installed in connection with all the boilers. Needless to add, the increased capacity of the plant will require corresponding additions to the working force, which even now is not small. At present it numbers no less than 2,600 employees.

## INGENUITY IN THE HOROGRAPH

**Latest Warner Timing Instrument Delivers Printed Record of Car Speeds—  
How Accuracy is Checked.**

How the times of flying motor cars are caught in hundredths of seconds is a problem which continues to puzzle the masses despite the fact that for many months it has been done successfully and without the least element of secrecy by apparatus of unquestioned accuracy. Progress in this, as in other lines connected with the development of the institution of automobile racing, however, has brought about the adoption of

a time registering device of absolute and unvarying accuracy and of correlating with it an indicating device sufficiently sensitive to be of instant response and, furthermore, absolutely unvarying in its reliability.

A general idea of the way in which these principles have been employed in the Horograph may be gained from the accompanying illustration, which shows the complete apparatus ready to be connected into the numerous electrical circuits which are necessary to its operation. Beside it is shown the chronometer from which an accurate check of the performance of the timing mechanism is obtained.

The primary element in the mechanism consists of a series of four type wheels, suggestive, in a way, of those which are

printed on the constantly moving strip of paper. In this way, a racing car automatically records the exact time of its start and, later, the exact finishing time. The elapsed time, then, may be obtained from the strip by subtraction.

By far the most delicate and important part of the mechanism is the system whereby the type wheels are driven and their speed is checked. The wheels are mounted on and driven by the friction of a shaft which is revolved by an electric motor. At first they are held stationary, but as soon as the car crosses the starting line they are released and print "zero" on the tape. Thereafter they revolve continuously, the hundredths wheel turning once in every two seconds, and the others more slowly and at proportionate rates.

As it is absolutely impossible to construct an electric motor which will revolve with absolutely mathematical uniformity, some method of correction is necessary to compensate for the slight inaccuracies which even the most modern construction and painstaking elimination of faults involves. The method adopted in this case takes the form of an automatic check against the movement of the chronometer. At one end of the driving shaft is a double armed lever in the path of which is a "detent" actuated by a small electro-magnet. Through a relay circuit, the chronometer acts to energize the magnet every second, thus moving the detent out of the path of the lever.

In service, the speed of the motor is so regulated that the shaft turns just a trifle faster than once every two seconds, so that the lever arms touch the detent a perceptible instant before it is withdrawn by the magnet acting under the seconds impulse of the chronometer. This instant contact is sufficiently long to close an independent electric circuit which actuates a little telltale mounted on the base of the instrument. In this way the telltale is made to throb once every second. If the telltale pulsations are of too long duration, it indicates to the operator that the motor is running too fast, and that the arms come into contact with the detent earlier than they should; he therefore reduces the speed of the motor. If, on the other hand, the telltale fails to rise every second, or misses a beat, it indicates that the motor speed has fallen so low that the arms fail to touch the detent before it is withdrawn by the magnet. So accurate is this checking device that the speed of the motor can be regulated to within one-thousandth of a second's variation from the speed of the chronometer.

In actual use, the instrument is protected by cutout switches, which prevent the starting and stopping times from being printed on the tape by accidental means; while telephones connecting the timing booth with various points on the course or track, enable the operators to keep in touch with the movements of the cars, apart from the actual indications of the apparatus.

WARNER HOROGRAPH AUTOMATIC SPEED RECORDER

improved methods calculated greatly to ensure the value of the newer records, particularly where relatively short distances, such as one or two miles, are involved. Some little time ago it fell to the lot of C. H. Warner, of the Warner Instrument Co., Beloit, Wis., to devise a system of timing which involved the use of the chronograph. The system served a useful purpose for a time and did duty in a number of racing and hill climbing contests at which notable performances were achieved. But it is a more highly refined piece of apparatus, known as the Horograph, which was used at the recent Florida meet and is installed at the new Los Angeles motor-drome, which is having its inaugural meet this week. Like its predecessor, the Horograph is a Warner product.

Fundamentally the automatic timing instrument, no matter what its direct application, embodies no very complex theory. It is necessary to have but two distinct elements in the mechanism, as a matter of fact; one to record the passage of time, and the other to imprint upon the automatic record which the first portion of the instrument establishes, an index of the starting and stopping, or "in" and "out," times of the car or other object which is to be timed. The difficulty lies in securing

used in the familiar recording telegraph or news ticker. The characters on the four wheels, however, indicate respectively, hours, minutes, seconds, and hundredths of seconds. The wheels are driven in much the same way as the rings in an odometer instrument. Over them runs a strip of paper, and above that a typewriter ribbon. Periodically a hammer actuated by an electro-magnet strikes the ribbon and paper against the type wheels, thus making a record of the exact time on the paper every time the electric circuit energizing the magnet is closed.

In the circuit of the magnet which operates the hammer is a relay, or electrically operated interrupter, in a second circuit, which normally is closed. It is this circuit which is governed directly by the starting and finish tapes which are stretched across the course. The tape, or wire, which is carried a few inches above the ground, is attached at one end to a switch which is ingeniously constructed in such a fashion that it is opened by the shock of impact when the wheels of a racing car contact with the tape, rather than by a gradual increase in tension, such as might be caused accidentally. When this controlling switch is opened by the passage of the car, the hammer drops and a record of the time is

**BOSCH'S NEW DOUBLE IGNITION**

**Two Wholly Independent Systems Developed—Novelty in Timer-Distributor and Synchronous Coil.**

Despite the continued success of the dual ignition system, whereby two virtually independent sources of current are provided with but a single set of spark plugs, many engineers continue to prefer the double igni-

only interconnection between this and the other system being at the controlling switch. The other set of plugs is served by the batteries through the synchronous coil and a combined timer and distributor, entirely independent of the magneto and in that respect an innovation. Besides the high tension leads running from the timer and distributor to the plugs, its only other connections are a high and a low tension wire, both of which are led back to the coil.

The coil and switch are the most distinct-

designed that the end is set flush, or nearly so, with the dash or floor board. In addition to this a locking device has been added to it, which introduces the safety feature. The key, which fits into the switch piece, can be withdrawn only when the switch is set neutral. Furthermore, such is the construction that even if the outer screws are removed the lock will still retain the switch in the off position.

The switch is arranged to set in either of four positions, namely, the neutral or "off"

NEW BOSCH SYNCHRONOUS COIL, SHOWING PARTS DISMOUNTED

tion system, as it is sometimes distinguished, or that in which the two systems are kept entirely independent clear through to the two sets of plugs. As the originator of an eminently satisfactory form of dual arrangement, the Bosch Magneto Co., has adhered to that system in the past where two ignitions were required. An entirely new system just has been announced, however,

ive and original elements in the new system, and are combined in an exceedingly compact and cleverly contrived unit which may be set into the dash or floor board of the car.

In many respects this device resembles that which has been used so successfully in the dual system. Like the more familiar arrangement, it includes the synchronous coil

position, and one permitting the engine to be run on the battery with one set of plugs, on the magneto with the other set of plugs, or on both systems simultaneously. When it is desired to start the engine "on the spark" a push button in the center of the switch is depressed. This closes contact through an auxiliary vibrator in the coil, thus producing a spark in the cylinder which stands next in order of firing. Should it happen that the engine has come to rest in such a position that the primary contact is broken, at the timer, no spark would result ordinarily. By depressing the push button to the full extent of its travel, however, a second contact is made, which permits a spark to be developed at any point in the circle regardless of the position of the primary contact breaker.

The accompanying illustration shows the interior construction of the coil, including the major parts, which may be disassembled by the withdrawal of a single screw. The outer housing, the brass cover and the rear cover that protects the connections, are stationary. So also is the switch plate. The coil, however, is connected mechanically with the switch plug and rotates with it, establishing the various connections. The coil is similar in every way to the armature of the magneto so that there is no difference in the ignition sparks produced by the two systems. The windings are of heat-proofed enameled wire, the layers being insulated with a special fabric. The magnetic field is

NEW BOSCH TIMER-DISTRIBUTOR DISASSEMBLED

which provides for two complete and independent systems with two sets of plugs, and which combines with the synchronous coil and self-starting feature of the Bosch dual system a number of novel and no less ingenious features.

By the new method of arrangement, one set of plugs is served by the regular high tension magneto in the regular way; the

and starting button, which is used when the engine is to be started without cranking. In connection with the development of the double independent system, however, it has been modified considerably. The most noticeable change is in the method of mounting and in the transformation of the control. A kick switch now is used instead of the former hand switch, and the coil is so

rendered more than usually complete by the use of laminated soft iron end plates. Built into the lower part of the coil is a heavy fiber block in which are embedded the movable switch contacts, which establish the different connections when the coil is rotated.

The combined timer and distributor is unusually compact in form and of small size. As shown in the picture, the central lead from the high tension terminals on top of the device, conducts the current from the coil to the distributor. The outer leads are connected to the plugs. The parts of the device which may be dismounted without the aid of tools consist of the cover containing the distributor contacts and terminals, a brass housing in the form of a simple ring, and the main body of the device. When assembled, the parts are held in place by two outside springs that snap over conical pins set in the cover. The distributor rotor is of hard rubber, and supported by two pins. Imbedded in it is a brass tube containing a carbon brush that sweeps the distributor contact plates under the pressure of a light spring. It is identical with the distributor that is used in the construction of the standard Bosch magneto. The revolving portion of the timer-distributor is mounted on two ball bearings, which are rendered dust proof by close-fitting caps. The timing lever, of the primary timer, is a single piece steel stamping, and is very large in proportion to the size of the instrument. The platinum points are 5-32 inch in diameter, and the stationary point is provided with an adjustment for the taking up of wear. The primary terminal is located on the under side of the instrument, and a proper ground return is assured through a special connection provided for the ground wire.

#### Quick Work in the Quaker City.

What appears to be the record in the relatively new field of automobile insurance activity happened in Philadelphia a few days ago. Thomas W. Fisher bought a new Packard motor car and immediately insured it for \$3,500. On the evening of the same day, while the car was standing in front of one of the hotels and the chauffeur had stepped into an adjoining garage, thieves managed to get away with it. Although it was but a few minutes later that the theft was discovered, no trace of the missing car could be found. On Saturday last the door of the machine and the chauffeur's seat were recovered in a junk shop, the owner of which claimed to have bought them in the regular course of business and paid \$1.25 for them. The insurance company, deciding that there was no chance of recovery of the whole machine, promptly sent its check for the full amount to Mr. Fisher and he bought a new car.

As a souvenir of this somewhat unusual case, the insurance company displays in its office the stolen and recovered door of the car.

## INCREASING THE WIDTH OF BODIES

**Foreign Designer Shows How It May be Done and Suggests Advantages—Favors New Bonnet Shapes Also.**

That considerable space for possible extension of the body area goes to waste in the average car, is a fact, recently pointed out in these columns, which is perfectly evident upon a moment's thought. Until the present time, it has been customary to limit the width of the average body by the width of the chassis, plus an overhang for the seats amounting to not more than eight or nine inches all told. At the same time, modern commercial vehicle practice reveals possibilities in the direction of increased

NOVEL SEAT ARRANGEMENT FOR TORPEDO

body widths, which also are being utilized in some of the most recent touring types of pleasure car, but which yet remain to be fully appreciated. A suggestion along this line derived from a recent English body design may be applied to some possible advantage. Incidentally it illustrates the possibilities of advantage to be gained in applying the same principle to the construction of enclosed vehicles.

As the illustration shows, the forward portion of the body is brought out flush with the outer edge of the running board and the sides are pierced for only a single door on either side. The extreme total width of body obtained, together with the use of individual seats in front renders access to either front or back seats perfectly easy, at the same time providing a novel arrangement of the seats. This arrangement is supposed to aid in the dust-suppressing qualities of the body by preventing the pocketing of air over the running boards and also in "easing off" the air currents at the back, where the body width is decreased behind the rear seats.

It may be mentioned in passing that the inventor of this odd-appearing structure is in favor of reversing the slopes and curves of the bonnets now in use, in order to secure a rough copy of the lines of a vessel—his idea being that by this means, the body of air through which the vehicle moves would be

less disturbed by its passage than by the ordinary form of vehicle exterior. He also proposes the standardization of lamp brackets mounted on the forward extremities of the front fenders, after a fashion which was tried out in this country several years ago by a concern which has since ceased to exist.

#### Uncle Sam's Newest Mail Wagon.

When the first real mail car was installed on the railroads of the country, it was considered a great achievement to be able to sort and deliver mail while going at such high speed. For a long while, however, little improvement could be noticed in the picking up of mail from the street boxes, and much valuable time is continuously lost through the slow methods of collecting and assorting. Recently the United States Post Office Department has installed an experimental mail wagon in Los Angeles—the second installation of its kind—the work of which is being watched with intense interest by all post office officials in the country, and particularly by those in the big cities.

In construction, this new mail car is a miniature reproduction of the railway mail car. It is a large automobile, fully enclosed by wire netting. The ground floor provides space for a semi-circular dumping table. In the open space as many as five men can work, sorting mail as the car is driven from box to box. Along one side are five sacks for first-class mail, and opposite are three pits for newspapers, magazines and parcels. In a smaller compartment at the rear sits the collector who opens and empties the mail boxes at every street corner.

The car is electric lighted throughout, and the open wire netting provides ample ventilation for the sorting clerks. According to the tests made so far in Los Angeles for some time, each one of these automobiles dispenses with the service of three horses and two men, collects the mail much faster and saves the department the sum of about \$2,000 per annum. Seven cars, all of which are made by the Autocar Co., of Ardmore, Pa., have been delivered to the Philadelphia post office and four have been ordered for Los Angeles.

#### Michigan Town Applies Thumb Screws.

While most of the states of the Union possess laws which distinctly and specifically exempt the automobile from assessment taxes, on account of the license to be paid for its use, Michigan does not seem to have made any such provision. At least the assessor of Port Huron, Mich., has notified the owners of some 82 machines in and about the town, that they will have to pay taxes on their machines at the same rate as is paid for other property. Automobile owners are up in arms over the ruling, and several protests have been filed. Pending a judicial settlement of the argument, Port Huron automobile owners had to pay the assessments.

## LOCAL SHOWS IN SIX CITIES

**Widely Scattered, They Cause Their Respective Communities to Swell with Pride—Season Nears Its End.**

Those wan and drawn salesmen who have been following the local show circuit since its opening last November doubtless will welcome with joy the final stand which fast is approaching. With the staging of local exhibitions in Watertown and Elmira, N. Y., Harrisburg, Pa., Davenport, Ia., Logansport, Ind., and Kalamazoo, Mich., during the past week, the fag end of the current season's crop of show functions has about been reached. In several of the places mentioned shows were held for the first time, and as such of course took first rank in importance in local affairs. Arranged and managed chiefly by the local dealers, they were widely heralded through the immediate territory and attracted many out of town visitors in addition to the townspeople, who lent vigorous support to the exhibitions.

Among the cities making their debut on the show circuit was Kalamazoo, which staged its maiden function under the auspices of the Kalamazoo Automobile Association in the state armory on the 7th, 8th and 9th. On display were 27 makes ranging from the tiny runabout to the huge six-cylinder car, and flavored with a representative display of accessories. The decorations consisted of green and red bunting hung upon the walls and ceiling, while scores of electric lamps released "bottled sunlight" at night. The promoting body, which is composed of nearly all the prominent local dealers, was formed but recently, and is so elated over its initial efforts that it is planned to make the show an annual event. Shown for the first time this year was the Michigan, manufactured by the Michigan Buggy Co.

Following were the exhibitors:

Gasolene cars: J. H. Dore, Maxwell; Kalamazoo Motor Co., Mitchell, Brush, Krit; Russell & Albrecht, Overland; C. H. Fricke, White; Webber & Haines, Cadillac; William Harlow, Buick; George Boyles, E-M-F.; Philip Glass, Ford; Arthur Barry, Haynes; Fred Milliman, Reo; William Kidder, Thomas; F. N. Root, Everitt; Michigan Buggy Co., Michigan.

Steam cars: Russell & Albrecht, Stanley; C. H. Fricke, White.

Electric vehicles: Kalamazoo Motor Co., Detroit.

Accessories: Dayton Airless Tire Co., Standard Oil Co., Topical Oil Co., Monarch Metal Polish Co.

Filling the Kelker street hall to capacity, the first automobile show ever held in Harrisburg, Pa., was inaugurated on Saturday

evening last, 9th inst., sponsored by the newly organized Harrisburg Automobile Dealers' Association, and booked for a week's run. Nearly every dealer in the city has a display, over 50 makes of car being staged, while a few who were crowded out are holding private shows in their salesrooms. Following the fashion of other show committees, the Pennsylvanians have secured as a feature an aeroplane, which is suspended from the ceiling in the center of the hall. Bunting and electric lights are used liberally to transform the hall into an appropriate exhibition room, while palms and potted plants are spread around profusely.

The exhibitors are as follows:

Gasolene cars: Crispin Motor Car Co., Peerless, Cadillac, Palmer-Singer; Cox Automobile Co., Stoddard-Dayton, Courier, Oldsmobile, Oakland; Central Pennsylvania Automobile Co., Buick, Studebaker, E-M-F., Flanders, Jackson, Demot, Overland, Inter-State; Keystone Motor Car Co., Klinekar, Hudson; Andrew Redmond, Maxwell, Columbia, Regal; George Loveland, Apperson; S. S. Johnson, Metz; International Harvester Co., International; Harrisburg Automobile Co., Hart-Kraft, Reo, Rambler, Ford, National.

Electric vehicles: George Loveland, Studebaker; Andrew Redmond, Columbus; Keystone Motor Car Co., Woods.

With cars and accessories of a total value of over \$100,000 on view, Davenport, Ia., made its first venture on the show circuit last week, the exhibition, which was held in the state armory, opening on the 7th and lasting three days. Local dealers were responsible for the exhibition and, due to their energetic efforts, Davenport has every reason to be proud of its maiden show. As a member of the Tri-Cities, the others being Moline and Rock Island, situated across the river in Illinois, Davenport is particularly well situated to attract good crowds, as was attested by the surprisingly large attendance on each of the three days. The show will be an annual event.

Among the exhibitors were the following: P. C. Patersen Auto Co., Velie, Pope-Hartford; Iowa Auto Co., PierceArrow, Cadillac, Thomas; Sanders' Auto Co., Kisselkar, Black-Crow; Klemme Auto Co., E-M-F., Flanders; Roeske & Sindt, Ford; Dillon Auto Co., Hupmobile; Zeman Auto Co., Mitchell; Brandenburg Auto Co., Jackson, Reo, Monitor, Rapid; Mason Auto Co., Peerless, Hudson, Chalmers.

Electric vehicles: Buck Auto Co., Detroit; P. C. Patersen Auto Co., Waverley; Iowa Auto Co., Babcock; Mason Auto Co., Baker, Rauch & Lang; Brandenburg Auto Co., Woods.

Preceded by a parade of decorated cars through the principal streets, prizes being offered for the most tastefully and strikingly

adorned cars, the Automobile and Motorcycle Dealers' Association of Logansport, Ind., opened their second annual automobile show in the Broadway garage on Thursday, 7th inst. The function continued for the balance of the week. Cars were shown by 25 exhibitors, comprising the membership of the association, and the building was prettily decorated to present a forest scene, the spaces harmonizing with the general scheme. To lend interest and create enthusiasm the dealers held a hill climb and novelty race during the progress of the show.

With 33 cars on exhibition, the first automobile show that Watertown, N. Y., ever has seen was held in the state armory, from the 6th to the 9th inst., under the patronage and guidance of the Watertown Automobile Manufacturers' and Dealers' Association. It was not an automobile show exclusively, for although cars were in the majority, motor boats also were on view. Under a canopy of flags, which also adorned the side walls, the cars were tastefully arranged, and all the exhibitors, strange to say, united in agreeing that there was plenty of "elbow room." One of the most prominent displays and one which received a surfeit of attention was that of the town's sole automobile manufacturer, the H. H. Babcock Co., which showed for the first time several models of the Babcock 40-horsepower gasolene touring car. In the basement were located the accessory men, among them being several out-of-town firms, and their wide and varied displays attracted much attention.

The exhibitors were the following:

Gasolene cars: John L. Smith, E-M-F., Flanders; Jefferson County Automobile Sales Co., Whiting, Velie; W. D. Nellis, Reo; Warner Automobile Co., Metz., Ford; L. D. Butterfield, Jackson; Watertown Automobile & Supply Co., Franklin, Chalmers, Hudson, Matheson, Oldsmobile, Oakland, Mitchell, Overland; F. H. Edwards, Maxwell; Sprague & Haynes, Cadillac; Gould Automobile Co., Buick.

Electric vehicles: H. H. Babcock Co., Babcock.

Accessories: Panhard Oil Co., Monogram Oil Co., Standard Oil Co., People's Oil & Fuel Co., Garland Automobile Sales Co., Clinton Vulcanizing Works, Potter Co., Vacuum Oil Co., W. W. Conde Hardware Co., E. L. Williams Co., George A. Lance.

Every available inch of space taken, Elmira, N. Y., this week is in raptures over its first automobile show which is being held in the state armory, promoted by the local Chamber of Commerce. Thirty makes of car are exhibited, all but one being shown by local dealers, while the E. R. Thomas Motor Co., of Buffalo, has taken space for its products and has on exhibition the battle scarred New York-Paris car and the trophy, which receives no end of attention. Vieing with it for notice is a Curtiss aero-

## FOUR SYSTEMS OF MOTOR HAULAGE

Expert Defines Them and Remarks the Real Question Involved—Hiring with an Ulterior Motive.

To the manufacturer or merchant who is debating the question of undertaking the installation of a system of motor haulage for his wares, a question of secondary moment, which presently swells to primary importance, is that of maintenance. Having decided to make use of the commercial automobile, and having taken up the problem in characteristic analytical fashion, he first settles in a general way upon the type or general character of the vehicles he will use. Thereafter, supposing he is not inextricably involved in the toils of some wily salesman, he comes upon the problem of maintenance in all its magnitude.

"Four solutions of the problem are open to the average user who goes about the matter in an open-minded and voluntary way," said an expert in discussing the situation. "The first and most natural course is to buy the machines outright, taking as many as he figures he can use, and generally one or more in addition to provide substitutes for layovers, and to take care of rush work. Having purchased the equipment, he may then arrange for garage facilities, install his own repair shop, lay in a stock of parts, hire a foreman and as much of a crew as may be required and thus put himself upon an independent basis.

"The second method open to him is to buy the vehicles, but to have all repair work carried out under some form of maintenance contract, such, for example, as a number of the commercial vehicle makers are ready to undertake. Another method, a variation of this, is to buy the vehicles, but contract for their entire operating and maintenance expense on a monthly or yearly basis.

"The fourth method of handling the problem is to expend nothing in downright purchase of equipment, but to hire the vehicles by the month or year, paying a contractor for the service at rates based on mileage covered, or on any other basis which may be agreed upon. This method, I may say, is one which is being followed by a large number of the great department stores in the larger cities, which are more anxious to secure regular service than to attempt rigid economies by expending some capital and venturing into an unfamiliar line of management.

"It is, you see, merely a question of dividing the business of vehicle upkeep, maintenance and operation, and, to a certain extent, of competition along those lines. The prospective operator must decide whether by purchasing his equipment and running it entirely himself, he can reduce his car mileage or ton mileage costs to a lower

price than that for which he could buy the service from a specialist; or, whether it would be to his advantage to invest a reasonable amount in good equipment and then operate it at a lower cost than he could have it done for under contract; or, again, supposing he owns and operates the vehicle himself, whether he can put himself in a position to compete with the repairman who is willing to undertake to keep his machines in running order, for a price. Of course, in the latter case, something depends on whether he is going to hire out the repair work or actually attend to it in his own shop.

"Supposing then, that the merchant or manufacturer, or whoever he may be, has already decided that by patience, perseverance, good management and experience, it is possible to treble the work of a given number of horse-drawn wagons merely by substituting an up-to-date motor equipment, the problem of administering such an equipment, reduces to a not too difficult question of pure business. He is subject to mechanical experience and local facilities to some extent, he is very largely in the power of circumstances in the way of highway conditions, length of hauls, number of stops per trip or per load-mile and uniformity or 'lumpiness' in the volume of merchandise to be transported. But the real question is as to the amount of capital he is willing or able to concentrate on the transportation problem and the thoroughness with which he is disposed to go into the handling of the work.

"As I said before, the natural thing to do, is to buy the cars outright and attend to all the details of their care and running. The most attractive proposition to many users who are overburdened with other work or are timid as to the outcome, is to shift the responsibility on the willing shoulders of some contractor and pay the contractor the living wages and profit which he has a right to demand. Maintenance and operation contracts and simple repair contracts, represent intermediaries between the two extremes.

"And I might as well add," he concluded with a shrewd smile, "that more than one commercial vehicle user has adopted the policy of hiring the machines on an operating basis with an ulterior motive. He pays the contractor a good price and in return a stated number of vehicles back up to his platform every day and haul away his stuff. The contractor owns the machines, pays the drivers, settles the fuel and oil bills, handles the repair problem, looks out for insurance, liabilities and damage claims, and replaces every broken-down car with a fresh one. But in the meantime the man whose goods he is hauling is watching him and keeping pretty close tabs on his operations with the idea that just as soon as he has learned the ins and outs of the business, he himself can venture a little investment on his own account and not only scale off the contractor's profit, but save money besides."

plane, which is suspended from the ceiling. Draped with flags and the aisles defined by rows of potted plants the hall presents a pretty appearance. Motorcycles and accessories also are much in evidence. An innovation in show routine will be introduced on Thursday (today), society night, when the exhibition will remain open until 11 p. m., and dancing will take place.

Those who are exhibiting are as follows:

Gasolene cars—Southern Tier Motor Co., Overland, Marion, Oldsmobile, Courier; Corning Automobile Co., Pierce-Arrow; Roberts & Son, Rambler, Krit, Grabowsky; Chenango Motor Sales Co., Speedwell; L. D. Woodward, Ford; R. C. Pierce, E-M-F., Flanders; H. K. Spaulding, Haynes; John Rhodes, Jackson, Fuller; Oliver Eisenhart, Winton; La France Motor Car Co., Hudson, Chalmers, Reo, La France; International Harvester Co., International; Charles F. Bishop Co., Buick; Frank Record, White; Elmira Motor Car & Machine Co., Maxwell, Franklin, Empire; Corning Automobile Exchange, Peerless; H. E. Richardson, Oakland, Rapid; E. R. Thomas Motor Co., Thomas.

Motorcycles—P. B. Rutan, Indian, Thor, Excelsior; Elmira Arms Co., Pierce.

Accessories—C. A. Georgia, H. H. Hallock & Bros., J. Mont Tillman, Frederick Tomlinson, Swan & Sons, S. F. Izzard & Co., John Frey, Perry, Sly & Ayers, Carroll C. Keeton, Charles M. Watkins, Standard Oil Co., Clay W. Holmes.

### Babbitt's Failure to Grasp Full Value.

As illustrating the occasional inability of inventors to appreciate the real element of value in their ideas, it is noteworthy that the original patent specifications drawn up by Isaac Babbitt, inventor of the metal which bears his name, concerned merely the method of holding the soft alloy in place in journal boxes, and not the composition itself. His first venture, "Britannia ware," was not a commercial success. Six years after his failure to introduce it, or in 1830, he produced the bearing metal from which he afterward derived fame and a substantial fortune.

### One Evil of Over-Lubrication.

Despite the fact that many drivers appear to consider it "smart" to over-lubricate their engines to the extent of causing them to smoke voluminously, the practice is not to be encouraged, and for more reasons than one. Among other difficulties which it breeds, is the clogging of the muffler with particles of half-burned carbon and oil.

### Usefulness of the Babbitt Hammer.

A very useful tool which seldom is included in the stock equipment of a car, is a copper or babbitt hammer. It serves a useful purpose in removing finished parts which are too firmly set in place, and always should be used on such work in preference to the regular machinists' hammer because it will not dent or mar the metal.

THE NEW  
**Rambler**

**T**HE New Fifty-Three Rambler Roadster is the latest addition to the Rambler line. Its pleasing lines and features, providing unusual comfort, combined with the power, silence and quality of the Fifty-Three touring car, has gained for this model immediate distinction.

The distance from dash to seats is thirty inches. This length, the tilted seats, the rake of the steering column, combines to provide the most comfortable and graceful position for the operator.

Motor: 34 H. P.

Bore and Stroke:  $4\frac{1}{2} \times 4\frac{1}{2}$  in.

Wheel Base: 109 in.

Wheels and Tires:  $36 \times 3\frac{1}{2}$  in. Hartford Dunlop.

Guards: Convex front and rear.

Body: Two passengers, low seats.

Color: Dark Brewster green, cream wheels.

Equipment: Magneto and dry cells, oil side and tail lamps, gas head-lights and generator, horn, trunk with two suit cases, full set of tools and jack.

Price: \$1,800. Top with side curtains \$75. Wind-shield \$40.

**Thomas B. Jeffery & Company**

Branches: Chicago, Milwaukee, Boston, Cleveland, San Francisco

**"Two Years Ahead"**

# THE 1911 OWEN

## **Designed for Touring Comfort—Fully Equipped**

Present tendencies strongly mark the coming popularity of Owen features.

### **Left Hand Drive**

The logical place for the steering gear in any country where the law of the road is "keep to the right," and where city ordinances compel vehicles to stop on the right side of the street.

### **Right Hand Gear Control**

With all levers within the body this makes the operation simple and with nothing new to learn. It permits of easy access to front seat from either right or left side.

### **42 Inch Wheels**

The history of automobile building has been toward large wheels. They make easy riding easier; reduce jolts and jars and make boulevards out of ordinary country roads.

### **Triple Tire Mileage**

It is nothing unusual to get 15,000 miles from an Owen 42x4 tire.

### **Long Stroke Motor—6 Inoh**

This stands for elimination of vibration, long life of all working parts, economy of gasoline and oil, great torque or pulling power at slow speed, wonderful hill climbing, throttling down ability. The Owen motor is four cylinder, 4¾x6, 50 H.P.

### **High Front Door Body**

The advanced type of touring body—it protects the front seat passengers and adds a classy style. The Owen body is of straight line design with roomy tonneau and auxiliary seats.

### **Full Touring Equipment**

This is the way all motor cars will be sold in the future. The 1911 Owen is regularly equipped with every touring necessity—finest quality mohair top, folding wind shield, speedometer, clock, electric horn, electric and gas head lights, electric and oil side and tail lights, Prest-O-Lite tank, luggage rack, tire carrier irons, coat rail, foot rest, muffler cut-out, foot accelerator, tire chains, one extra inner tube and a full set of tools.

**Price \$4000 F. O. B. Detroit**

Dealers wishing details relative to agency arrangements should write us at once.

Model L Touring Car

# The HENRY 35

**Built to Sell on Its Merits at \$1750**

WE realized in building this car that the competition on cars selling from \$1250 to \$2000 is very great and that the only possible way to capture the trade was to produce a car that would offer the purchaser better value and the dealer a bigger sales making opportunity than any other machine in this class. It took some time to figure out just how to do this—though the men composing our organization had long experience in motor car building.

But we did it, and here is the car acknowledged by experts to be the best car for less than \$2500 on the market. The Henry was a success from the start because in addition to speed, ease of control, dependability and comfort it has a style that is as a rule found only in the high-priced machines.

Dealers should get our unusually attractive proposition on this wonderful car. Mail postal today for catalog and full particulars.

**HENRY MOTOR CAR COMPANY, Station B, Muskegon, Michigan**

Model D Demi Tonneau

## SPECIFICATIONS

**BODY**—Standard Touring Straight Line. Seating Capacity, five.

**MOTOR**—Four Cylinders. H.P., 35-40. Bore, 4 1/8. Stroke, 5 1/4. Cylinder "L" head, cast in pairs. Valve location, all on one side. Cycle, four.

**LUBRICATION**—System, circulating inside pump. Vertical shaft, spiral driven. Pressure feed to crank case.

**COOLING**—Water cooled, centrifugal pump. Radiator, tubular. Fan, attached to engine, belt driven.

**IGNITION**—Jump spark. System, dual. Magneto and dry cells. Splitdorf magneto. Control, hand lever on wheel.

**CARBURATION**—Carburetor, special. Fuel feed, gravity.

**CLUTCH**—Type, multiple disc. Friction surfaces, steel to steel.

**GEARSET**—Selective, located amidship. Three speeds forward.

**TRANSMISSION SYSTEM**—Shaft drive through torsion tube. Rear Axle, full floating.

**BEARINGS**—Crankshaft, three large, plain. Camshaft, three plain. Clutch, spindle, plain. Clutch, thrust, ball. Gearset, F. & S. ball. Rear axle, F. & S. ball. Front wheels, ball. Steering knuckle, plain. Steering gear, ball thrust. Plain bearings. Parson's white brass.

**RUNNING GEAR, ETC.**—Wheelbase, 116 inches; tread, 56. Wheels, 10 spokes front, 12 rear. Tires, front and rear, 34x4; Firestone, Continental or Michelin. Front springs, semi-elliptic. Rear springs, three-quarter scroll. Front axle, pressed steel, box type. Brakes, expanding, service and emergency; internal on rear wheel. Frame, pressed steel. Equipment, 5 lamps, tools and generator, jack and repair kit. Top extra. Control, hand levers on steering wheel and foot accelerator. All cars iron for top.

## RECENT PATENTS.

948,689. Elastic Suspension for Vehicles. Lorenzo Basso, Genoa, Italy. Filed March 5, 1909. Serial No. 481,530.

1. An elastic suspension for vehicles comprising in combination with the axle and frame, an annular support concentrically mounted on the axle, an annular yielding member mounted on said support, inner and outer band surrounding said member, springs connected to the ends of the outer band at points on diametrically opposite sides of said member, and connections between said springs and the frame of the vehicle.

948,800. Automobile Steering Mechanism. Robert Symmonds, Jr., Kenosha, Wis., assignor to Thomas B. Jeffery, Wis. Filed Aug. 2, 1906. Serial No. 328,872.

1. In a steering mechanism for automobiles the combination with a steering shaft, of a casing into which the lower end of said shaft extends, means for securing said casing to the automobile frame, a tube mounted upon said casing, and surrounding said shaft, a ring carried by the upper end of said tube, a circular flange fixed to said shaft and underlying said ring, a hand wheel fixed to said shaft above and engaging said ring, and means located within said casing engaging said shaft whereby a rotary movement of the shaft will be communicated to the steering wheels of the automobile.

948,813. Removable Wheel Rim. John C. Cole, Chicopee Falls, Mass., assignor to Fisk Rubber Company, Chicopee Falls, Mass., a Corporation. Filed March 1, 1907. Serial No. 359,967.

1. A wheel comprising a metal rim permanently secured to the felly and having one of its edges beveled, a tire rim fitting loosely over the fixed rim and overhanging the beveled portion thereof, an expansible and self contracting ring whose normal external diameter is less than the interior diameter of said tire rim, interposed between the fixed rim and tire rim, said ring having a beveled under surface parallel with the beveled edge of the fixed rim, and an upper surface parallel with the inner surface of the removable rim, and means to move said ring against the beveled surface on the fixed rim to expand the ring radially to a greater diameter than its normal condition, thereby forcing the same into binding contact with the removable rim to lock the latter to the wheel.

948,978. Wheel. Ralph R. Sandham, Harlan, Iowa, assignor, by mesne assignments, of one-half to Josiah D. Sandham, Omaha, Neb. Filed July 18, 1907. Serial No. 384,330.

1. In a wheel, the combination with a rim carrying laterally spaced inwardly extending members, of a tread section comprising complementary sides and a tread proper spaced from the rim, the sides being provided each with an annular opening to receive the corresponding rim member, and a pneumatic tube interposed between the rim and tread.

948,998. Wheel. Maurice Lachman, New York, N. Y., assignor to Welded Steel Company, New York, N. Y., a Corporation of New York. Filed April 30, 1909. Serial No. 493,107.

1. A metal wheel composed of a hub, a rim, and spokes connecting said hub and rim, said sub being composed of two tubu-

lar members on which is placed a sleeve by which said members are connected, said tubular members being provided at their outer ends with integral spokes the outer ends of which are secured to the rim, the inner ends of said spokes being enclosed by annular discs or washers which are secured thereto and to each other and to the hub members.

949,000. Distance and Speed Indicator and Recorder. George S. Maxwell, Washington, D. C. Filed Sept. 17, 1908. Serial No. 453,537.

1. The combination, with clock mechanism to feed a record sheet forward at a uniform speed, of a recording pencil mounted to move transversely of the record sheet movement, a drive shaft, an eccentric driven by said shaft and arranged to rotate once for a given number of rotations of the drive shaft, a transmission member having one end adjustably connected with the pencil and the other end engaged by the eccentric and yielding means to hold the pencil against the record sheet and the end of the transmission member in engagement with the eccentric to prevent any lost motion and to produce a continuous accurate record on the sheet.

949,060. Vehicle Tire. William J. Courtney, New York, N. Y. Filed Nov. 23, 1908. Serial No. 463,964.

In a resilient tire, a main body part, a tread of elastic material secured to said body part comprising an integral base and a comparatively thick exposed crown, said crown having comparatively deep intersecting grooves to form spurs in its face, layers of fabric incorporated in the base of the tread, a rubber diaphragm interposed between the body part and the tread, studs passing through said spurs and the laminated base of the tread, enlarged heads on the outer ends of the studs embedded in said spurs, and enlarged bases on the inner ends of said studs interposed between said diaphragm and the inner face of the tread.

949,112. Vehicle Spring. Dorr R. Close, Chicago, Ill. Filed Feb. 25, 1907. Serial No. 359,043. Renewed April 12, 1909. Serial No. 489,523.

1. The combination with a vehicle running gear member, and a frame member, of a leaf spring structure connected with the running gear member, having an uninterrupted leaf at its extremity curled back upon itself, and a coiled spring interposed within the curled portion between the extremity of the curl of the leaf spring and the vehicle body.

949,129. Engine Indicating Apparatus. Frederick Purdy, Kenosha, Wis., assignor of one-half to Foree Bain, La Grange, Ill. Filed Jan. 19, 1909. Serial No. 473,142.

1. In an engine indicator, the combination of a receptive surface and an applicator for directing a tracing medium upon said surface, one mounted for rotation relative to the other to produce a circular indication by the tracing medium, and one mounted for movement to produce radial displacement of the indicating trace, and pressure responsive means for effecting such movements of the appropriate element to produce the radial displacement.

949,156. Reinforcement for Pneumatic Tires and Method of Forming Same. Charles F. Murray, Detroit, Mich. Filed July 2, 1908. Serial No. 441,655.

1. The herein described method of re-

inforcing pneumatic tires, consisting of injecting within the pneumatic tube elastic fluid material, then inflating the partially filled tire, rotating the tire to distribute the fluid material over the inner surface of the tread section, and heating the tire while rotating to solidify the fluid material.

949,179. Driving Axle. Royal H. Gilbert, Lakewood, Ohio. Filed April 8, 1907. Serial No. 366,957.

1. In a motor vehicle, in combination, a driving member, driving wheels, an axle co-operating with said wheels, forward and reverse coupling devices between said axle and each of the driving wheels whereby the latter may be driven by the former in either direction, and a plurality of cams between said driving member and said axle for bringing about the coupling of the latter to the wheels.

949,190. Appliance for Preventing Side Slipping of Wheels on Motor Vehicles. Alfred A. Mansell, London, and George Smith, Chelsea, London, England. Filed March 30, 1908. Serial No. 424,104.

1. The combination with a wheel of a vehicle, of a separate strip of material, means for supporting said strip at its two ends so that the middle is near the ground, transverse strips, and means securing said transverse strips at right angles to the suspended strip in close proximity to the wheel.

949,229. Device for Supporting Shaft-Hangers. Emil Gruenfeldt, Cleveland, O., assignor to The Baker Motor Vehicle Company, Cleveland, Ohio, a Corporation of Ohio. Filed Nov. 15, 1907. Serial No. 402,330.

1. In mechanism of the class described, the combination with a motor vehicle frame; of a shaft hanger comprising a part fixedly secured to the frame, together with a second part removably suspended from said fixedly secured part, and having a horizontal axis of oscillation; said second part being further formed with a lower portion provided with a hollow sleeve split on its under side and adapted to receive and support a shaft housing whose axis is transverse with respect to the axis of oscillation; a shaft housing in said sleeve; bolts through said lower portion to fixedly secure said shaft housing within said sleeve.

949,246. Vehicle Brake. Herbert E. Penney, Minneapolis, Minn., assignor to Nott Fire Engine Company, Minneapolis, Minn., a Corporation. Filed June 17, 1909. Serial No. 502,660.

1. In a brake, the combination with a hub having a clamping plate at its inner side, of a casing member secured thereto, a second casing member connected thereto and forming in conjunction therewith an annular chamber, a socket provided on the latter member, a fixed horizontal pin engaging loosely in the socket to allow horizontal but prevent rotary movement of the casing member, an expansion ring supported in the chamber by the stationary casing member, an expander for spreading the ring to frictional contact with the rotating casing member, and brake lever devices for actuating the expander, substantially as set forth.

949,308. Vehicle Spring. William I. Smith and Jacob H. Klassen, Los Angeles, Cal. Filed June 25, 1908. Serial No. 440,266.

1. A vehicle spring construction, comprising in combination with a spring, an

axle bearing, said bearing being provided on its upper face with a raised block, said spring being bent and fitting over the raised block, and securing means for the spring on each side of the best portion.

949,422. Automobile. John E. Gable, Evanston, Ill. Filed July 27, 1908. Serial No. 445,459.

In an automobile the frame and a front and rear tubular axle fixed thereto, in combination with a tubular wheel spindle arranged at the outer ends of each of said axles, knuckle joints connecting said spindles to said axles, wheels mounted on said spindles, a drive shaft arranged in each of said axles, a short shaft arranged in each of said spindles and connected to the wheels, universal joints connecting each of said drive shafts with the respective short shafts, a brake housing on each of said spindles upon its respective spindle portion of the knuckle joint, a pair of arms rigidly fixed to each of said housings, one of said arms extending inwardly and the other parallel with its respective wheel, a rod connecting the inwardly extending arm of each front wheel with the inwardly extending arm of the rear wheel on the opposite side, drag links connecting the parallel arms of the front wheels, and the parallel arms of the rear wheels, a steering rod connected to one of said inwardly extending arms, a centrally pivoted draw lever at the forward end of said frame, said lever having an eye at its forward end and provided with a fork at its rear end whereby it is secured to the forward drag link, substantially as described.

949,433. Automobile Signal, James T. Johnson, Memphis, Tenn. Filed Dec. 19, 1908. Serial No. 468,401.

1. A device of the class described, comprising a signal, a compressed fluid storage tank, a valve casing provided with inlet ports and an outlet port, a tubular passage between said tank and inlet ports and between said outlet port and signal, an auxiliary casing smaller than and positioned within said valve casing, aligning ports through said auxiliary casing and one of said ports in communication with one of said inlet ports, a movable valve member within said casing and a finger projection carried thereby and closely fitting said auxiliary casing, said projection having a transverse port therethrough and the valve casing having an exhaust port, said valve member provided with a transverse port adapted to make and break communication between the other inlet and the outlet port.

949,503. Headlight. Henry L. Schuler, Cleveland, Ohio. Filed March 8, 1909. Serial No. 481,921.

1. The combination with a source of light, and a mirror, of a diaphanous pane having a portion provided with a series of horizontal ribs with inclined faces, said ribs extending continuously from one side of the pane to the other and increasing in angular divergence from the central portion upwardly, the rib-provided portion of the pane extending downwardly at least as far as the source of light.

949,634. Combined Magneto Electric Generator and Engine. Frank I. Remy and Benjamin I. Remy, Anderson, Ind., assignors to Remy Electric Company, Anderson, Ind., a Corporation. Filed March 22, 1909. Serial No. 484,875.

1. The combination of a combustion engine having a crank shaft with an opening into the same, a magneto electric generator provided with a base plate adapted

to removably close said opening in the crank shaft case, and a driving connection between the parts of the engine and magneto that is in operative condition when the magneto is secured in place on the crank shaft case.

949,654. Shock Absorber. William B. Knapp, Stoneham, Mass. Filed June 10, 1909. Serial No. 501,317.

1. A shock absorber comprising a cylinder and a piston contained therein having holes through it and having valves, and a movable closing plate arranged in said cylinder, in the downward path of movement of the piston, for closing one or more of the holes therein, whereby further downward movement of the piston is restrained, substantially as described.

949,704. Attachment Plug for Engine Cylinders. Nevil M. Hopkins, Washington, D. C., assignor to The Electric Speedometer and Dynamometer Manufacturing Company, Washington, D. C., a Corporation of Delaware. Filed June 23, 1909. Serial No. 503,779.

1. A spark plug comprising an insulating bushing, an electrode wire passing therethrough, said bushing having an opening therethrough of different diameters, a packing between the thus formed shoulders on the bushing and tube, and a spring for holding the parts in place.

949,746. Tachometer and Odometer. Neville M. Hopkins, Washington, D. C., assignor to The Electric Speedometer and Dynamometer Manufacturing Company, Washington, D. C., a Corporation of Delaware. Filed March 24, 1909. Serial No. 485,470.

1. In a tachometer consisting of a direct current magneto having a commutator and an electric meter in circuit therewith, the combination with the magneto of a substantially water and dust proof case therefor, a shaft extending through said case and adapted to be driven at high speed, and reduction gears in said case between said shaft and the magneto commutator shaft.

949,833. Shock Absorber. Robert G. Mueller, Yonkers, N. Y., assignor of one-half to Frederick Geh, New York, N. Y. Filed May 1, 1907. Serial No. 371,220.

1. The combination of two members one movable relatively to the other, and a shock absorber comprising a cylinder secured with the other member by a universal joint, and a piston connected with the piston rod and fitted into said cylinder, the piston having a solid face at the end adjacent to the cylinder head.

949,846. Automobile Lamp. Charles J. Schmalzried, Knoxville, Pa. Filed Jan. 14, 1909. Serial No. 472,360.

1. In an automobile lamp, the combination of a swiveled lamp body, connections between said lamp body and the steering gear, and a gas burner extending up within said lamp body and supported independently thereof whereby the burner remains stationary.

949,858. Controlling Device for Internal Combustion Engines. George C. Sweet, Waterloo, and Carl W. Weiss, New York, N. Y. Filed Jan. 22, 1909. Serial No. 473,627.

1. Controlling mechanism for internal combustion engines, comprising an air valve to supply or cut off air only to or from the

**There  
is only one  
real auto trunk**

Only one that can and does meet every requirement of the motorist, The KAMLEE—built by trunk-makers who are motorists, touring motorists, and who know from actual experiences what features are necessary in a practical, serviceable and convenient auto trunk.

## The KAMLEE Auto Trunk

is strong—built of 3-ply bass wood, not of pulp composition—and without question the most durable auto trunk made. Is lined with genuine Irish linen and covered with heavy enameled duck, making it absolutely

### Dust Proof—Rain Proof

Has a patent drop front which enables you to remove articles from the bottom without disturbing the top, and without taking the trunk from the car. May be removed from car and shipped as baggage with no danger of damage.

engine for starting or reversing and independent of means for supplying air to the engine as an element of the explosive mixture, a fuel valve independent of the air valve to supply or cut off fuel directly to or from the engine, and means whereby one of said valves is operated automatically through the movement of the other of said valves.

949,888. Rubber Tire for Vehicles. Richard J. Evans, Franklin, Pa. Filed May 27, 1908. Serial No. 435,232.

1. A hollow tire composed of vulcanized rubber and superposed layers of woven as-

bestos cloth incorporated with the rubber during the vulcanizing operation.

950,172. Tire Repair. Device. John C. Herman, Chicago, Ill. Filed Dec. 14, 1908. Serial No. 467,364.

1. As a new article of manufacture, a tire repair device consisting of a shoe adapted to conform in shape to a section of the tire, the said shoe being formed of a plurality of superposed layers of rubber fabric secured together and gradually increasing in size from the outermost to the innermost layer, and means for securing the shoe to the inner face of an outer tire.

## **PUSHES DECREE AND FILES SUITS**

**Licensed Association Busy in Federal Courts in New York and Detroit—Action Against Eleven Makers.**

On Monday of this week Judge Hough, of the United States Circuit Court for the Southern District of New York, held a hearing in New York, at which the Ford attorneys and those for the Licensed Association presented their arguments concerning the entering of the decree in the Selden case, with the name of the Columbia Motor Car Co. substituted for that of the Electric Vehicle Co., as a joint complainant with George B. Selden. The delay in the entering of the decree, following the sustaining of the patent last fall by Judge Hough, has been due to the disinclination of the Ford attorneys to acquiesce in the substitution of the Columbia name.

In presenting the Ford side, Attorney Edmund Wetmore stated the situation and its legal aspects in such a way as to convince the lay visitor that neither George B. Selden nor the Electric Vehicle Co., nor the Columbia Motor Car Co. has any valid legal interest in the Selden patent which would entitle them to a successful complainant's rights in prosecution. Frederick P. Fish, appearing for the complainants, presented the matter in an entirely different light, however, and the hearing lasted so long that Judge Hough finally terminated it and asked the two sides to file their briefs and exhibits within two days, that he might go over them before giving his decision as to whether the Columbia name properly may be substituted without the filing of an original bill and other legal red tape. Henry Ford, George B. Selden and others prominent in the controversy, were present during the day.

Actual filing of suits against automobile manufacturers not licensed under the Selden patent, since the decision sustaining

the patent, commenced in Detroit on the 15th inst. with a list of ten Michigan companies. While it was known that at least five of them were marked for infringement prosecution, the list was larger than had been anticipated. The complainants in each of the suits are George B. Selden and the Columbia Motor Car Co., although in a practical sense it is the Association of Licensed Automobile Manufacturers that is prosecuting.

The list of defendants in the Detroit cases is as follows: Paige-Detroit Motor Car Co., Anhut Motor Car Co., Warren-Detroit Motor Car Co., Carhartt Automobile Corporation, Abbott-Detroit Motor Car Co., Owen Motor Car Co., Demotcar Co., all of Detroit; W. A. Patterson Co., Flint Wagon Works, both of Flint, and the Imperial Motor Car Co., located in Jackson, Mich.

In the advance hints as to the bringing of the suits against "independents," it had been indicated that the Parry Auto Co., of Indianapolis, Ind., and the Velie Motor Vehicle Co., of Moline, Ill., likewise were to be made defendants in actions for infringement. Suit has been filed against the Parry company, but that against the Velie apparently is still in preparation.

### **Grabowsky with United States Motor.**

Morris Grabowsky, who was one of the founders of the Rapid Motor Vehicle Co., of Pontiac, Mich., but who recently resigned his connection with that enterprise, has been given the management of the commercial vehicle division of the United States Motor Co. The latter has the Alden-Sampson plant at Pittsfield, Mass., as the nucleus for commercial vehicle plans of considerable magnitude.

### **Owen Becomes Reo Vice-President.**

Raymond M. Owen has been elected to the vice-presidency and directorate of the Reo Motor Car Co., of Lansing, Mich., for which company he has marketed the output since 1904. A large interest in the company recently was acquired by Owen from R. Shettler, the retiring vice-president.

## **SUES A. L. A. M. FOR \$500,000**

**Velie Institutes an Attack in Milwaukee, with Licensed Members as Defendants—Alleges "Trust" Conspiracy.**

Action against the Association of Licensed Automobile Manufacturers and its members for \$500,000 damages has been brought by the Velie Motor Vehicle Co., of Moline, Ill., in the circuit court at Milwaukee, Wis., the Sherman anti-trust law being invoked to aid in the suit.

The summons and complaint were filed on Tuesday, 19th inst. The complaint alleges that many of the large automobile concerns of the country, manufacturing more than half the total annual output of cars, have formed a combination in restraint of trade under the name of the Association of Licensed Automobile Manufacturers, and that this association has conspired to put the plaintiff out of business because it would not agree to the association's terms.

It is alleged that overtures were made to the plaintiff by the association that it should become a member, and that the initiation fee be \$14,000; and also that it restrict its output of automobiles in 1910 to 2,500 and in 1911 to 2,000.

Upon the refusal to join the association, it is alleged, the defendant maliciously conspired to ruin the plaintiff's business, and to that end induced prospective purchasers of automobiles to refuse to buy the Velie car; that they induced dealers in automobiles and parts to break their contracts with the plaintiff, and that they induced advertising agents to refuse to advertise the Velie car. To accomplish this end, it is alleged, the defendants threatened the advertising agencies and others that if they should deal with the Velie company they would lose the business of the defendants.

In addition to the members of the A. L. A. M., the list of defendants includes the Kopmeier Motor Car Co., of Milwaukee,

Wis., which, after agreeing to act as the Velie agent, later declined to take the agency, on the ground that the Velie car is not licensed under the Selden patent. In fact, this incident is largely the peg on which the litigation is hung and accounts in some degree for the suit being brought in Milwaukee.

#### Schacht to Expand in Cincinnati.

The Schacht Mfg. Co., of Cincinnati, O., making Schacht motor buggies and "3-in-1" general purpose cars, has decided upon an increase of capital stock from \$100,000 to \$300,000 and has laid plans for a new factory in Cincinnati, instead of removing elsewhere as at one time contemplated. The new building will be on Spring Grove avenue, and will be 600x60 feet, three stories high. It will be of brick, concrete and steel, with the side walls consisting largely of glass, in order to provide a maximum of light. The cost of the improvement is placed at \$90,000, and arrangements have been made for private railroad switches and other special shipping facilities.

#### Detroit Dealers Choose Officers.

Officers for the coming year were elected last week by the Detroit (Mich.) Automobile Dealers Association at its annual meeting, as follows: George E. Lane, president; George D. Grant, vice-president; Robert K. Davis, secretary; John H. Brady, treasurer. The officers, with Frank Craig, will constitute the board of directors. Following a discussion it was voted to omit the annual endurance run this year, and an association run probably will be held later.

#### Troutt to Manage Van Dyke.

George A. Troutt, described as a veteran in the trade and who has been identified with a number of manufacturers, has been appointed general manager of the Van Dyke Motor Car Co., of Detroit, Mich. The concern is putting out a commercial vehicle under a fixed maintenance arrangement.

#### Marburg Moves to Larger Quarters.

Theodore H. Marburg, importer of Mea magnetos and S. R. O. ball bearings, has taken larger quarters than those occupied at 30 Wall street. The new location comprises rooms 353-357 in the Thoroughfare building, 1777 Broadway.

#### Ashtabula Has Plant Visions.

L. H. Heffner, of Cleveland, O., has indicated to Ashtabula, O., that he has selected that city as the location for an automobile plant. He proposes to organize the Heffner Motor Car Co., with \$200,000 capital.

#### Winton Enlarging Its Factory.

The Winton Motor Carriage Co., of Cleveland, O., has awarded contracts for an addition to its plant on Berea road. It will be a three-story structure, 308x70 feet.

## HEWITT CONTROLS "RECTIFIERS"

### His Patent Battle with General Electric Results in Victory—Discovery which Simplified Current Transforming.

Because of the relation of mercury arc electrical "rectifiers" to the electric vehicle field, through the fact that it is the "rectifier" which transforms alternating current into direct current so that it may be used for charging accumulators, no small importance resides in the issuance this week of two patents to Peter Cooper Hewitt, of New York, covering devices of this character and marking his ultimate triumph in establishing his patent rights, after a long and bitter battle in the Patent Office and the courts. The General Electric Co. has been his persistent opponent in his efforts to obtain basic patents on the mercury rectifier, certain vital principles of which were evolved during the development of the Hewitt mercury vapor lamp.

The patents which signify Hewitt's success in proving himself the discoverer and inventor of the mercury rectifier are No. 955,459, covering construction, and No. 955,460, the method patent. Probably the broadest and most significant of the claims is the fourth claim in the latter patent, as follows:

4. The method of obtaining a continuous flow of current in one direction from a source of alternating currents, which consists in utilizing a negative electrode reluctance for preventing the flow of current in another direction, and maintaining a condition of comparatively small reluctance at the negative electrode.

In his experiments with mercury vapor lamps, Hewitt discovered the "reluctance" of the mercury to act as a negative electrode until its surface insulating film had been punctured or the surface resistance broken down, after which it would receive current freely from the mercury vapor. His observations in connection with this phenomenon enabled him to perfect the mercury rectifier. The General Electric Co. had been quick in its development of a mercury rectifier after the appearance of Hewitt's mercury vapor lamp, and although aided by George Westinghouse, Hewitt was given a long contest in the Patent Office and later before the Circuit Court of Appeals for the District of Columbia, before he could establish his priority rights. Having been so thoroughly threshed out already, the patents do not appear likely to be subject to further attack.

#### Will Make Clark Trucks in Lansing.

Taking over Clark & Co., veteran buggy makers, and the Ferguson Motor Co., both of Lansing, Mich., a new concern has been organized in that city, with \$500,000 capital, to be known as the Clark Power Wagon Co. Frank G. Clark, who owned all the stock in Clark & Co., is president,

and will retain control in the new enterprise. R. A. Radle, of Detroit, who has been with the Rapid and Grabowsky companies, is secretary and treasurer, with B. H. Warner as general superintendent, and John Demmler as chief engineer. The factory is at Grand avenue and Washtenaw street, and will produce a 20 horsepower water cooled truck of 1,000 pounds capacity. The expected output is to be marketed by a separate corporation, styled the Radle-Clark Sales Co., with \$50,000 capital. The latter will make its headquarters in the Majestic building, Detroit.

#### Lewis Doubling Its Present Capacity.

The Lewis Spring & Axle Co., of Jackson, Mich., of which the American Distributing Co., Jackson, is the sales representative, is arranging to double its capacity for 1911. To this end the five plants of the company making springs, axles and parts, will be added to and expanded in the near future.

#### Hyatt Resigns from Columbia.

F. S. Hyatt, purchasing agent of the Columbia Motor Car Co., Hartford, Conn., has resigned, after three years connection with the company. He was tendered a farewell dinner on the 14th inst., H. W. Nuckols, vice-president, acting as toastmaster.

#### Rubber Continues at Record Prices.

Rubber has continued high for the past two weeks, the chief activity being in London. The price for plantation raw rubber of a grade almost corresponding to the best Para has several times reached the record figure of \$3.12 per pound.

#### Thomas Decides to Build Sixes Only.

Only six cylinder cars will be made by the E. R. Thomas Motor Co., of Buffalo, N. Y., for the coming year, according to an official announcement. The change in manufacturing policy will go into full effect on May 15.

#### Hartford Rubber's "K. C." Branch.

New and elegantly appointed salesrooms just have been fitted up for the Kansas City (Mo.) branch of the Hartford Rubber Works Co., at 719 East Fifteenth street. A complete line of Hartford tires will be carried.

#### Chicagoans to Sell Dart Output.

The Car Makers Selling Co., of Chicago, Ill., in addition to its other lines, has taken over the exclusive sales agency of the Dart light delivery wagon. The vehicle is of 700 pounds capacity and sells for \$650.

#### Jeffery-Dewitt Moving to Detroit.

The Jeffery-Dewitt Co., making spark plugs, will move from Newark, N. J., to Detroit, Mich., on May 1. A large factory has been equipped for the company in the latter city.

**VERBAL REPAIR CONTRACTS VALID**

**Heavy Damages Against Repair Shop as Result of Suit Brought by an Owner—The Court's Decision.**

That the owner of a repair shop is compelled not only to make repairs for a price not exceeding the sum verbally agreed upon, but also held responsible for damage or loss in case he keeps the car beyond a reasonable time for repairs, was decided in the Supreme Court of New Jersey last week. The decision is of importance to garage and repair shop owners, as it establishes a precedent which may be followed in other states.

E. B. Dunn, a manufacturer of vacuum machinery, took his automobile, valued at about \$3,000, to the Greenhalgh Engine and Machine Works, at 552 Central avenue, Newark, N. J., to be repaired. The engine people, after looking over the car said that the job would cost between \$200 and \$250, and the court held that a verbal contract was entered into to put the car in shape for this sum. When Dunn went to get the car, he was told that the bill was \$287.95. He objected to the charge, but tried the machine; he then found that it would not run at all satisfactorily, he alleges, so he returned it and the company tinkered with it further.

After several experiences of this kind, the repair people declared that they would not let the car go out again, even for testing, until they had been paid. Dunn offered to leave the decision as to whether the car had been put in good running order to a third party, an expert, with the agreement that if the expert said the machine was all right, he would pay the full amount. This proposition the repair people declined. Pending a settlement of their differences the latter held on to the car.

In the suit of replevin which Dunn instituted for the recovery of his machine, Justice Adams charged the jury that if the defendants had agreed to overhaul the car and put it in good condition for a certain amount of money and had failed to keep the contract, and refused to deliver the car, plaintiff should recover. If the jury found that the defendants had submitted a bill for a greater amount than was agreed upon, this amounted to a waiver of their lien.

The jury decided that not only should the plaintiff have his machine back, but granted him damages to the amount of \$1,032.21, which includes interest on the value of the car since its retention by the defendants. To make things still more disagreeable for the repair people, Dunn's lawyer instructed him to let them sue him for the \$250 originally agreed upon, and that if the machine now does not run all right he can have it repaired and sue the engine company for the bill, and finally, if

the car has in any way deteriorated, while held by the repair people, he can sue them for damages on that score.

**"Demonstrates" to Detroit Makers.**

A complete demonstrating shop is being installed in Detroit, Mich., by the Modern Machinery and Engineering Co., of Cleveland, O., for the purpose of making plain to automobile manufacturers the capabilities of the automatic machinery which the Modern Company offers in its capacity as western representative of the Potter & Johnston Machine Co., of Pawtucket, R. I. The company, of which Thomas F. Ahearn is general manager, hereafter will make its headquarters at 1514 Ford building, Detroit, instead of in Cleveland.

**Wabash Loses the Standard Plant.**

The plan whereby Wabash, Ind., was to win a St. Louis motor car manufacturing enterprise, the Standard Automobile Co., has fallen through. Although a number of Wabash citizens bought lots in the land sale that was devised to raise money for the company, the scheme was not entirely successful, and according to local authorities the automobile project "is considered past resurrection." A committee has been appointed to protect the interests of the subscribers to the subsidy fund.

**U. S. M. Officials on Western Trip.**

For the purpose of making a western trip of inspection, twenty officers and members of the board of directors of the United States Motor Co. left New York on the 16th inst. in a private car attached to the St. Louis Limited. The first stop scheduled is at the Maxwell-Briscoe plant in Newcastle, Ind., after which factories and branch houses in other localities will be visited.

**More Licensed Dealers Organizing.**

Organization of the Licensed dealers into associations in their respective cities has extended to Philadelphia and Baltimore, along the lines of the associations already in effect in Los Angeles, New York and Boston. Philadelphia has 35 dealers handling licensed cars and there are 24 in Baltimore.

**American Tube Adds a Factory.**

The American Tube and Stamping Co. of Bridgeport, Conn., which manufactures rims and other components for motor cars, has purchased an additional factory and ten acres of land on Hancock avenue, owned by the Bridgeport Copper Co. The factory has a floor space of 125,000 square feet.

**To Make Motors in Muskegon.**

Automobile motors are to be one of the products of the Central Machinery Co., which has commenced operations in Muskegon, Mich. The company has taken the plant formerly occupied by the Muskegon Laundry Co.

**"BUTTS IN" WITH A MORGAN YARN**

**General Motors Receives Free Publicity in Connection with United States Motor's Purchase of Columbia's Stock.**

Exchange of shares of the United States Motor Co. for those of the Columbia Motor Car Co., now in process, has been made the means for the General Motors Co. intruding into a situation whereby it obtained newspaper publicity without cost to itself and which may assist in the disposal of the beautifully engraved stock certificates which it is so ready to exchange for investors' money.

The terms on which the United States Motor Co. is buying the Columbia majority stock provide that for one share of Columbia common stock there shall be issued 1.0755 shares of United States common, in addition to which the United States company will issue certificates, countersigned by the Central Trust Co., giving holders of the Columbia stock their share of revenues under the Selden patent royalties. The time for the holders of Columbia stock to deposit and receive the new shares at the Central Trust Co. has been extended to May 1.

The disclosure of the terms was made the occasion for the appearance of a story in a number of newspapers to the effect that General Motors was somehow linked with "the Morgan interests" and pointing to a \$400,000,000 merger which might include General Motors, the Studebakers and the United States Motor Co., so that the public might receive the impression that the General Motors was graced by Morgan support. The papers that "fell for it" were even innocent enough to publish a list of General Motors "properties" and to swallow the glowing tributes to its "aggressiveness," while in some cases it was referred to as "another of the units" which it was assumed Morgan is preparing to coalesce. J. P. Morgan, Jr., who as his father's chief lieutenant, may be supposed to know the firm's affairs, has made an absolute denial of the yarn.

**Swinehart Opening a Boston Branch.**

The Swinehart Tire & Rubber Co. of Akron, O., has opened a branch in Boston at 727 Boylston street. The branch is in charge of A. J. Greene, who has been connected with the automobile trade in New England for several years. A complete stock of Swinehart pneumatic and solid tires will be obtained.

**New Home for Fisk Branch in Boston.**

The Fisk Rubber Co.'s Boston branch shortly will be housed in a new five story structure at Boylston and Fairfield streets. The company has taken a 20 years lease on the building, which is about to be erected.

**THE WEEK'S INCORPORATIONS.**

Davenport, Ia.—Klemme Automobile Co., under Iowa laws, with \$10,000 capital.

Maurice River, N. J.—More Gasolene Co., under New Jersey laws, with \$100,000 capital.

Muskegon, Mich.—Muskegon Auto Body Co., under Michigan laws, with \$10,000 capital.

New York, N. Y.—Black's Garage Co., under Delaware laws, with \$25,000 capital. Corporators—I. C. McKeever, H. W. Miller, W. P. Wainwright, New York City.

Chicago, Ill.—Knight Equipment Co., under Illinois laws, with \$2,500 capital; motor cars, etc. Corporators—W. D. Jones, Vincent Bendix, R. J. Jacker.

Kansas City, Mo.—Kansas City Real Auto Co., under Missouri laws, with \$20,000 capital. Corporators—B. C. Howard, R. E. Fair, H. R. Stewart and others.

Minneapolis, Minn.—Beek Auto Co., under Minnesota laws, with \$40,000 capital. Corporators—R. H. Beek, Lakota; Gus Lamb, John Kerwin, Michigan City.

Philadelphia, Pa.—Hess-Bright Mfg. Co., under Delaware laws, with \$1,000,000 capital. Corporators—F. R. Hansell, G. H. B. Martin, S. C. Seymour, Philadelphia.

New York, N. Y.—Eastern Auto Distributing Co., under New York laws, with \$1,200 capital. Corporators—Stephen C. Riero, Brooklyn, and others.

Hartford, Conn.—E. J. Todd Rubber Co., under Connecticut laws, with \$2,000 capital. Corporators—E. J. Todd, New Haven; A. P. Gunn, J. W. Keating, Hartford.

Tulsa, Okla.—Tulsa Auto Truck Co., under Oklahoma laws, with \$75,000 capital. Corporators—S. C. French, Marshall, Mich., and others.

Kansas City, Mo.—C. L. Taylor Motor Car Co., under Missouri laws, with \$5,000 capital. Corporators—E. N. Highley, Grace J. Taylor.

Baltimore, Md.—Maupin Motor Co., under Maryland laws, with \$8,000 capital; general automobile business. Corporators—J. S. Ditch, E. T. Boswell, F. B. Maupin, John Waters, J. M. Taylor.

Toledo, O.—Toledo Garage & Supply Co., under Ohio laws, with \$5,000 capital. Corporators—Charles A. Langdon, Alvin C. Jones, George T. Browning, F. M. Bushong, E. E. Sheppard.

Cleveland, O.—Motor Truck Service Co., under Ohio laws, with \$50,000 capital. Corporators—C. J. Whipple, W. H. Smith, John H. Price, E. C. Darust, J. E. McIntyre.

St. Louis, Mo.—Prescott Motor Co., under Missouri laws, with \$2,000 capital; general automobile business. Corporators—J. A. Prescott, W. W. Gardiner, W. W. Aubuchon.

Warren, Minn.—Warren Auto Co., under Minnesota laws, with \$20,000 capital. Cor-

porators—Nels Johnson, August Lundgren, L. M. Oleson, E. J. Johnson, R. B. Taralseth, Justice Carlson, Charles Wittenstein.

Bridgeton, N. J.—Hann Automobile Co., under New Jersey laws, with \$50,000 capital; to manufacture automobiles, etc. Corporators—H. L. Howell, C. D. Stowell, C. A. Hann.

Bronxville, N. Y.—General Garage Co., under New York laws, with \$60,000 capital; to deal in and rent and store automobiles. Corporators—A. H. Johnson, E. E. Beyer, H. A. Bemis.

Brooklyn, N. Y.—Abbott-Detroit Sales Co. of Brooklyn, under New York laws, with \$4,000 capital; to deal in automobiles, etc. Corporators—Bertrand Ettinger, William T. Sandall, Brooklyn; Albert G. Jennings, Rockaway Beach.

Brooklyn, N. Y.—Family Automobile Service Co., under New York laws, with \$1,000 capital; to manufacture and deal in motors, engines, automobiles and other vehicles. Corporators—John N. Williamson, Eliza De Mott, William G. Cooke.

New York, N. Y.—Correja Motor Car Co., under New York laws, with \$10,000 capital; to manufacture and deal in motors, repairs, etc. Corporators—J. Mora Boyle, Bronxville; James W. Boyle, X. E. Boyle, New York City.

New York, N. Y.—Apthorp Garage Co., under New York laws, with \$10,000 capital; to manufacture, deal in and rent automobiles, etc. Corporators—Samuel Marion, Roger M. Drury, William Rekersdress, New York City.

New York, N. Y.—C. W. Kelsey Mfg. Co., under New York laws, with \$250,000 capital; to deal in motor vehicles and bicycles of all kinds. Corporators—J. L. Robinson, Brooklyn; W. B. Barker, New Rochelle; W. L. Glenney, Plainfield, N. J.

New York, N. Y.—Hydro-Tele-Motor Co., under New York laws, with \$25,000 capital; to manufacture and deal in power transmission machinery. Corporators—J. W. McKay, Brooklyn; H. F. Fisher, New York City; E. E. Cole, Hoboken, N. J.

Corinth, Mo.—Pan-Chrone Press Mfg. Co., under Missouri laws, with \$100,000 capital; to manufacture printing presses and automobiles. Corporators—H. C. Moore, M. A. Candler, G. A. Hazard, L. C. Steele, H. O. Caffey, George Cox.

Newark, N. J.—Electrolytic Products Co., under New Jersey laws, with \$250,000 capital; to manufacture radiators and other automobile parts. Corporators—A. Goertz, Newark; A. Behrend, E. H. Green, New York City.

New York City, N. Y.—Protective Mfg. & Sales Co., under New York laws, with \$50,000 capital; to manufacture and deal in motors, engines, automobiles, carriages and supplies for same. Corporators—C. E. Terrell, C. A. Tilly, H. Smith.

New York, N. Y.—James L. Gibney &

Bro., under New York laws, with \$100,000 capital; to manufacture and deal in tires, rubber goods and automobile accessories. Corporators—J. L. Gibney, J. L. Gibney, Philadelphia; J. H. Fargis, New York City.

Jersey City, N. J.—Bearings Co. of America, under New Jersey laws, with \$1,000,000 capital; to manufacture bearings, balls, ball retainers, magnetos, carburetters, etc. Corporators—W. B. Greeley, J. W. Hertzler, A. L. O'Shea, E. F. Roehm, New York City; C. V. Tuthill, T. A. Henwick, Jersey City.

**Moving Day for the Chicago Trade.**

May 1 will be emigration day for several members of the Chicago motor colony. Among those who will change their present addresses is the Speedwell Motor Car Co., which handles the Speedwell and Staver-Chicago, and will take possession of its new home at 2411 Michigan avenue. With the vacating of the present Speedwell domicile at 1407 Michigan avenue, it will be occupied by H. E. Halbert, who shifts with the Grout from the west side. The Chicago Pneumatic Tool Co., another newcomer on the "row," will install its commercial vehicle branch in the old Kisselkar quarters at 1337 Michigan avenue.

**Olds Doubles Its Broadway Space.**

With the acquisition of the adjoining store, at 1653 Broadway, the Oldsmobile Co. of New York now has twice the floor space which was afforded in the original quarters at 1651. A spacious passage has been cut through the dividing wall, converting the two stores into one large showroom.

**Studebaker's New Minneapolis Home.**

Invitations soon will be sent out for the formal house warming of the new Studebaker wholesale and office building in Minneapolis, Minn., at Second avenue south, and Sixth streets. The new establishment, which is a model of its kind, will carry the entire Studebaker line of products.

**Maxwell Building in Buffalo.**

The Maxwell-Briscoe Automobile Co., Buffalo, N. Y., now located at 29 Goodrich street, is to have a new home which is in process of erection on the same thoroughfare, near Main street. It will be a three story brick structure, 50 by 60 feet, and will represent an expenditure of \$20,000.

**Twin City to Put Up a Garage.**

The Twin City Taxicab Co., Minneapolis, Minn., is preparing to erect a new garage at Eighth and Cedar streets. It will cost \$35,000.

**Increases in Capitalization.**

Detroit, Mich.—Anhut Motor Car Co., from \$150,000 to \$300,000.

Chicago, Ill.—Clark & Co., reorganized as the Clark Power Wagon Co.; capital increased from \$50,000 to \$500,000.

## IN THE RETAIL WORLD.

The Wichita (Kan.) Garage Co. now is "at home" in its new garage on North Lawrence avenue. The establishment is of the modern class.

R. R. Kimball, Omaha, Neb., is to have a new garage, to be erected on Farnam street, opposite his present establishment. The edifice will be one story, 50x120 feet, and will cost \$10,000.

The Brooke Automobile Co., Kansas City, Mo., has opened a branch sales office in Omaha, Neb., at 2318 Harney street. Lexington cars will be exploited, and Paul C. Gee, will be in charge.

The McIntyre Automobile Co., Omaha, Neb., has taken possession of its new home at 2203 Farnam street, the local "automobile row." The structure ranks with the best in the local colony.

The Maupin Motor Co., Baltimore, Md., is the style of a new firm just formed and which will introduce Klinekars to Baltimoreans. Work soon will be commenced on a garage which will cost \$25,000.

Work is going forward rapidly on the new garage being erected for the Houston (Tex.) Motor Car Co., at the corner of Preston and Caroline streets. The building is expected to be ready May 1.

The Vigo Auto & Electric Co., Terre Haute, Ind., has taken possession of a new garage just completed at 1255-57 Lafayette street. It is a concrete block structure, one story, 40x80 feet. The concern handles the Inter-State car.

E. J. Sprague and O. O. Hamilton, Wichita, Kan., who have had considerable experience in repair work, have embarked in that line for themselves. They have opened a shop in the rear of the Overland agency, 137 North Market street.

The Independent Auto Repair Co., Omaha, Neb., which still is in its infancy, is having a garage built for it on Farnam street, near Twenty-fourth. It will be a fireproof building, 66x125 feet, and will include a large repair shop.

Thirty-nine cars were burned in a fire which destroyed the Owner's Garage, Bakersfield, Cal., on the 7th, entailing a loss of \$150,000. Neglect to extinguish the pilot light of a steam car which was being washed is said to have caused the fire.

Fred A. Cornell, Los Angeles, Cal., local distributor of the Falcar, has taken new quarters at Pico and Main streets, where much additional "breathing space" is afforded. The commodious garage and repair rooms have entrances on both streets.

James T. Kennedy and R. D. Van Brunt, Buffalo, N. Y., believing that there was room for another motor car firm in the Bison City, have filled the breach and opened sales rooms at 728 Main street. They will have the territorial distribution of Regal cars.

The Buick Motor Car Co., Kansas City,

Mo., now owns its own home, having purchased the building which it occupies at the northwest corner of Admiral boulevard and McGee street. It is a three story brick structure, 95x72 feet, and changed hands for \$69,700.

The Morris Motor Car Co., Waterloo, Ia., just organized, has taken over the Peters-Rockwell Auto Co. establishment on East Fifth street, which will be operated by the new firm, of which C. A. Morris is the head. The concern has the Cadillac representation.

Two motor car dealers of Detroit, Mich., the Grant Bros. Auto Co., and the Winton branch, are to have new quarters, in a new sales and service building which will be erected on the east side of Woodward avenue, near Warren avenue. The building will be 97x230 feet.

To better serve its coast trade the Regal Motor Car Co., Detroit, Mich., has opened a branch in San Francisco, Cal., at 460 Golden Gate avenue, which will operate as the Regal Motor Sales Co. H. W. Brown, who comes from the factory will preside over the new concern.

Upon the completion of its new garage at 2012-18 Harney street, which is expected to be ready for occupancy soon, the Paxton-Mitchell Co., Omaha, Neb., will remove from its present quarters, 2318 on the same thoroughfare. The new establishment will be up-to-date in every respect.

Construction is under way on a new sales and garage building for the Powers Motor Car Co., Lawton, Okla., adjoining their present establishment on Fourth street. The structure will be two stories, with 75 feet front and will be built of concrete. E-M-F and Flanders cars constitute the lines handled.

Upon removing the filler cap of a gasoline tank on a car in Toman Bros. garage, North Warren street, Trenton, N. J., last week, Earl Adams was severely burned about the face by a mysterious explosion of gas which had accumulated in the tank. The gasoline did not take fire, nor was the tank damaged.

John Moore & Co., representing the Brush Runabout in New York City, have arranged to give the cars representation in the so-called "automobile district," as well as at the company's downtown store at 57 Warren street. For this purpose a retail establishment for the Brush has been opened at 1876 Broadway.

A pretentious sales and garage building is nearing completion for the Demack Motor Car Co., New Orleans, La., at 923-29 Lafayette street. It is two stories, 60x100 feet, built of concrete and steel, and is equipped with the latest appliances throughout. It will be the Crescent City headquarters for Knox and Detroit electric cars.

The Kissel Motor Car Co., Hartford, Wis., which heretofore has had agency

representation in Los Angeles, Cal., has decided to establish a branch in the Angel City, which will be located at 1246 South Flower street. Clyde Leppo, a factory man will be installed as manager, and the branch will supply the Southwestern and Mexican trade.

A. W. Hooknay, formerly secretary of the California Electric Garage Co., has disposed of his interests to President I. H. Stratton, and severed his connection. R. C. Holbert, formerly sales manager, has assumed the secretaryship. The company handles Columbia and Detroit electrics and maintains establishments in Los Angeles and Pasadena.

Pending the erection of a new building at Thirty-first street and Gillham road, the L. C. Motor Car Co., Kansas City, Mo., has taken temporary quarters at 3324 Main street, vacating its old premises at 3816 on the same street. The new building will be 50x108, three stories above ground and two below. Palmer-Singer and Baker electrics are handled.

Under the corporate title of the Broadway Garage & Sales Co., R. B. Edwards and H. D. Biggs, Kansas City, Mo., have "opened up" at Thirty-fourth street and Broadway boulevard, and will market Clark cars in that territory. The new firm is introducing an innovation in car selling by placing sample machines in show windows in different sections of the city.

The Auto Repair & Supply Co., Grand Rapids, Mich., is the title of a new concern just formed in the Furniture City. It has located at 882-84 Wealthy avenue and will devote itself to the construction of models for other makers, and repair work. E. J. Strong, E. L. Quackenbush and James A. Owen, comprise the firm, the latter having had considerable experience in the field.

Miller & Miller, of San Francisco, and James A. Brown, who operated vehicle establishments in Santa Rosa and Healdsburg, Cal., have amalgamated under the style The Consolidated Vehicle Co., which has been incorporated with \$75,000 capital. The new concern has added automobiles to its other vehicles and intends to open stores in several California cities and to do a jobbing business in San Francisco.

The H. E. Frederickson Automobile Co., Omaha, Neb., which suffered a \$35,000 loss by fire recently, again is doing business at the old stand, 2046 Farnam street, the sales rooms having escaped serious damage. The garage, which was destroyed, will be rebuilt and the sales rooms renovated and in the meantime temporary garage quarters will be maintained elsewhere. Although carrying \$45,000 insurance, it was discovered after the conflagration that most of the policies covered tornado loss only, and that fire protection was only \$10,000. The firm handles the Chalmers, Hudson, Thomas, Pierce-Arrow and Fritchle electric.

# The easiest-riding Car in the World

## IS THE

# WHITE STEAM CAR

The White Steam Car has many desirable qualities which are not equalled in any other type of car. At all times and under all conditions it is noiseless, absolutely free from vibration, smokeless and odorless. It is easiest on tires. It has unequalled hill-climbing ability. The engine can never be "stalled." It is by far the easiest car to control and it is, therefore, the safest car for passengers as well as for other users of the highway. Either kerosene or gasoline may be used as fuel.

The development of the White Steam Car—the perfection of details, simplification of parts, etc.—has gone on steadily from year to year. As a result, the 1910 White Steamer represents as great an advance over the steam car of a few years ago, as does the 1910 White Gasoline Car compared with gasoline cars designed several years ago.

During the last nine months—from July 1st to date—more White Steamers have been made and delivered to customers than in the corresponding period of any previous year.

---

Are you familiar with the many desirable features of the 1910 White Steam Car? A postal to us brings a copy of our catalog.

#### Surveying the First Three Months

"What is the condition of the trade?" and "What has been taking place in the last three months?" are questions that are being asked quite generally by those who like to know the current of affairs outside their individual experience. By making broad generalizations from a multitude of particulars, it is possible to indicate what has taken place and what the present conditions are.

Business has been big since the first of the year. It has been almost as big as the most violent optimists have predicted, and a cool estimate might place the volume of business actually done, at something like \$50,000,000 that the manufacturers have received for their wares in the first 90 days of 1910.

Every factory has in some degree felt the pressure of trying to produce at maximum capacity, and the parts chasers are out in full force speeding up the production of drop forge concerns and others who supply

the car makers. The compulsions of time are making night work very general, and almost every plant is considering or executing as rapid expansion as is possible.

Freight cars are exceedingly scarce, and not the least of the manufacturers' worries is the difficulty of effecting the rapid transportation of materials as well as cars. In many instances special details of chasers have been put to work on the quick transportation problem alone, in addition to which there has been an enormous expenditure in express shipments.

A temporary lull in the Southwest trade was felt as a result of lack of rain, but a subsequent plentiful supply relieved the anxiety of the agricultural districts as to the success of their forthcoming crops, with the result that telegrams, long distance telephone messages, special delivery letters and personal representatives, in addition to the regular mail, brought hurry-up orders from the Southwest agents for big quantities. The reaction from the crop scare more than made up for the previous meagerness of Southwest orders.

In most districts the spring opened early, resulting in a clamoring on the part of retail purchasers for deliveries in advance of their specified dates. The early rush of business also caught the tire companies some two or three weeks sooner than they had calculated on. Hardly a tire factory can be found which is not working to capacity both night and day. It also is common for all manufactured tire stock to be moved from the factory toward final distribution within 48 hours after its completion and inspection approval.

Accessory business has been flourishing. Manufacturers and jobbers are under much the same sort of pressure for prompt deliveries that prevails in the car making field, and the business is bringing a rich harvest to the big quantity producers.

Considerable significance attaches to the increasing number of orders which the parts makers are receiving on specifications for commercial vehicles. Many car makers who heretofore have not been identified with commercial vehicle manufacture give evidence of an interest in this field by modest orders for parts for such machines.

Already there is a rounding up and preparation to commence making cars for what is termed "1911" business. Such changes as are to be introduced in the models will be incorporated in new lots of cars which are to be started in May or

June. Staggering profits swell the coffers of the more prominent makers, and all the established concerns in the trade are making money now if at any time. A certain cautious feeling prevails as to future expansions, but no halting or hesitating in this general direction is manifest, though its rapidity is moderated by good sense.

#### Second Hand Cars and Their Market.

What has become of all the old cars, that ever fruitful topic for speculation, furnishes less real cause for thought than the corresponding inquiry as to what is likely to become of the discarded machines of the future. What is the present state of the relics of former years of automobile production may be considered as of trifling significance as compared with a very real issue in the problem surrounding the disposal of the second-hand products of today and tomorrow. This problem is accentuated not a little by the rapid increase in the quantity of cars produced and the lack of any indications that the rate of increase is likely to diminish during the next two or three years.

It is important to bear in mind that the trade in used cars has assumed far different proportions from those which ordinarily rule in the marketing of property which has passed the stage of first ownership. Many well-established branch stores maintain carefully conducted used car departments, in which vehicles are offered for sale only after being subjected to a thorough overhauling and put in practically as good condition as on the day they first left the factory. They are priced on a rational basis which allows for a fair margin of profit on the investment over refitting expenditures, and in many cases offer the purchaser nearly the same value as a new car, but at a very moderate figure.

Outside this second-hand business of the first order, as it may be termed, there are the two lower branches of the market; that conducted by wholesale operators who maintain large repair establishments, handle a wide range of products and cover almost unlimited territory, and the more limited enterprises conducted by smaller second-hand dealers and regularly established garagemen. In general, only the used cars obtained from branch houses and agencies which make a specialty of refurbishing their own returned products are to be accepted without question as to their actual market value. Establishments which specialize

either to overcharge or deceive the purchaser fortunately are the exception rather than the rule.

The fact that the outlet for used cars lacks organization and established procedure, both in respect to method of administration and definite segregation from the market for new cars is bound to react more or less unfavorably upon the manufacturer and dealer as time goes on. At present, probably not more than 20 per cent. of the new cars sold go to buyers who are new owners. The remainder of the buying class is made up of those who are adding to their equipment or are replacing one or more cars with new ones. What percentage of new sales actually represents augmentation to the second-hand market, and how the actual turnover of used cars compares with movement in new stock, it is impossible to tell even at the present time; what is destined to be the relative turnover in old and new cars in the future is equally impossible to predict.

It has been suggested that the business of refitting used cars properly should go to the carriage makers; many garage men and local dealers see present possibilities in it; and there are the ever-ready specialists whom nature has endowed with the ability to turn a profit out of anything which presents opportunities to buy and sell. The business in second-hand cars has all the characteristics and potentialities of a stable and more or less successful industry. Its present unacknowledged power and unknown strength as an element to be reckoned with by the manufacturing end of the automobile, however, lends it certain rather disquieting aspects.

#### Seeking Experienced Chauffeurs.

Of the many angles which the chauffeur problem presents, one which is of extreme interest to many motorists at this time of year, is as to the most direct and satisfactory method of securing a suitable candidate. As for applicants, almost anyone who has a decent "berth" to offer, finds himself flooded with applicants as soon as he chooses to make known his wants. But it is by no means an easy matter to make selection with any degree of assurance that the man chosen has had the necessary training and experience. Sometimes, it may be added, ample experience is guaranteed, but a certain reserve on the part of the candidate when questioned, leads to the suspicion that not all of his experience has been

of the sort which will tend to enhance his value to the owner who desires to preserve his car for a decent length of time.

Various organizations of professional drivers are wont to promise many things in the way of filling such vacancies, though it is not always possible to choose from their offerings men who are willing to work for the moderate wage which the average owner feels justified under the circumstances. Chauffeurs' schools, correspondence and otherwise, are very much in evidence at all times, but their neophytes are not always accepted with absolute confidence.

Such being the case, it would seem that the taximeter cab might offer ample resources as a training medium, both in manipulation and the exercise of such economy in operation as is bred of the desire to increase wages by reducing the expenditures which the average cab operator demands in the way of fines, and deductions for fuel and supplies used. Saving that they are not taught the arts of cleanliness and coachmen's etiquette, cab drivers of experience ought to make pretty good private chauffeurs, it would seem. Many of them, doubtless would gladly forsake the daily grind of answering "calls" for the more varied and supposedly less exacting duties incident upon "driving private," although some of them may not be over-anxious to become "servants" instead of "employees."

#### A Garage Fire and Its Moral.

Accounts differ as to the precise manner in which the \$25,000 garage fire which Hartford, Conn., suffered recently had its origin, but they agree in one point—namely, that the combination of a taxicab chauffeur, a newly filled tank and a pair of oil dash lamps were involved in some way. The danger in connection with the refilling of fuel tanks is so obvious; the moral has been pointed out in so many cases, that the wonder is such an accident ever should happen. Garage-men are fully aware of the peril both of the vapor itself and of the combination which is apt to arise at any time when heedless manhood is given the handling of liquids which yield inflammable vapors. Such accidents, as a rule, do not occur where there is strict enforcement of certain obvious regulations in regard to the filling of tanks, nor are they apt to occur where cars are electrically lighted—two conclusions which it is well for the motor cab manager to ponder wisely.

## COMING EVENTS

April 28, Chicago, Ill.—Chicago Motor Club's 200 miles economy run.

April 30, Philadelphia, Pa.—Quaker City Motor Club's third annual roadability run to Atlantic City.

April 30, Kansas City, Mo.—Automobile Club of Kansas City's hill-climb on Dodson hill.

May 2, Denver, Colo.—Start of Flag-to-Flag endurance and reliability contest to City of Mexico for Wahlgreen trophy.

May 3, Trenton, N. J.—Trenton Automobile Dealers' second annual 300 miles endurance run.

May 5-7, Richmond, Va.—Richmond Times-Despatch endurance run.

May 5-7, Atlanta, Ga.—Opening spring race meeting on Atlanta motordrome.

May 9-11, Harrisburg, Pa.—Motor Club of Harrisburg's fourth annual reliability contest.

May 10-11, New York City—Motor Contest Association's reliability contest to Atlantic City and return.

May 11, Birmingham, Ala.—Birmingham Police Relief Association's race meet at state fair grounds.

May 13-14, New York City—Motor Racing Association's 24 hours race at Brighton Beach track.

May 14, Vicksburg, Miss.—Vicksburg Automobile Association's hill climb on Mackey's hill.

May 18, Cheyenne, Wyo.—Cheyenne Motor Club's race meet on motordrome.

May 18-19, Norristown, Pa.—Norristown Automobile Club's third annual endurance run to Scranton and return.

May 19-21, Hartford, Conn.—Automobile Club of Hartford's All-Connecticut reliability contest; 600 miles.

May 21-22, Brooklyn, N. Y.—Crescent Athletic Club-Long Island Automobile Club amateur touring contest on Long Island for Pardington trophy.

May 25, Columbus, O.—Columbus Automobile Club's reliability run to Indianapolis, Ind.

May 25, Buenos Ayres, Argentine Republic—Sociedad Sportiva Argentina's 375 miles international road race.

May 27, 28 and 30, Indianapolis, Ind.—Grand Circuit meeting and national championship races on Motor Speedway.

May 27-31, Washington, D. C.—Washington "Post" five days endurance run to Richmond, Va., and return.

May 28, White Plains, N. Y.—Amateur Automobile Contest Association's hillclimb.

May 29-30, San Francisco, Cal.—San Francisco Motor Club's two days race meet at Tanforan.

## HARROUN STARS AT LOS ANGELES

**Hoosier Wins Thrice and Shatters Records  
—Oldfield and DePalma See-Saw, but  
"Amateur" Twice Trims Oldfield.**

After a two days intermission, made necessary by the ruling of the American Automobile Association Contest Board that no sanction shall be issued for a meet extending over three days, racing was resumed on the Los Angeles (Cal.) motordrome on Wednesday, 13th, and with an idle day intervening, continued until Sunday, 17th, when the greatest and most brilliant motor racing carnival ever held in America and probably in any other country, came to a

The 601-750 class, which is the highest division in the A. A. A. category, and which heretofore has been devoid of any records listed under that heading, came into its own when DePalma opened an account by whipping off 10 miles in 7:38.23. Caleb Bragg, the other performer in the Fiat camp, distinguished himself on Friday by wiping out Kirscher's figures of the previous week for 4 miles in a time trial. Bragg was clocked in 2:40.70, which displaces the Dutchman's mark by .06 second, a pretty close margin. Kirscher, by the way, broke into the ranks of the honor men on Friday, when he pushed the Darracq around three times against time, and rung up 1:57.71, which betters Robertson's 1:58.90, recorded at Atlanta. Among the local talent Joe Nickrent, with a Buick, was

Wednesday—April 13th.

Four thousand people, which although the largest mid-week crowd ever present at a Los Angeles meet, seemed small in comparison with the throngs of the previous Sunday, came out for the second installment on Wednesday. The weather was ideal for racing and was responsible for some new insertions on the record slate.

Time trials were the first offering and furnished some sizzling dashes, but the only ones to alter the existing figures were Kirscher, who hammered down the 3 miles record of George Robertson from 1:58.90 to 1:57.71, and Bragg, with the Fiat, who essayed to shatter the time for three circuits, but quit in the last mile after appropriating the 2 miles record which stood to Kirscher's credit. Bragg flashed the dis-

SHOWING CARS IN PADDOCK, AND SCOREBOARD

VIEW OF STERN CHASE ON LOS ANGELES TRACK

close. The second half of the meeting was marked by even more remarkable performances characterized the opening.

Without question the star performance of the meeting was made on Saturday, 16th, by Ray Harroun and his Marmon stock car, when he won the two hours free-for-all race against a classy field, and reeled off 148 miles without a stop, establishing a new American record. The Indianapolis combination also shone prominently on the final day, by winning the 100 miles event for cars in the 451-600 class, in 1:16:21.90, and establishing a new class record for the distance. Harroun further distinguished himself by placing to his credit the 50 miles record in the 301-450 division, registering the half century in 39:53.55, as against 40:32.03 turned by Chevrolet at Atlanta last November.

Although the star bill on the card, the DePalma-Oldfield match again was declared off owing to the breaking of pistons in the Fiat in practice, DePalma scored twice in the class events. His first killing was on Wednesday, 13th, in the 50 miles free-for-all, which he melted without a stop in 37:55.53, new figures which supersede George Robertson's mark of 40:14.03, hung up at Atlanta.

the top notcher, and cut his 10 miles figures of 7:35.87 in the 301-450 class to 7:26.61. Nickrent also transferred to his account the 5 miles mark in the same class substituting 3:52.68 for the 4:45.50 which the late Borque achieved. "Me and my Car" Oldfield made several attempts to accumulate a few more records, but only succeeded in hitting the bullseye once, when driving a Knox in the 451-600 class, he lowered his figures for 10 miles from 7:22.92 to 7:20.66. This resume covers the record breaking performances at the last half of the carnival. It is expressed in tabular form as follows:

Distance.	Time.	Driver.	Car.
3	1:57.71	Kirscher	Darracq*
4	2:40.70	Bragg	Fiat*
5	3:52.68	Nikrent	Buick†
10	8:40.17	Nikrent	Buick‡
10	7:38.23	DePalma	Fiat§
10	7:26.61	Nikrent	Buick
10	7:20.66	Oldfield	Knox‡
50	37:55.53	DePalma	Fiat*
50	39:53.55	Harroun	Marmon¶
100	1:16:21.90	Harroun	Marmon*
148	2:00:00.00	Harroun	Marmon‡

† Record for cars 161-230 cubic inches.

§ Record for cars 451-600 cubic inches.

|| Record for cars 601-750 cubic inches.

\* Record regardless of class.

tance in 1:15.96, as against 1:18.52 made by Kirscher. Joe Nickrent, handling a Buick, was the only one to try for the 10 miles record and he got it by making the trip in 7:35.87. The old figures were 8:10.61, which were credited to Tom Kincaid in a National, and were made at Indianapolis on December 17 last.

DePalma and Oldfield both tried to get under the track record of 36.22, which the latter established in the initial session, but both failed to hit the mark. DePalma went around in 37.67, and Oldfield made the trip in 37.38. Oldfield's attacks on the half mile and kilometer were equally unsuccessful despite the statements of the local press that he broke the existing figures. His time for the half was 17.91, and the kilometer was reached in 22.88. The records stand at 14.76 and 17.76, both made at Brooklands by Hemery with the same car. In the half mile trial, however, Oldfield attained the highest speed ever made on the track, the Warner horograph indicating a gait of over 105 miles an hour. DePalma and Kirscher were the only contestants in the 10 miles free-for-all and put up a rattling good race, although the Dutchman's car outclassed the Fiat. DePalma made three efforts to go by, but on each attempt was

repulsed by Kirscher, who won easily by  $1\frac{1}{2}$  lengths. The time was 7:01.92.

Handicapper McMurty had figured close in the five miles handicap free-for-all, and it proved a hair raiser. Five started, Vogel in the Cole getting the limit, 50 seconds. Barney Oldfield was on scratch with the Benz. Harroun, in the Marmon, who had 10 seconds, and Livingston in the Stoddard-Dayton, with 12 seconds allowance, fought it out for first, the latter getting it by 32 seconds. Marquis, with 11 seconds, landed the Isotta in third place. Oldfield crept up slowly on the field, but never had a look-in for place. The time for the five miles was 3:50.55.

chivalrously declined, saying that there would be no glory in such a one-sided contest. However, Oldfield and DePalma got together in the 600-750 class, the former using a Knox, and DePalma trimmed the premier barnstormer, winning in 7:38.23, a new American record. Harroun took third with the Marmon. This race was marked by a sensational accident, which fortunately caused injury to no one. While leading, Kirscher's Darracq threw a tire and the car commenced to cut up capers, but was brought to a stop before harm ensued either to car or crew.

DePalma and Bragg, both in Fiats, were the chief contenders in the ten miles free-

Oldfield spun a half mile in 18.57 and made a complete circuit of the saucer in 36.99. Kirscher clipped off two miles in 1:25.88 and this wound up the festivities for the day.

Saturday—April 16th.

By all odds the best race of the meet was the two hours grind on Saturday when Harroun and his Marmon made a beautiful and consistent non-stop run registering 148 miles in the two trips of the minute hand around the clock. Harroun led DePalma and the Fiat at the finish by six miles, and smashed all records from 55 miles up. Livingston and the Stoddard-Dayton fin-

AL. LIVINGSTON, THE STODDARD-DAYTON PILOT

RAY HARROUN, WINNING MARMON DRIVER

The best race of the day was the 50 miles free-for-all, which had five starters. DePalma went to the front in the second mile, and with the pack at his heels, held it to the 21st, when Kirscher jumped and led for half a mile, and DePalma again got in front. Kirscher trailed him until the 39th mile, when he was put out by tire trouble and DePalma won easily. Livingston nosed out Harroun for second. The time, 37:55.53, was a new class record.

Friday—April 15th.

There was another lapse in the schedule on Thursday, as required by the rules, and the third and final instalment began on Friday and continued until Sunday. DePalma was the star performer on Friday and brought joy to the hearts of his admirers by trouncing Oldfield in decisive fashion. It was the first meeting on the new track of the two headliners, and although they did not drive their big cars, the clash, nevertheless, was of especial interest. In practice earlier in the week the pistons of the Fiat cracked for the second time—a similar accident having disabled the car at the time of the Florida meet—and as there were no spares available, the match was called off, causing great disappointment, as it was expected that this would be the red letter event of the meet. Upon the disabling of his big flier DePalma offered to race the big Benz with his 90 Fiat, but Oldfield

for-all, and finished in that order. The time was 7:11.62. Oldfield and DePalma met again in the ten miles for stock chassis, 451-600 class and this time the Pickens protege turned the tables on his rival and finished first in 7:22.92, a new American record. DePalma was second. Nickrent and the Buick came into the ascendancy again in the ten miles for stock chassis 161-230 cubic inches, and won easily, clocking 8:40.17—a new record, and a substantial reduction from the mark of 9:03.25, which Endicott had placed to the credit of the Cole the week previous.

A pair of Marmons, a Chalmers and a Buick took the word in the half century grind, the best thriller of the day. The first ripple of excitement occurred in the second mile when a steering knuckle on the Buick let go and the car careened down the track. Nickrent applied the brakes and came to a stop right side up without damage. In the meantime Harroun and Wade, in the Marmons, had been making a runaway, and when the Chalmers retired in the 36th mile the last vestige of opposition was removed. Harroun made a non-stop run, finishing in 39:53.55, a new class record which displaces Chevrolet's figures of 40:32.03, established at Atlanta. Bragg was the chief producer in the time trials and succeeded in clipping .06 second from Kirscher's time for four miles, making the trip in 2:40.70. His other effort at a kilometer netted him 25.13,

ished a good third with 137 miles to their credit. Harroun averaged 74 miles an hour, the best showing ever made by an American car in a long distance race. Eight started in the event, but three, the Corbin, Dorris and Oldfield's Knox, retired early. The fight for first was between Harroun and DePalma, with Wade in the second Marmon worrying the latter. Wade ran out of gasoline near the finish, allowing Livingston to take third easily.

The Marmon pair and Nickrent, in the Buick, met in the five miles stock chassis, 301-450 class, and after a spirited battle the Angeleno outpointed his eastern antagonists, finishing in 3:56.68. Harroun and Wade were placed in that order. DePalma and Oldfield came together for another round of their prolonged battle for superiority in the ten miles stock chassis 451-600 cubic inches, and Oldfield took first honors. Livingston landed the Stoddard-Dayton second. The time was 7:22.92, a new record and a substantial cut in the previous figures of 7:47.71, which Robertson hung up at Atlanta.

Much interest was evinced in the match between Oldfield in the Benz and Bragg with a "90" Fiat at two miles, which was run in heats. It replaced the abandoned match between Oldfield and DePalma, but the first heat was rather tame, Bragg winning easily in slow time, 1:28.73. The deciding heats were run on Sunday.

Sunday—April 17th.

A large crowd turned out for the windup on Sunday, chief interest centering in the finals of the Bragg-Oldfield match. On Saturday the men were sent away from a standing start, but Sunday the getaway was a rolling one. Again Bragg drew the pole, but the Benz went to the front early, and led by a length at the halfway pole. It looked like Oldfield's heat, but on the far side of the track the Benz swerved and Oldfield "pulled" her slightly. This was enough to let Bragg close up, and at a mile and three-quarters he was leading. Oldfield tried to "come back" in the last quarter, but it was too late, and Bragg led him at the tape in a blanket finish. The heat was much faster than the first, being run in 1:19.20. Second in importance to the match was the 100 miles stock chassis for cars in the 451-600 cubic inches class, and Harroun, who seems to be at his best in long distance events, repeated his usual performance by making a non-stop run and finishing first. He also set a new class record for the distance, 1:16:21.90. Nickrent in the Buick, who took second, threw a tire early in the race and the car hit the outside rail and then slid down the track. After losing several miles, Nickrent returned to the grind. Oldfield, in the Knox, lost much time by tire trouble and had to be content with third place. For his defeat by Harroun in the long distance event, Nickrent got a little consolation by trimming his rival in the 10 miles race for cars in the 301-450 class. He was clocked in 7:26.61, which materially bettered his mark of 7:35.87, made a few days previous.

Ford cars finished 1, 2, 3 in the only price event on the card, the class of cars selling between \$801 and \$1,200, three miles to go. Pratt, the winner, finished in 4:07.20, and Stearns and Olden followed in that order. Endicott added another feather to his cap in the 10 miles race for 161-230 class cars by winning handily in 8:46.74. Miller, Warren-Detroit, beat out Linthwaite, Firestone, for second.

The summaries:

Wednesday—April 13th.

Time trials—Half mile, Oldfield, Benz, 17.91. One kilometer, Oldfield, Benz, 22.88. One mile, Oldfield, Benz, 37.38; DePalma, Fiat, 37.67. Two miles, Bragg, Fiat, 1:59.96. Three miles, Kirscher, Darracq, 1:57.71. Ten miles, Nickrent, Buick, 1:35.87. (The 3 and 10 miles are world's and class records, respectively.)

Ten miles free-for-all—Won by Kirscher, Darracq; second, DePalma, Fiat. Time, 7:01.92.

Five miles handicap, free-for-all—Won by Livingston, Stoddard-Dayton (0:12); second, Harroun, Marmon (0:10); third, Marquis, Isotta (0:11). Time, 3:50.55.

Fifty miles, free-for-all—Won by DePalma, Fiat; second, Livingston, Stoddard-Dayton; third, Harroun, Marmon. Time, 37:55.53. (Record.)

Friday—April 15th.

Time trials—Half mile, Oldfield, Benz, 18.57. One kilometer, Bragg, Fiat, 25.13. One mile, Oldfield, Benz, 36.99. Two miles, Kirscher, Darracq, 1:25.88. Four miles, Bragg, Fiat, 2:40.70. (Record.)

Ten miles stock chassis, 161-230 cubic inches—Won by Nickrent, Buick; second, Endicott, Cole; third, Miller, Firestone. Time, 8:40.17. (Record.)

Ten miles stock chassis, 601-750 cubic inches—Won by DePalma, Fiat; second, Oldfield, Knox; third, Harroun, Marmon. Time, 7:38.23. (Record.)

Ten miles free-for-all—Won by DePalma, Fiat; second, Bragg, Fiat. Time, 7:11.62.

Ten miles stock chassis, 451-600 cubic inches—Won by Oldfield, Knox; second, DePalma, Fiat. Time, 7:29.2. (Record.)

Fifty miles stock chassis, 301-450 cubic inches—Won by Harroun, Marmon; second, Wade, Marmon. Time, 39:53.55. (Record.)

Saturday—April 16th.

Five miles stock chassis, 301-450 cubic inches—Won by Nickrent, Buick; second, Harroun, Marmon; third, Wade, Marmon. Time, 3:52.68. (Record.)

Ten miles stock chassis, 451-600 cubic inches—Won by Oldfield, Knox; second, Livingston, Stoddard-Dayton; third, DePalma, Fiat. Time, 7:20.66. (Record.)

Two hours free-for-all—Won by Harroun, Marmon, 148 miles; second, DePalma, Fiat, 142; third, Livingston, Stoddard-Dayton, 137. (Record.)

Two miles match, first heat—Won by Bragg, Fiat; second, Oldfield, Benz. Time, 1:28.73. Deciding heat run on following day.

Sunday—April 17th.

Ten miles stock chassis, 161-230 cubic inches—Won by Endicott, Cole; second, Miller, Warren-Detroit; third, Linthwaite, Firestone. Time, 8:46.74.

Three miles, stock cars costing between \$801-\$1,200—Won by Pratt, Ford; second, Stearns, Ford; third, Olden, Ford. Time, 4:07.20.

Ten miles stock chassis, 301-450 cubic inches—Won by Nickrent, Buick; second, Harroun, Marmon; third, Wade, Marmon. Time, 7:26.61. (Record.)

Two miles match, second and deciding heat—Won by Bragg, Fiat; second, Oldfield, Benz. Time, 1:19.20.

One hundred miles, stock chassis, 451-600 cubic inches—Won by Harroun, Marmon; second, Oldfield, Knox. Time, 1:16:21.90. (Record.)

#### New York-Atlanta Tour to be Repeated.

With the Glidden tour confined to the middle west and southwest this year, the East seemed to be left in the cold, as far as a touring contest of any size was concerned, but the untoured section is to be rescued from its forsaken condition by the generous intervention of the disinterested promoters of the New York Herald-Atlanta Journal good roads tour of last fall, which,

it now is announced, will be repeated early in June. The tentative dates selected are May 31-June 7, and application has been made to the Contest Board of the American Automobile Association for its official approval and sanction. Reversing the custom followed in the first run, the contest, it is hoped, will start from Atlanta, Ga., and finish in New York.

#### How to Locate Engine Pounding.

In endeavoring to locate an engine pound, a good scheme is to cut out the ignition in all but one cylinder, running on one at a time until each unit has been tried separately. A loose connecting rod or wrist pin bearing, or even a loose crank shaft bearing in the vicinity of one of the cranks will be located as soon as that particular cylinder takes up its work. Final determination as to the exact nature and location of the fault should be made with the aid of one of the several sounding rods which are on the market.

#### Plugs for Repairing Inner Tubes.

Tire plugs, of the sort most commonly associated with the repair of single tube bicycle tires, may be made to serve a useful purpose in connection with the automobile tires of the same classical nature as that for which the remains of the late imperial Caesar have been suggested innumerable times. Inner tubes of the sort applied to the larger sized automobile tires are nearly as thick as single tube bicycle tires, and will be found to take the plug repair much more readily than the more familiar patch.

#### French Touring Club Does Good Work.

The excellent work accomplished by the Touring Club of France is best illustrated by the fact that this association of motorists alone has spent over \$500,000 on road improvements in France, and this in a country whose roads are acknowledged the best in the world. The club at present is constructing, with state and other aid, a big alpine road from Lake Geneva to the Mediterranean, a distance of over 400 miles in an unbroken line.

#### American Motor to Take Up Racing.

Herbert H. Lytle, the well known racing driver, will have a new mount this season, having signed up with the American Motor Car Co., Indianapolis, Ind., which contemplates an extensive racing campaign. Lytle now is engaged in tuning up a machine which he will use for racing, and is credited with having made some remarkably fast workouts with it on the Motor Speedway.

#### Rules Against Motors for Marathons.

Because of the injurious effects which the gasoline fumes are said to have upon running athletes, the Athletic committee of the Illinois Athletic Club ordered the previous custom of having automobiles follow the marathon runners on their 26 miles jaunt to be discontinued.

**"PROS" RUSH FOR REGISTRATION**

Nearly 100 Now on A. A. A. List—Amateurs Are Few and at Least One is Not Above Suspicion.

Registration of racing drivers, the first direct attempt which the American Automobile Association has made to carry out the control of automobile competition along the lines which obtain in the government of other branches of sport, now is in full swing. In accordance with the new requirements, 83 professional drivers already have registered and been assigned official numbers by which they will be identified. A smaller number of drivers—13, to be exact—have registered as amateurs, but by the terms of the peculiar definition which the A. A. A. has established, no men who are in any way engaged in the trade will be permitted to register as amateurs, although their trade connections will not bar them from competition with amateurs and professionals, in the ordinary sense of the word. For unlike the amateur rulings in all other lines of sport, amateur automobile drivers may compete with professionals and still remain amateurs.

It was in consequence of this peculiar construction that Caleb S. Bragg was permitted to compete with Barney Oldfield and other well known professional drivers at Los Angeles, without impairing his standing on the registration list. Despite the fact that Bragg is known to have desk room in a New York automobile establishment, and that he drives a certain make of car, the agency for which is housed in the same building where he has his "office," he is said to have no official connection with the agency concern, and it therefore follows that he is a "simon pure" amateur—of the A. A. A. variety. The full list of registrations to date is as follows:

**Professional Drivers.**

Name.	Number.

**Bridgeporters Forced to Find New Hill.**

Because of the insurmountable opposition to the event which was manifested by a property owner on the course, whose ideas

of sportsmanship are regarded locally as being on a par with the antique furniture in which he deals, the Automobile Club of Bridgeport, Conn., has abandoned its hill climb on Sport Hill which was carded for May 30 and was one of the classics on the New England motor calendar. However, Bridgeporters will not be deprived of their customary Memorial Day motoring treat, for the local dealers' association has stepped into the breach and will promote a climb on Snake hill, in the town of Fairfield, a suburb of Bridgeport.

The hill is situated about two miles from Fairfield, and, while not as long as Sport hill, it is much steeper and has several abrupt turns. In the make-up of the card a departure from former custom will be made, in that all events will be for stock cars only, and there will be no free-for-all class. Timing will be by electrical apparatus. Work on putting the road in shape soon will be commenced, and efforts will be made to secure the militia to patrol the course.

**Chicago to Hold Floral Parade.**

Instead of holding a carnival week, with its attendant expense and volume of effort necessary, by the dressing up of salesrooms, the holding of open house and a card of varied contests, to officially mark the opening of the selling season, but which really began months ago, the Chicago Automobile Trade Association has decided that a floral parade on Saturday, May 7, will suffice to induce "prospects" to produce their check-books. Although the Windy City has had floral parades before, and good ones, too, the tradesmen plan to make the coming function eclipse all former efforts. Valuable prizes will be offered for the best decorated cars, both among the private owners and dealers, and from hints that have leaked out it is promised that there will be some novel and startling artistic ideas expressed in the decorative line. It is expected that over 300 cars will be in line, the parade committee already having booked 63 dealers who will enter cars, and it is planned to send out 6,000 invitations to private owners.

**Uncle Sam Reiterates His Ruling.**

Automobiles are not to be admitted free of duty as household effects, according to a ruling which has been promulgated by the Treasury Department. Heretofore there has been confusion and question as to whether foreign cars imported with household effects should be required to pay duty, but the judicial decisions on the matter having been recently adverse to the automobiles, the Treasury Department has instructed its agents accordingly.

**More Money for Spokane Taxicabs.**

New financial blood has been inculcated into the Spokane (Wash.) Taxicab Co., which has been reorganized and has considerably increased its equipment of rolling stock. Work soon will be started on a new three story garage to cost \$30,000.

## AN OWNER'S IDEA OF EQUIPMENT

Pennsylvanian's Order as an Example of Desire for Special Conveniences—Their Arrangement on His Car.

It used to be considered quite "the thing" by a certain class of motorists to deck out their cars with a wealth of trappings such as added no end of glitter to their appearance, and not a little labor for the man

The seats are upholstered in blue, full hand buffed leather, to correspond with the general finish of the car.

As for the special equipment, the lighting is electrical, served by storage batteries mounted under the seat and constantly kept charged by an Apple dynamo which is mounted under the hood, as shown in the smaller of the two illustrations, and directly driven by the motor. For starting, an automatic spring tension device of the Ever Ready type is installed in front, which

KLINE CAR SHOWING SPECIAL FINISH AND EQUIPMENT

to whom it fell to keep the brasses polished and in order. Altered views of the proper position of the motor vehicle in the social and business system have put an end to the extravagant addition of needless accessories; it is now considered proper to add nothing to the car save what is in the line of direct and obvious utility. How far the addition of useful luxuries may go without rendering the car of cumbersome appearance is well illustrated by the accompanying pictures, which show the Kline car which has just been supplied to H. C. Dodge, of York, Pa., by the B. C. K. Motor Car Co., of that city.

The car is a stock model 6-40 runabout, which is distinguished by such standard Kline features as cylinders independently cast but assembled in unit form by the method of flanged water jackets and through bolts, seven crank and five cam shaft bearings in the crank case; 123 inch wheel base, 36 inch tires, three-quarters scroll rear, and semi-elliptic front springs, flat tube cellular type radiator, I-beam front and full floating rear axles, leather faced cone clutch, shaft drive, three speed selective gearset, and dual ignition.

The car is finished in "battleship gray" with white mouldings with a blue stripe edged in goldleaf on the mouldings and a fine line of goldleaf inside; the seats are striped vertically with fine lines of blue and gold alternating. The gasoline tank is mounted back of the seat and over the deck.

in connection with a Crone gasoline pump connected to the carburetter, enables the motor to be set in motion merely by pressure on a button set in the foot board.

DYNAMO AND MAGNETO ARRANGEMENT

An Ever Ready speedometer, equipped with 75 miles lead and maximum hands and odometer attachment is used, as are the Kline receding glass front or wind shield and a Sager bumper. All the accessories are nickel plated, as are the lamps and metal trimmings, affording the vehicle a rather unusual and decidedly pleasing appearance.

## BABCOCK DEFINES ESSENTIALS

Syracuse Factory Man Sketches the Factors Involved in the Manufacture of the Modern Automobile.

While the average motorist possesses a fair idea of the construction of his car, few, if any, are familiar with the many details that have to be taken into consideration by the manufacturer who desires to put out a reliable product. In a lecture delivered before the Brooklyn Y. M. C. A., Mr. Babcock, of the H. H. Franklin Mfg. Co., Syracuse, N. Y., called attention to the many things necessary for the production of a satisfactory car, dealing in a popular manner with the various processes involved. These include not only the making and forging of the metal parts, the building of suitable bodies, and the proper assembling of the many parts, but also the careful chemical and physical tests of the materials used.

As the three features which include all the essentials of motor vehicles, Mr. Babcock names: Reliability, comfort and economy. Simplicity, which to some people may seem a distinct feature, Mr. Babcock considers merely a modifier of reliability and comfort.

When designing a motor car, it is absolutely necessary to know precisely what stresses certain parts will have to bear, and what stresses certain metals to be used in these parts are capable of withstanding. From this simple statement it follows that a thorough understanding of the physical and chemical qualities of a metal must precede any attempt to design a new car model. And as metals, such as steel, bronze, cast iron and aluminum, bought in the open market, are rarely, if ever, exactly up to specifications, it follows that the careful manufacturer must have his own testing and work shops in which all metals can be chemically analyzed, before they are incorporated in the mechanism of a motor car.

"In the early years of the development of the car," explained the speaker, "a great amount of material, such as the market offered, was gathered together by chemical analysis—heat treatments and mechanical tests—the many different kinds of steels which could be secured, and which had been developed to a great extent due to bicycle manufacture, were inspected and selected for their suitability in fulfilling the service intended. It became evident at an early time that a greater variety of steels would be needed than could then be secured. Therefore, automobile engineers working in conjunction with the engineers of the steel mills, gradually developed a line of steels that fulfilled all of the conditions required, and today we have a variety of nickel, vanadium, tungsten and chromium steels, which have been extremely useful in securing the reliability of the motor car. Sim-

ilar investigations were made of all other materials of construction. With these materials secured, and by a considerable further amount of work in our physical and chemical laboratories and design room we gradually developed the essential parts for particular uses.

"To eliminate weight which, for various economic reasons later explained, was desirable for us to do, the greatest attention was given to selecting the lightest parts made from the strongest material that would fulfill the purpose for which it was intended."

Pointing out how much each part depends upon correlated parts, the speaker called attention to the necessity of inserting entirely new material in certain engine parts, because a slightly harder steel is substituted for intermeshing parts. Should the old parts be retained it would develop in the course of a short time that the new and harder steel destroys the surface of the old parts which had not been designed with any reference to such hard steel. He laid particular stress upon the relation of weight and strength of supporting parts as is shown in Franklin practice, by a light engine supported on a light sill, which is supported on light axles running with light wheels, and causing but a light load upon the tires—all very necessary features in the elimination of undue strains. An increase in weight of any of these parts would necessitate a similar increase in weight and strength of all the other parts, in order to obtain the same co-efficient of safety.

Speaking of the purchasing of materials for manufacturing cars, Mr. Babcock stated that it is not only necessary to obtain suitable materials, but also to see that they can be secured in production quantities according to specifications. It always should be the policy of any successful company to purchase only the best of materials from the leading manufacturers. Cheap materials secured on low purchase prices cannot stand close inspection, or chance of rejection, while in addition to these drawbacks, uniformity is lacking in a high degree. All purchases should involve with them the understanding that specifications must be met exactly or rejections will occur.

Mr. Babcock then named a few of the important tests which should be applied to all parts, and which are absolutely necessary, in order to carry out high-class work. To insure the receipt of materials, as specified, exacting inspection is required, such as:

"Fracture tests for hardness, toughness, flaws, etc. Dimensional tests by instruments and jigs, general measurements, etc., for cylinders, pistons and like parts. Color and weight by comparison, for bronzes, aluminum, etc. Chemical analysis of steels, bronzes and oils. Sound tests by hammering, for concealed flaws. Comparison by samples and for fibrous structure, such as leathers, cloths, etc. Submersion tests for carburetter floats and oil cans, for leakage.

Valve, elliptic and clutch springs for strength at various openings. Electrical and leakage tests of spark plugs. Electric sparking and timing tests of magnetos. Tire pumps for compression and suction. Torsion tests of drive shaft steels. Tests for the strength of gear teeth. Maximum capacity, and check valve operation in the oiler."

Turning from the testing of parts to the mechanical equipment of a modern automobile factory, Mr. Babcock mentioned as chief factors to be considered in the choice of a plant: Building, power, light, precision tools, testing machines, inspection tools and jigs of the greatest possible accuracy, and the necessity of carrying out all processes if possible under the shop supervision.

"It is very important," he said, "that the mechanical equipment of a shop be so selected and arranged that the exactness of the work as specified can be secured. It is essential that such machinery and workmen who operate it can be housed in a manner that will encourage the workmen to fulfill the instructions of the specifications. This involves the building. In the present home of the Franklin, which is a gradual development from the early shop where the first model was built, the building and equipment growth has kept pace with its production growth. We have demonstrated that a comfortable and clean factory is the best equipment agent that can be secured.

"The buildings are laid out with reference to light, and the factory both by day and by night is well illuminated throughout for this particular work. Illumination during the dark hours is provided by the largest installation of flaming arc lamps in this country; 70 in all, giving a combined candle power of 210,000. This in addition to about 3,500 incandescent lamps. The effect of this illumination has a marked beneficial influence upon the character of the work, and throughout the full year there is no perceptible difference in this work due to a change in light.

"Every piece that goes into the Franklin car must pass the approval of an inspection corps, which is separate from the control of the shops, but controlled and directed by the engineering department. The inspections and tests here made are:

"Dimensional by jigs, such as the test of the transmission gear case as spoken of. Hardness tests with the file. Fly wheel tests for static balance. Leakage tests for gasoline tanks. Tests for the adjustment of the steering device. Weight tests of the piston rings. Gasolene level and possible leakage in the carburettors. Rear axle, noise and general operation. Transmission noise, strength and general running operation.

"Engines as worked in on motor jacks where they are driven for a number of hours by electric motors. They are then tried out under full rated load for power, speed and compression, on testing jacks with fan

absorption dynamometers. After these rigorous tests the engines receive a general inspection before they are sent to the car assembly.

"Chassis are tested for: General inspection, power, control, speed and noise. They are driven as great a distance under their own power and with heavy load in hill climbing tests as may seem best, in order to prove that their qualities are exactly as specified.

"The final test and inspection of the completely assembled car includes all the elements of the chassis itself, and in addition, finish and appearance of bodies and all body details. After such tests and inspection by the engineers, the cars must pass a satisfactory inspection by representatives of the sales department. They are accepted for shipment only upon such approval."

That not all the efficiency is due to good machinery and good materials, was admitted by the speaker. He maintained that the personal element had a good deal to do with the character of the work accomplished, and that a satisfied working force was another essential in the turning out of reliable and good cars. With this end in view, good wages paid to the men employed, and inducements given for extremely accurate work and discovery of faults in materials or design during the processes, are means to an end much valued by the manufacturer.

#### Lists Wide Range of Motor Supplies.

With descriptions of motor car, motor boat and motorcycle parts, fittings, sundries, tools, clothing and novelties closely packed in its 256 pages, the 1910 annual catalog of Charles E. Miller, of New York City, makes its appearance in bright yellow covers, blazoned with red. Miller, whose headquarters are at 97-103 Reade street, boasts 11 stores scattered in eight states, and in the role of manufacturer, jobber, exporter and importer, offers an astonishing range and diversity of articles, as the catalog makes manifest. The latter in addition to the general run of standard goods, naturally gives conspicuous space to a number of specialties of which Miller is either the exclusive importer or the manufacturer, including Brampton chains, Pan-American lubricants and metal polish, Miller plugs and vulcanizing substitute, and the like, while a unique minor feature of the book is the presence of two pages devoted to old fashioned steam car supplies, such as boilers, Klinger gauges, tubular burners and other fittings such as few jobbers now carry.

#### Inspection for the Torsion Member.

In overhauling a shaft driven car after a long tour, attention should be paid to the condition of the torsion member. If disaligned, the fault will throw added weight upon the universal members; if the shackling arrangement is defective in any way, it may lead to a serious or even fatal accident.

**FINDS PLANTS SADLY MISMANAGED**

**Startling Discoveries of a Factory Expert  
Visiting the Car Makers—Guessing  
at the Product's Cost.**

Almost without exception every automobile factory of importance in the United States is guilty of appalling wastefulness of method and shocking mismanagement in its manufacturing processes, according to a professional manufacturing expert who in support of his contention cites some of the startling conditions he found on a recently completed investigation trip to plants in Michigan, Ohio, Indiana and New York. He maintains, further, that few makers know the cost of a completed car, let alone the detail cost of its individual parts. His experiences and conclusions, although affected by a strictly professional viewpoint, are illuminating and suggestive in relation to a subject which is of rapidly increasing concern to the makers and the trade in general.

The critical observer who so freely and caustically finds fault with the present loose and extravagant systems that obtain in motor car manufacture is A. E. Lawson, factory expert for Suffern & Son, of New York, the latter being a firm of certified accountants. With a view to interesting some of the makers in the possibilities of improved factory systems and cost accounting, he called upon a selected list of the more prominent manufacturers, and even in those cases where his professional services were not immediately enlisted, he was given the opportunity of going through the factories and viewing at first hand the methods in use.

"Here and there among the smaller makers," said Lawson, in telling the Motor World man about his trip, "I found men who apparently had absolutely no conception of what a factory cost system is or of what its purpose is, but practically all of the larger manufacturers present the wholly different aspect, of knowing the value of and necessity for an improved system, but of being so swamped in the turmoil and stress of expansion and increased production that they have been unable to give proper attention to the practical economies of their business.

"With all due courtesy to the manufacturers who permitted me to go out into their factories and make such observations as I chose, I am constrained to say that the conditions I found are a disgrace. Only the fact that motor car manufacturing has expanded so rapidly and with so little chance to do anything but produce the greatest number of cars in the shortest possible time, can in any way excuse the terrible waste and costly laxity that is so obvious.

"In one factory, for instance, the manager

told me that he employed anywhere from a dozen to twenty private detectives in the guise of porters, window washers, helpers and assemblers, for no other purpose than to prevent tools from being stolen by the workmen, and that despite this precaution he could hardly keep enough tools in the factory to have work go on. When I suggested a central tool room, with a system of making each employee responsible for whatever tools he drew from it, the manager actually was surprised to learn that such systems are in smooth and practical effect in every other line of manufacturing where tools must be supplied to the men.

"At another factory I asked as to the method of determining the actual cost of a car. With a smile I was told that the cost of the various parts were figured out from the invoices, where they were bought outside, and guessed at if made in the factory, after which all the items that the makers happened to remember were added together and the result multiplied by two. The result thus obtained was again multiplied by two, to provide a safe margin for unseen costs, and the answer stood for the cost of the completed car.

"Upon asking permission to go through the factory of a manufacturer who has been in business a little over two years, I was refused. The refusal struck me as odd, because I had been given permission freely everywhere else. But after refusing my request, the head of the concern hastened to explain that conditions were so enormously bad in his factory that he was positively ashamed to have anybody see how bad they were. He explained that in the strain and confusion of increasing his production, he has become so tied up in knots that the whole factory was in horrible shape, and that there were so many things about his system that could be improved that he intended putting the whole improving job over until next fall.

"Just as a minor point I happened to ask, at another plant, why the men in the soldering department did not use gas or electric heaters for the soldering irons, instead of the old fashioned plumbers' stoves with charcoal. The superintendent, who was my guide, said that perhaps it would be a little cleaner, but that it would probably be more expensive and that it hardly seemed worth while to make the necessary installation to supplant the charcoal stoves. I therefore stopped and timed some of the workmen, and showed the superintendent that for every 1½ minute a man spent in actual soldering, he spent almost 4 minutes in poking at his charcoal and heating his irons, so that about two-thirds of the payroll in the soldering department was being thrown away.

"But such a point in factory economy is trifling compared with some of the big matters which are fairly groaning for attention, to stop the drains of wasted material, labor and power and the losses in efficiency due

to the men being handicapped and interrupted in their really productive work. In one factory, which has been held up as a model in its organization and system, I made a suggestion which has been adopted and which is resulting in a saving of from \$12,000 to \$15,000 a year."

"Upon visiting a plant in Indiana," continued Lawson, "I found a factory where the cars are what might be termed a purely assembled product, inasmuch as the manufacturers buy all of their parts outside and simply put the cars together. This plant had a fairly efficient cost system, and the head of the company was frankly happy in the realization that he had an advantage over the manufacturers who make their own parts, because he knew what every part cost him, and could figure his freight and assembling costs very accurately, while the other makers in most instances could only vaguely guess at their detail manufacturing costs. I was inclined to agree with him that those manufacturers who confine themselves purely to assembling have a distinct advantage in this respect, until proper cost finding methods are applied to the factories making their own parts.

"As a matter of fact there is no reason why a manufacturer should not know the exact cost of every minutest part of his car, as well as the cost of the various groups such as the power plant, the change gear mechanism, the rear axle and the complete body. And such cost finding does not necessarily mean turning the whole plant over into a bookkeeping establishment instead of a producing factory.

"Competition conditions are certain to compel motor car makers either to know their actual costs, and exercise the legitimate and important economies that prevail in other lines of manufacture, or to go into bankruptcy. In one large factory I was told that it has not been necessary to split hairs to ascertain the cost of the product, and that while profits are satisfactory and the demand so great, it would be foolish to waste the time necessary for the obtaining of such figures.

"Unquestionably the main point with the makers has been to produce the goods, without regard to petty details of expense, but a proper cost system, instead of hampering production, is the very key to raising it to the maximum, with any given equipment. No business can be expected to stand on the foundation of extravagance in manufacture. There is a difference between throwing money away and paying a high manufacturing cost for speed in production when the speed is worth the price. If the maker is paying extra for speed, he should know just how much he is paying, and should not let his money flow off in rivers of unseen costs and almost criminal mismanagement, in the complacent idea that he must stand such losses in order to meet the exigencies of his manufacturing rush."

**Points Out Detroit's Position and in Same Speech Discusses Present and Future of the Industry.**

"The automobile business has been built up so rapidly, and particularly in Detroit, that the people of Detroit generally do not realize what the automobile industry means," said Hugh Chalmers, president of the Chalmers Motor Co., in a speech delivered at Detroit College on Thursday last. "They take it as a matter of course. Visitors from outside marvel, and other cities envy Detroit.

"In order to realize what a tremendous industry it is, and how Detroit is affected by it, it is necessary for me to give you some facts and some figures, which I shall do as briefly as possible:

"It is estimated that there are 150 automobile companies in the United States. There are 35 companies in Michigan, with a total capacity of 140,000 cars annually. Twenty-three of these 35 companies are in Detroit, with a total annual capacity of 85,000 cars and a total capitalization of \$30,000,000.

"There are 39,000 people employed by automobile manufacturers in Detroit, and 19,000 employed by accessory manufacturers, making a total of 58,000 altogether engaged in automobile work in Detroit. This means that more than 200,000 people in Detroit are dependent upon the automobile business. Nearly \$1,000,000 weekly are paid out in wages here in Detroit by automobile and accessory manufacturers.

"Nearly \$10,000,000 is invested in automobile factories in Detroit. The total value of Detroit made cars this year will be about \$200,000,000. Detroit manufactures about 60 per cent. of the national output of automobiles. The automobile industry is now the most stupendous of all manufactured products.

"Detroit formerly was proud of the fact that it made more stoves, more pills, more paint and more freight cars than any other city in the country. The volume of the largest of these products in dollars and cents—freight cars—amounts to about \$18,000,000 annually. The product of any two of the more important automobile companies in Detroit will easily total \$20,000,000 a year. Detroit produces any kind of a car that anyone can want, from a \$500 runabout to an \$8,000 limousine.

"We are so used to speaking of automobiles in quantities of a thousand, and have become so familiar with them on the streets, that we forget that each represents a good deal of money, and that a few thousands of automobiles means the expenditure of a fabulous sum.

"The automobile business has raised the standard of factory conditions because it is

a business which calls for good factories, because expert work must be done, and these factories must have the maximum amount of light and air. On account of its being a new business, it has called for the erection of new factories, and most of these factories have been built along the most up-to-date lines. Our state factory inspectors say that the new, light, healthful and convenient buildings which the automobile manufacturers have erected have led to better factory conditions in other lines of business.

"The automobile business has made Detroit a great hotel town, and it also makes business better in every line. Think of the retail sales establishments and garages which the automobile business has brought into existence. Do you know that the automobile garage is the only new thing in architecture in several generations? Some of our new combination sales rooms and garages are among the most handsome buildings in the city.

"The fortunes that have been made and are being made in the automobile business come rather through great volume of business than through the large profits that are made on the individual car. Most of the big manufacturers today are making their money largely through the volume of output.

"People naturally ask, how long will the automobile business continue, and isn't it likely to be overdone? Now I am not a prophet and cannot tell just what is going to happen, but I believe that the automobile is not subject to any other comparison, because the automobile is the first improvement in individual transportation in centuries. The automobile has replaced the only thing in our civilization that has been the same throughout centuries, and that is the horse; so that I think the automobile will be with us as long as the horse has been with us. But whether or not the public can take the output of some 200 automobile companies is another and more difficult question.

"The automobile business is subject to the same laws and rules of business that any other business is subject to. It will, of course, result in a survival of the fittest. Those who have built the best cars at reasonable prices, and take proper care of the owners, have nothing to fear, in my opinion, from any question involving overproduction provided they do not over-produce themselves. After all, the question of success or failure in the motor car business is the same as in any other business—the matter of personal equation constitutes about nine-tenths of it.

"People used to think that any man who could lead a horse to water could run a farm, but they have changed their minds on that point. Some people seem to think now that any man who can build a motor car that has four wheels, that will run three blocks, can sell all the automobiles that he can build. This has been partly true in the

past, but will not be in the future. Only those companies that make an honest car to sell at a fair price, and who are in the business to stay, can hope to succeed.

"We are more or less confounded nowadays by a vast amount of advertising matter, and you could paste almost any name at the bottom of these advertisements and you could not tell whose 'ad' it was, but the buying public is fast learning that advertising does not create value in motor cars any more than in anything else—it merely tells of it—and I think that the companies that are building cars today, will be the companies that will be in business three years from now.

"This is the day when the smart business man tells only the truth in his advertising, and then makes good all the claims of his advertising when he sells to the customer. A man may for a few months succeed in fooling people by his advertisements as to the value of the goods he has to sell, but, mind you, I say only for a few months, because no one at this time of doing business can continue to succeed unless he is truthful in what he tells the people and then is honest in living up to these statements in his dealings with the people who are buying his goods.

"I have no patience or use for the advertiser who lies in his advertising, be he automobile manufacturer or any other manufacturer. It is not necessary that a man should tear down another to build up himself. It is not necessary nowadays to sell automobiles to claim to make the best car built and sell it for \$1,200. People know this is not true. I know it to be a positive fact that most standard manufacturers of automobiles today are giving value for the money, whether they are marketing a car for \$600 or selling one for \$6,000. The good manufacturer is today giving the buyer what he is paying for—a good car for a low price, or a better car for a fair price, depending upon the attention which is given to details entering into the construction of motor cars.

"Many people may get the idea that the automobile business cannot last because they read the advertisements of so many companies who claim big production, but most of these people do not begin to build the number of cars that they advertise they are building. Personally I never could see any advantage in such gross exaggeration of facts in advertisements, but of course each company must run its own business according to its own ideas; but it is fortunate for the public, and also for the companies, that they are not building the number of cars that they advertise they are building.

"I believe that the automobile business will be the leading industry of Detroit for more years yet than any of us will live, and I am not so fearful of a reaction in the present situation, because there are so many companies that are building good cars located here. Of course, many people fig-

ure that where money has been made, it still can be made, and the danger ahead of us is that too many people will get to thinking that way. Personally I would not take much stock in any new company that was just starting, because I believe the competition in the future is going to be keener by far than it has been in the past, and competition of course means the elimination of those who are unable or unfit to withstand it.

"The automobile business requires more capital in the conduct of it than most people realize, and while the profits to successful automobile manufacturers have been quite large in some instances, yet it must be remembered that the risks have been great in the automobile business, and where large sums have been made it must also be remembered that equally large sums have been lost.

"A company starting to manufacture automobiles must first be sure that the model it expects to market is all right and will meet with the approval of the buying public. After this is done, it must make a guess as to how many of these cars the public will buy the first year, and then it must start buying materials anywhere from six months to a year in advance and begin to turn out cars according to the model. Now if a company decides to build 2,500 cars, and would only succeed in selling 1,000 cars, it is a far more serious thing to have 1,500 automobiles left on hand at the end of the year's business than anything else I know of, and the disaster that would follow any company's unsuccessful attempt to sell its product in such quantities would be tremendous.

"The people who buy automobiles are, as a class, better informed about the thing they wish to buy than any other class of people on earth. They can ask more questions about the construction of an automobile, and can talk more intelligently about it, and have given more thought to it, than to anything else they have ever bought. Why? To a very large extent an automobile is a man's toy. It is his plaything. It is the thing he plays with like the boy plays with his hobby-horse. He talks about it at the club, and he likes to let his friends know that he knows something about the thing he is discussing, too. Hence, the increased knowledge on the subject on the part of buyers, and this very fact of knowledge will in time eliminate all companies and cars that don't deserve the public confidence. A man might own a typewriter or an adding machine for 50 years and never know or care what it was made of; but he doesn't own an automobile for 50 minutes until he wants to know what 'makes the wheels go round.'

"But this seeking after information on the part of automobile buyers has made all motor car makers improve their cars. It has brought more improvement in the construction of automobiles than anything else except, of course, races and contests."

## CHANCES FOR CARRIAGE BUILDERS

### They Are to be Found in Refurbishing and Selling Second Hand Cars—The Opportunities Presented.

Having been particularly active in discovering loopholes through which carriage builders might seek fame and fortune in the automobile industry, a well-known exponent of that trade recently has hit upon another expedient from that of assembling motor buggies and motor trucks, which it formerly recommended to its clients. The new opportunity is presented in the battle-scarred guise of the used or second-hand car, which after passing through a brief process of renewal is pictured as subject to ready sale at good profits.

"The thousands of local carriage builders throughout the country have of late been coming into a very lucrative branch of business in the shape of overhauling used automobiles and selling the same to those who are desirous of obtaining first-class mechanical equipment and good finish, but who are not prepared to pay the full price of the new high-grade cars," says the authority in question. "Thus on the one hand, the demand for remodeled cars, and, on the other hand, the large number of used cars discarded by those who feel that it is necessary to purchase a new car each year has opened up this very profitable branch for the carriage builder, and as long as fashion's decrees require a new motor car each year, these conditions will continue. And even after this practice of buying new cars each year has become less habitual there will always be a large number of second-hand cars on the market, and always be buyers for remodeled second-hand cars."

It is further explained in the same connection that, "This rapidly growing supply of used cars is creating the need for new channels of distribution. The regular agents, who occasionally take second-hand cars as part payment, cannot do so indiscriminately, as the disposal of the second-hand cars would soon claim too big a portion of their attention, taking up time and effort that could better be exerted in pushing the sale of new cars. Besides, the second-hand cars would actually kill many new car sales, because prospective buyers would often decide to take a remodeled car instead of a new one if the remodeled cars were in sight to divert their attention from their original quest.

"This condition of affairs, which is growing in importance as a factor in motor car retailing, has created a new line of business—the remodeling and re-selling of used cars. A few concerns have gone into this business on a large scale. For overhauling the cars they maintain shops which surpass in mechanical equipment many a motor car factory. They buy, overhaul or rebuild

and re-sell cars from all over the country, and even employ agents to represent them, just as manufacturers maintain agency forces for the distribution of new cars.

"In view of the fact that many local carriage builders are as yet unable to secure agencies for the particular cars they desire to handle, or are still undecided as to which make would best meet the requirements of their trade, the opportunity of entering the motor car trade opened by the situation in the second-hand field is worth attention. The carriage builder who realizes the desirability of getting into the motor car business, but who, for one reason or another, is not prepared to handle new cars, will find the second-hand car proposition an inviting subject for careful study and investigation.

"He can establish a selling agency for used cars to be sold 'as is' and work in conjunction with the motor car dealers of his vicinity, providing an outlet for the cars they take in exchange; or he can work independently and buy and sell outright or on a commission basis, maintaining a repair shop or not, just as he prefers.

"On the other hand, a carriage builder can act as a local agent for one of these large remodelers and distributors of used cars. In this case he holds the same relation between buyer and distributor as the agent for a new car holds between buyer and manufacturer.

"With facilities for coach work, upholstery and painting, the carriage builder has a decided advantage, as in many cars the mechanical parts need no overhauling, but a change of the body lines is desirable as bringing the car more up to date."

### "Licensed" Literature for Owners.

The campaign of "education" which the Licensed Association already has commenced with the public, by way of bringing the Selden patent situation to the latter's attention, has advanced to a point where individuals listed as prospective customers are receiving an explanatory booklet, bearing on its cover the title, "What is the Selden Patent on Gasoline Automobiles?" Especial emphasis is laid on the fact that "No bond is required when you buy a car licensed under Selden patent," this point being regarded as so important and suggestive that it not only appears as a chapter heading, but is also put in a "display box" on the front cover, and is again repeated toward the last of the book, in a paragraph set in capital letters. Another emphatic heading declares that "Licensed dealers decline to take unlicensed cars in trade." Recurring to the matter of bonds, and stating that some unlicensed manufacturers will give bonds, the booklet reveals an example of psychological and subtle artistry by stating that "it should be borne in mind that such a bond does not permit the owner of a car to use his machine if an injunction is issued, and that an unlicensed car may be difficult to dispose of."

**EMPLOYS DIFFERENTIAL PISTONS**

**Readily Convertible General Utility Vehicle with Distinctive Features—Ingenious Two-Cycle Power Plant.**

No more useful conception has been developed in connection with the commercial vehicle movement than that of the small or medium sized vehicle which is designed to fulfil a variety of purposes, according to the monetary requirement of the owner. For this purpose a number of machines already

The most original element of the machine, and in many respects the best suited to commercial vehicle requirements, is the power plant, which comprises a two-cylinder, two-cycle motor, shaft drive and axle-mounted planetary change gear. The motor is of the differential piston order arranged in a manner at once suggestive to steam engineers of the Wolf type of compound engine. The engine is valveless without crank case compression, and is rated at 20 horsepower.

The cylinders are counter-bored and fitted with two-diameter pistons. Induction draws the gas into the lower annular chambers

TEMPLETON-DUBRIE, CONVERTIBLE PLEASURE AND COMMERCIAL, CAR

have been put upon the market, among them a recent recruit in the Templeton-DuBrie, which is made by the Templeton-DuBrie Car Co., one of Detroit's newer concerns.

Besides being constructed with an open chassis, to which any one of a number of utility bodies may be attached, the regular stock equipment is of the convertible order. For farmers and other users requiring the plain delivery type of body, the open tray is useful. For passenger haulage, the sideboards may be removed and one or two seats set up behind the driver's seat, thus making a vehicle capable of carrying eight or nine persons without inconvenience. For more special requirements, the makers are prepared to install special bodies suitable for ambulance, piano, casket wagon, hearse, dry goods, catering, or creamery transportation purposes.

From the accompanying illustration it will be noticed that the general design of the vehicle has been worked out with a view to keeping the center of gravity as low as possible. The wheel base is 124 inches; platform springs and semi-elliptics in front render the suspension easy; and the I-beam front and live rear axle equipments, mounted on ball and roller bearings, the latter equipped with two sets of brakes, are of the conventional order.

surrounding the pistons during the down stroke. On the up stroke it is compressed to a tension of 40 pounds per square inch and is transferred to the opposite cylinder in each case, the piston of which is then at the bottom of its own stroke, and therefore ready to receive the fresh charge. Simultaneously in the compression chamber surrounding the lower part of the second piston a second charge of gas has been induced, which subsequently is compressed and transferred to the combustion chamber of the first cylinder. The pistons, connecting rods and crank shaft comprise the only working parts of the motor. Lubrication is by the conventional oil bath in the engine base. Cooling is effected by water, a geared pump being used for circulation purposes.

**Saving Tires at the Differential.**

Keeping the differential casing clean and filled to the proper height with a suitable grade of lubricant has a direct bearing on the wear of the rear tires. If the differential does not work freely a certain amount of cross slip between the tires is bound to result on curves. Besides tending to prevent this evil, frequent inspection of the differential gear ensures its being kept in good condition and prevents undue depreciation.

**HOW MOTOR CARS CONSUME COTTON**

**Industry Uses a Million Bales a Year, According to a Tradesman's Calculations—His Statistics.**

How very extensive has become the influence of the automobile industry in numerous lines which in one way or another have become tributary to it, is just beginning to be realized. Indeed, the very magnitude of the business of building motor vehicles is reflected by the breadth of its inductive effects. Thus, the rubber, steel, leather, and other markets and the industries which they feed already have manifested the effects of its growth in more or less important degrees, while now a big increase in the consumption of raw cotton is attributed to the same cause by F. L. Holmes, general manager of the Jackson Automobile Co., of Jackson, Mich.

"Automobiles require about a million bales of cotton annually," says Mr. Holmes. "of which 300,000 bales are used in the manufacture of automobile tires and protectors, 35,000 bales for the manufacture of 'leather' seats and cushions, 10,000 bales for the stuffing and upholstering, while the remainder is used for the manufacture of auto clothing, slip covers, insulating of copper wires, tool bags, tool rolls, waste and mercerized rain clothes. Take the question of automobile lubricating oils alone, millions of yards of duck 40 inches wide are used annually for the purpose of filtration, while mostly every car owner has a canvas cover to put over his car while standing in the garage, and the lamps and other bright parts are covered in rainy weather with enameled waterproof covers. All this uses up countless bales of cotton so that the automobile uses as much, if not more, cotton than the railroads and other allied industries, and has helped to increase the world's demand for the commodity by three million bales in hardly more than five years."

**Tests that Argue for Large Wheels.**

Rather a remarkable argument in favor of the use of large wheels and tires has been developed by Thomas B. Jeffery & Co., manufacturers of the Rambler car, in connection with a series of experiments to determine the relative longevity of tire equipments of various sorts. These experiments have developed an altogether unexpected difference in the wearing qualities of tires differing only slightly in size. Comparing the performance of a number of cars equipped with 36 by 4½ inch tires with that of others equipped with tires of two inches smaller diameter of wheel, and ½ inch less small diameter, it was found that the larger tires lasted just twice as long. Owing to their greater weight, it is to be presumed, the larger wheels also showed greater resistance than the smaller ones.

## DEPRECATES MOTOR FLEXIBILITY

Foreign Expert Champions the "One-Speed Engine"—Emphasizes the Necessity for Variable Gear Ratio.

At present there is a general movement among automobile designers to render the engine as flexible as possible, thereby relieving the transmission of as much of the burden of accomplishing changes in vehicle speed as is possible. While this has been the general rule in this country, there has arisen in England an unexpected champion of the "one-speed engine," who, for reasons which he sets forth in logical order, has arrived at the conclusion that the only proper solution of the problem of obtaining varying rates of vehicle propulsion is that of the infinitely variable speed change gear. While his reasoning is not calculated to appeal to the average motorist who is familiar with what has been accomplished in the way of engine flexibility, as applied to pleasure vehicle construction, it may, however, be considered suggestive of economical developments in the line of commercial car work, and therefore is well worth considering.

Flexibility in an engine, a contributor to the Autocar defines as the ability to deal equally well with a light load rapidly or a heavy one slowly; "that is, an engine worthy to be called flexible should be capable of yielding its full power irrespective of interchanges in value between the weight and distance factors of the load.

"It is exactly here," he continues, "that the gas engine falls short. A man may have a 10 horsepower engine under the bonnet of his car which will propel him at 30 miles an hour on the level, but should the negotiation of a hill increase the load sufficiently to reduce speed, then the output of power from the engine will fall also unless there be a change in gear ratio sufficient to allow of the maintenance of engine speed. To fulfil the requirements of flexibility the power available for moving the vehicle over a given distance should increase in proportion as the distance is reduced.

"Obviously, to couple such an engine rigidly to a load whose speed fluctuations may cover a wide range is to cripple its best possibilities, which is exactly why the one-speed car is not likely to establish itself. There is nothing impossible or even difficult about the production of a car whose engine is connected to its load without the interposition of change speed gearing. It is simply a question of under gearing or over-powering, or both. While the car is running fast the speed of the engine enables it to give good service, but when contrary conditions enforce a drop in road speed, then the engine is limited accordingly and must be sufficiently large and powerful to develop the required output through labor-

ing under the handicap of a low rate of revolutions. Do away with the inflexible connection and give the engine freedom to maintain its speed (and therefore power) irrespective of the changing nature of the load, and nothing better than the gasoline motor is to be had for a prime mover."

Comparing the gas engine with its two rivals, steam and electricity, he discovers that the first named is in a favorable position, but that it alone of the three can make no pretensions whatever as to flexibility. "Reduce the speed of a steam engine by overloading it," he says, "and the thrust on the crank will continue when revolutions have fallen to zero. Electricity goes one better, and yields more power with less speed, for if an electric motor be limited in its revolutions there will be an increased flow of current through the armature and a consequent rise of torque, and this action and reaction will continue until excess of load produces heating of the windings due to a too heavy flow of current through them.

"Ever since the general adoption of the internal combustion engine makers have chased this will-o'-the-wisp of flexibility. 'Spark advance' was thought to be an enormous step in the desired direction on account of the ability it gave to alter the firing point (and consequently period of combustion) to suit varying rates of piston travel. Later efforts have been chiefly in the direction of carburettors, and the patent records of the last ten years or so form eloquent testimony to the amount of inventive energy that has been expended. The result of all this work is the production of the present day engine which, in its best form, is capable of running satisfactorily at great differences of speed, and whose power of output is very nearly proportionate at any speed. That is to say, if reduced to half the speed at which an engine is designed to give full power it will give very nearly half its normal horsepower, or nearly all that is justified by the less amount of fuel consumed. The unfavorable difference is due, of course, to a slight accentuation of mechanical and thermal losses when running at a speed less than that intended by the designer."

Tracing the indicated line of progress further, the writer concludes that the only way in which the gasoline engine can reach its ultimate development is as a one-speed motor, coupled flexibly to its load by something in the way of reduction gearing, which shall enable engine speed always to be maintained whatever alterations there may occur in the nature of the work to be performed.

### Freedom in the Brake Equalizer.

When overlooking the braking system care should be taken to see that the equalizing device works freely. If for any reason it does not, it means that the brakes will be unevenly applied and that serious skidding results may follow.

## FOUR WHEEL BRAKING EQUIPMENT

Effects that Must be Reckoned with Concerning the Front Axle—Obtaining Maximum Efficiency.

While there are a number of commercial vehicles on the market, in which all four wheels are provided with brakes, as well as driving gear, the practice as yet has not extended to pleasure cars in this country. At least one foreign maker already has adopted the practice, as applied to light cars, and it has been proposed to equip heavy touring cars with a set of brakes acting on the front wheels in addition to the regular two sets fitted to the rear wheels. An English expert, to whom the proposition was submitted, called attention to the fact that the attaching of brakes to the front wheels would, first of all, require a complete re-designing of the front axle, as the enormous twisting stresses put upon an axle to which a strong brake is attached, would in all probability tear it away from the chassis unless special means were taken to prevent such a mishap.

Front axles, as at present designed, do not possess sufficient strength, in the opinion of the expert in question, and to fit the front wheels with brakes, without making due allowance for the added stresses put upon the axle, would mean to risk a fracture just at the moment when such an accident would be most disastrous. Not only the axle, but also the steering mechanism will be subjected to stresses from which it otherwise is free.

The braking power exerted on the axles depends upon the position of the center of gravity. Maximum power is obtained when the center of gravity lies a short distance behind the wheels which are braked. In an ordinary runabout where the center of gravity is about one-third the length of the wheel base behind the front wheels, the power exerted by front brakes would be considerably greater than that effective on the rear axle. The farther back the center of gravity is moved, the greater becomes the effectiveness of the rear brakes, with a proportionate decrease in that of the front brakes. The maximum braking effect is reached when the center of gravity is .178 of the wheel base behind the rear wheel. In this case, however, the car could only be kept level with the brakes applied, and would tip over backward as soon as it had lost its forward momentum and the brakes were released. If the center of gravity should be placed .1 of the wheel base behind the front wheel, application of the front brakes would result in an immediate tipping forward of the whole car. All of which conclusions are reached after a close mathematical study of the braking problem.

**WHY GARAGE IS NOT A NUISANCE**

**New York Supreme Court Lays Down the Law on the Subject—Objecting Neighbor Loses His Case.**

In many cities there has been friction between those proposing to establish garages in so-called "residential" districts and the property holders in those districts, the latter taking the ground that a garage is a "nuisance"; but the decision handed down by Judge Merrell, sitting in the Appellate Division of the New York Supreme Court in the case of *Sherman vs. Levengston*, puts a public garage in the light of a necessity and not a nuisance, and is calculated to discourage property owners from applying for injunctions against their erection or maintenance.

Considerable additional prominence was given to the case because of the fact that Richard W. Sherman, the complainant, is a relative of Vice-President Sherman, but despite the legal talent in the family, his attempt to secure a permanent injunction to prevent the Central Auto Sales Co. from building and operating a garage at Plant and Hart streets in Utica was unavailing.

Judge Merrell has handed down a voluminous memorandum of his opinion, showing with what thoroughness the court went into the law of the matter. After reciting the circumstances of the case, in which Harry M. Levengston, the president of the Central Auto Sales Co., was made defendant as owner of the land on which the garage is to be built, the court finds, first, that the objectionable features of the garage, if any, will be of a temporary nature and may cease at any moment.

What are referred to as objectionable features are chiefly noise and bad odors, which, if they ever come can only offend the occupant of the plaintiff's premises under the lease. The plaintiff is but a reversioner, and can have no present cause to complain. If objectionable conditions hereafter occur the relief of the courts may be invoked by the tenant. *Miller vs. Edison Electric Illuminating Co.*, 184 N. Y., 17. In that case Judge Cullen said: "Landlord and tenant have separate assets and each, if injured therein, may have redress, the one for injury to the reversion, the other for the injury inflicted in diminishing his enjoyment of the premises." Judge Cullen is quoted at some length, and his opinion is referred to by Judge Merrell as "entirely applicable to the case at bar."

Secondly Judge Merrell holds that the plaintiff's action is prematurely brought, not against an existing evil, but against one which is feared, and that if the defendant is once permitted to establish his garage he might acquire some rights and the nuisance, if any, would be entrenched. This, of course, is erroneous, as no user of how-

ever long standing can bestow any right to conduct a nuisance.

"To be entitled to injunctive relief at this stage of the proposed enterprise," the court continues, "plaintiff must establish the fact that a public garage must inevitably prove a nuisance—that it cannot be maintained except it violates the rights of those residing in its vicinity. There can be no speculation or uncertainty about it. It must be shown that the business proposed to be conducted is a nuisance per se. This it seems to me, the plaintiff has failed to do. Upon all the evidence I am convinced that a public garage may be so conducted that its objectionable features may be eliminated or at least minimized to an extent that its operation will not unduly annoy or inconvenience those who reside near by. . . ."

It is quite likely that many people for sentimental or other reasons might object to the location of a public garage or indeed any public business near their homes, but so long as the business to be carried on is legitimate, fanciful objection should not be permitted to prevent its operation. Undoubtedly there may be of necessity some noise from the proposed enterprise, but it must be borne in mind that what might be considered out of place and quite unbearable in a rural community or a country hamlet could hardly be so regarded in a busy city. Assuredly, a public garage may be kept clean and free from oil upon its floors. It may be so ventilated that noxious gases and odors will pass off and not be offensive, and proper rules may be promulgated and enforced whereby the noises incident to the garage, the testing of engines, the blowing of horns and other noises, may be reduced to a minimum. Indeed, it appears from the evidence that much of the noise from automobiles can be avoided and is due to a great extent to green and inexperienced drivers and crude machinery of the earlier type of cars. As time passes it is fair to assume that these objectionable features will be greatly reduced." The cases cited are *Heaton vs. Packer* 131 App. Div., 812; *Morgan vs. City of Binghamton*, 102 N. Y., 500.

In the *Heaton vs. Packer* case the plaintiff sought to enjoin the conducting of a hospital for the insane near his dwelling, and the injunction was denied upon the ground that the objectionable features which the plaintiff in that action apprehended were not inevitable and that the institution might be so constructed and managed that none of the evils anticipated by plaintiff might ever come. The rule sanctioned by the authorities and the text books with respect to the restraining of an apprehended nuisance by temporary or permanent injunction is that an injunction will not be granted unless it is apparent or inevitable that the proposed use of the property will actually result in a nuisance.

The case of *O'Hara vs. Nelson*, 71 N. J., Equity, 161, is cited and shown to differ

from the case at bar. In the New Jersey case the plaintiff's building was of wood and four or five feet distant, while in this case the plaintiff's building is brick and 70 feet distant, and the point in the New Jersey case was that the plaintiff intended to store large quantities of gasoline there. Finally, the business of conducting an automobile garage is not a nuisance per se, but is a legitimate and necessary industry. *Stein vs. Lyon*, 91 App. Div., 592.

"It is an oft-repeated expression that the automobile has come to stay," the opinion goes on to say. "They have ceased to be the plaything for the use exclusively of the idle. They have now become an important adjunct to our business and commercial life and are fast rivalling in general use the horse drawn vehicle. With them long distances may be covered with nearly the speed of the railroad train, and remote localities are reached where the railroad is unknown. Their use is not limited to a steel track nor governed by time schedules. In this era of good roads with the constant improvement of the highways, the use of the automobile as a means of transportation is bound to increase accordingly. The mechanism of motor cars is complicated, repairs must be made by skilled machinists and cars must be housed. Public garages have become a necessity. . . ."

"So far as the evidence before me discloses I do not think that the proposed use by defendant of his property is unreasonable, nor that he should be restrained therein, at least until the evils which plaintiff apprehends are shown to exist. Entertaining these views, I am constrained to deny plaintiff the injunction which he asks."

**Rowdiness Closes a Private Park.**

That the sins of the individual usually are visited on the whole community once more is proven by the action of James B. Duke, a millionaire resident of Somerville, N. J. The semi-public park of the Duke estate, with its fine driveways had been kept open for years to automobile owners, but the rowdyish behavior of certain motorists has caused Mr. Duke to bar automobiles from his park hereafter.

**To Permit of Special Roadways.**

In an endeavor to improve and regulate traffic conditions in Greater New York, Senator Schultz introduced a bill in the New York legislature, which amends the charter by authorizing each park commissioner to arrange public roadways, parks, parkways, boulevards, and certain streets so as to set aside certain divisions of the road for automobiles.

**Feed Piping that Should be Inspected.**

Engine lubricating systems which are provided with sight feed glasses mounted on the dash board, should be inspected occasionally to see that the connections of the piping which leads from the gauge back to the motor is in proper condition.

## LUBRICATION OF THE SPRINGS

**Necessity Born of Motor Car Usage—  
Example of Manner in Which It  
Now is Provided for.**

One point in spring design and construction which the early automobile builders overlooked, frequently to their cost, was the matter of lubrication. So much greater was the work of the motor car spring than that which the ordinary carriage was called upon to perform that entirely new traditions of service were brought into existence. The result was that springs which were not provided with direct and adequate means for preventing the abrasion of the moving parts speedily came to grief in one way or

another. Incidentally, not a little of the hard riding qualities to which some of the early cars were subject were attributable to the fact that the springs were not so constructed as to work freely.

With the modern forms of suspension, adequate provision for lubrication of the articulations is considered essential. Practically no cars are now put on the road which are not equipped with means of one sort or another to oil the spring joints, while the leaves themselves are taken care of by the use of special lubricating compounds in many instances. In the Franklin cars, which are distinguished for their light construction, considerable stress is laid on the use of full elliptical spring equipment. In this, it is to be observed that not only the points of attachment to the axles and frame, respectively, but the points of connection between the upper and lower sections of the springs are provided with means for lubrication.

The accompanying illustration shows how the shackle bolts at the ends of the springs are oiled. The construction provides for freedom of motion under all circumstances and also ensures the complete distribution of the lubricant over the entire working surface of the bolts. Needless to add, not

a little of the free action of the Franklin suspension may be set down to the special means which are taken to ensure the correct mechanical action of the spring members considered as parts of a moving mechanism, rather than as the static elements, which, somehow, they were considered.

### Dealing with "French Type" Cars.

Clear-cut illustrations showing no less than 11 different styles of body mounting, each designed to fulfil a different purpose from all the others, are used in the new catalog of the Croxton-Keeton "French type" motor cars, to demonstrate the broad adaptability of the chassis design which has been worked out for that vehicle. The term "French type," as is well known, is used to distinguish the 30 horsepower chassis from another size and style, which is designated as the "German type." The former, with which the new catalog deals exclusively, is so termed by reason of the fact that it embodies the dashboard form of radiator with gravity cooling circulation and other characteristics which commonly are regarded as of essentially Gallic origin. The chassis is put up with either right or left hand control, and with the levers mounted at the driver's right in either case. The booklet, which affords some useful information about the construction of the cars, is issued for gratuitous distribution by the Croxton-Keeton Co., Massillon, O.

### Furthering the "Live Map" Idea.

Almost as live as the Jones "Live-Map" itself, a highly diverting booklet has been issued by the Jones Live Map Department of the United Manufacturers, New York City. Actual photographic road scenes of the amusing and annoying difficulties of getting correct information from persons encountered on the highways or in the small towns are accompanied by brief and sprightly bits of text explaining the circumstances and results, and showing "what happens without it," while the concluding pages make clear, by word and picture, a full understanding of the "map" and the advantages of its use.

### Rust That Affects Appearance.

Pressed steel running boards of the sort which are composed of strips of metal placed on edge should be kept scrupulously free from rust or they soon will come to look extremely untidy and will cheapen the appearance of the car. Mud which accumulates in the interstices of the metal should be cleaned out with a bit of wood, and at the least sign of discoloration, the metal should be coated with asphaltum paint or some other rough preservative of the sort.

### Motor Police Patrols for Detroit.

Just to bear out its claim of being "the" automobile city of the United States, Detroit voted \$40,000 at a recent meeting of the city council for the purpose of substituting motor police patrol wagons for the horse driven variety.

## STAMPED PISTON AGAIN BOBS UP

**Englishman Revives Old Idea and Evolves  
New Method—Piston Formed in Two  
Halves and Then Welded.**

It is some little time since much has been heard of the steel piston, concerning which high hopes were entertained at one time. A recent development in this line, which has been produced in England, however, is of more than passing interest, because besides affording all the advantages of lightness and strength, which the original conception of the steel piston conveyed, it also combines the properties of low production cost and probably advantageous working results which the more modern processes and better materials render available.

The accompanying illustration shows in a general way the basic idea, which is that of forming the piston in two halves, by the usual drop press method, and afterward joining the sections by an autogenous weld. Each half carries one of the two bosses for the wrist pin, the operations incident to its construction thus being reduced to their lowest terms. After welding, only a single light machine cut is necessary in order to prepare the pistons for the final grinding process. The saving in machining costs thus effected is a considerable offset against the increased cost of the press work as compared with simple casting, as more commonly employed. The material used is a mild steel, well carbon soaked, and is said to work in even better than cast iron insofar as uniformity of texture and freedom from scoring is concerned. The total cost is said to represent an advance of only about 25 per cent. over that of the ordinary cast iron piston and is more than made up by the greater durability of the steel.

The design of this latest steel piston has been evolved by G. R. Gerrard, who is well known locally through his work in developing a British car which has attained some prominence in hill climbing contests. It is being produced by Messrs. Rubery, Owen & Co., of Darlaston.

**MOTOR CAR MAGIC IN THE DESERT**

**Wonderful Transformation in a Previously Desolate Community, as the Result of Co-operative Automobile Operation.**

Motor vehicles have become a power in linking up the farmer with the world which lies beyond his domain, as well as in expediting his labors, that the element of novelty long ago was swept away from most of the opportunities which the automobile presents in this connection. The result of co-operative effort in centralizing the life of a scattered community by the aid of modern transportation methods, however, is presented in an entirely new light in the case of the town of Imperial, which lies in what once was known as the Great American Desert. With the enthusiasm of the professional educator, Edward Hyatt, superintendent of public instruction of the California department of education, tells how an automobile transportation line has been developed there to useful purpose by co-operative means.

"I have just come from an official visit to the schools of Imperial county, a green and fertile region that less than a dozen years ago was the grim and desolate heart of the Colorado desert," he says. "In a night a wonderful civilization has sprung up. More than eighty schools are already in operation. The people in this new world are peculiarly free; free from tradition, free from common prejudice, free to do the best things they know. They can go directly to the newest and best educational ideas at once, without intermediate evolution.

"I have picked out one of these ideas as worth passing on to the school people in other parts of the state. It is worth reflective attention and is illustrated by a huge automobile that is used at the town of Imperial to knit the surrounding country into a strong school organization. Every day it makes its trips into the country, gathering up the older children for the agricultural high school and the younger ones for a strong grammar school in the town. The machine has seats in front and a freight compartment in rear.

"It can carry three tons of freight and can travel 20 miles an hour. It can take 20 people at a load and can haul big bundles of trees, plows, harrows, bales of hay, sacks of grain. It gathers up the milk going to the creamery. The farmers and their wives utilize its regular trips to fetch and carry from the town or to go as passengers themselves; fare two bits. The load of children is brought in 30 minutes. They are usually accompanied by one of the school trustees, who lives in the country and does business in the town.

"It costs the schools about \$100 per month, or less than 15 cents per day per child. The value of the machine is about

\$3,500. Its use compelled the building of good roads immediately. It is a means of communication and an agent of civilization for the community.

"The moral of the story lies in the idea of neighborhood co-operation. Perhaps this particular thing can not be used elsewhere; but it shows that a line of intercommunication can be established in sparsely settled regions that brings strength and life and social feeling to the neighborhood, that unites the weak and dying districts into strong, ambitious, graded schools and high schools adapted to rural life. We shrink from the loss of the little school from our own immediate neighborhood. We hang to it with death-like grip as an adjunct to the value and the attractiveness of our own homes.

"But the idea pictured here shows something better. It shows that an artery of enterprise and social life can be brought directly to our own homes that will give far more of value and attraction than a remote and dying school can ever do."

**Record Breaking Skidding Smash.**

Skidding has been responsible for a good many accidents, but rarely has the force of a skidding car been so plainly illustrated as in Boston, last week. The asphalt was extremely slippery and a heavy limousine was being driven along Beacon street, when the driver suddenly jammed down the brakes as hard as he could in order to avoid collision with several carriages. Before the heavy machine stopped skidding it had demolished two horse carriages, torn through an iron fence and smashed a hole into the brick wall of 117 Beacon street, from which it had to be extricated by a derrick. Luckily no one was injured.

**Automobiles for a Trade Junket.**

While the plan of wholesalers and jobbers making excursions to various towns and cities to visit their customers is not new in other places, Toledo wholesale merchants are utilizing the motor car instead of railroad trains in such expeditions, and thereby contrive to put some novelty and new life into an old custom which had grown uninteresting and perfunctory. Sections of Indiana, Ohio, and Michigan will be included in the trips to be taken from time to time. The whole project is managed by the merchants' and manufacturers' board of the Chamber of Commerce.

**Motors Improve Rural Free Delivery.**

At first thought there seems to be little in common between the rural free delivery and the automobile industry, yet reports in the departments at Washington have shown that the automobile has been a real help in facilitating the system of mail delivery in outlying districts. Wherever the automobile has made its appearance, better roads have followed as a matter of course, and the rural mail carriers have profited by the improvement.

**PECULARITIES OF PORTO RICO**

**Its Special Automobile Conditions Pointed Out by Consul Turner—Queer Ravages of Its Odd Climate.**

Coupling his report from Porto Rico with some very poignant advice, Consular Agent John M. Turner states some useful facts regarding touring, as well as market conditions, on the island. There are more than 1,000 kilometers of splendid roads on the island, and an appropriation has just been made by the legislature to extend many uncompleted roads and join ends of these with completed ones, thus extending the mileage. The island is hilly, and the roads were built for military and heavy traffic with little regard for easy grades. There are several 10 per cent. grades, and even one very stiff climb up a 12 per cent grade.

On account of the unfavorable climatic and topographical conditions, the field would seem a profitable and expansive one for repairmen.

"Some maker of automobiles," says Mr. Turner, "could easily capture the trade of these West India Islands if a machine were made to fit existing conditions. There is no frost here, the heat is uniform, and at times in the sun a machine will run at a continuous temperature of 125 degrees F. It may be that a larger radiating surface for this climate would be an improvement. The climate is hard on rubber, leather and polished surfaces, so that if improvements can be made in any or all of these, big strides will be made toward capturing the trade. Varnish does not last.

"A fine looking automobile will look like a second-hand one after 30 days' use. All exposed iron parts rust in a short time, brass tarnishes quickly, and nickel shows rust streaks after short service. Tops of leather are almost useless for automobiles, the rubber cloth ones do not last any time, and the only kind that seem to wear at all are those made of canvas, treated to make it waterproof. Some varnish or other polishing fluid should be used that would be more permanent. Leather molds quickly and needs constant cleaning. Other material that would not be attractive to moths, such as firm cotton drill, etc., could be used for covering.

"Three different agents have recently gone to New York to arrange for agencies for automobiles, and there are openings for others, so that manufacturers need not think the field is covered. The Porto Rican is a good spender; he is open to argument on machines, is not adverse to new things, and the trade is worth cultivating. Cars that will stand up under the work required will attract many buyers. Anything from a \$250 runabout to a \$5,000 6-cylinder car can be sold in Porto Rico and buyers are open for demonstrations."

## THE TOURING TIDE SETS IN EARLY

**Americans with American Cars Already  
"Doing" Europe—Branch Store that  
Has Become a Tourists' Bureau.**

Early as it is for motor car touring every indication tends to show that more Americans will travel on the roads of Europe this year than ever before. Last year saw all previous records passed, although by far the greater part was during the summer and fall months. But that touring is to become practically a year around pleasure is shown by the fact that up to April 1 of this year nineteen Pierce-Arrow cars had been reported at the European branch of the Pierce-Arrow Motor Car Co., at 22 Avenue de la Grande Armee, Paris. It is thought this number will not be 10 per cent. of the total that will be reported there by the end of the year.

When the branch first was organized in Paris three years ago it was for the purpose of supplying spare parts to Americans who were using their cars abroad. Since then its field of activity has grown until its principal work is to serve as a bureau of information for Pierce-Arrow owners, and to assist generally in avoiding the many little inconveniences that might come through a lack of knowledge of European customs and regulations for tourists. Many Americans consign their cars direct to the Pierce-Arrow branch from their sailing ports on this side of the Atlantic and when they arrive there find the cars uncrated and ready for their use. The branch is also called upon frequently for advice as to routings and employment of couriers. A full supply of spare parts is always kept on hand for any needs of tourists and an expert mechanic, trained at the Pierce-Arrow factory at Buffalo, is on duty at the French capital ready to render any assistance possible. As a result there has come one marked change in conditions, as many Americans who formerly bought or rented foreign-built cars for use abroad now take their own cars from this side with them.

### How France Will Squeeze Tourists.

Automobile people and hotel men in France are more or less up in arms over a new tax on motor vehicles which people who are familiar with French touring conditions say will provoke motorists to avoid the country, and that much more will be lost by their absence than the Government could receive in additional taxes from the measure. The new law, which goes into effect August 1, 1910, provides that automobiles brought into the country for any period less than one year shall be taxed \$1 per horsepower up to 12 horsepower, \$2 per horsepower between 12 and 60, and \$3 per horsepower for machines exceeding 60 horsepower. Cars remaining in the coun-

try less than four months get a slight reduction, but all cars are required to pay in addition to the special tax the regular license fee of from \$10 to \$20. By its terms the law applies to all cars, whether imported for temporary use or not. It is estimated that the revenue obtained from the tax can not amount to more than \$20,000, while nearly ten times that sum would be spent in a single season by motorists in France, who on account of this law would tour in other countries and give France a wide berth.

### Undertakers in Motor Project.

Although individual undertakers rapidly are coming to appreciate the utility of the motor vehicle in the transportation problems peculiar to their melancholy calling, the formation of a company with a capital of \$300,000 in St. Louis, by several undertakers who have no regular livery service in connection with their business, is a distinct novelty. It is the purpose of those interested to build a large garage and there to house four automobile hearses and thirty limousines. The cars are all to be of uniform type, and one of the hearses will be white. The seating capacity of the limousines will be from six to eight and they will probably be rented for \$6 each. The use of the hearse will cost \$10.

Realizing, however, that funerals are not quite frequent enough among those willing to pay for automobile corteges, to pay for the establishment, the company will not limit itself to funerals, but will furnish automobiles for weddings, theater parties and public parades or receptions. Undertakers who are liverymen are not joining the company as it will interfere with their livery business.

### Utah Tires of Mineral Rubber.

Experimental tires of "mineral rubber," or elaterite, are represented as being under test on motor cars in Salt Lake City, Utah, where two laboratories are indicated to be developing the commercial possibilities of the material. Elaterite, which is found in generous quantities among Utah's rich natural treasury of ores, is styled "mineral rubber" not only because its mineral components are almost identical with those found in rubber, but also because considerable success has been met in producing from it a form of synthetic rubber.

### To Save Roads in California.

Realizing at last that automobiles are not the only vehicles to be blamed for destruction of roads, Nevada county (Cal.) officials have passed an ordinance regulating the width of tires on all classes of vehicles, and forbidding the use of narrow tires on county roads. The ordinance is hailed with delight by farmers and automobile owners alike, for it usually was the narrow tread buckboard wheel which proved most destructive to roads by cutting deep-ly into them when they are soft.

## FOR A STATUE TO TIRE INVENTOR

**First Step Taken to Honor J. B. Dunlop—  
Despite Irish Claims, Scotland Prob-  
ably Will Get the Monument.**

Following the presentation to the Royal Scottish Museum in Edinburgh of one of the two original pneumatic tires, a movement to erect a statue to J. B. Dunlop, the now venerable inventor, has been undertaken, a committee having been appointed to further the project.

The subject first was broached at the time last fall when the English trade was doing honor and presenting a silver casket to Harvey DuCros, who first "boomed" the tire and who made millions out of it, at which time Dunlop himself was kept so far in the background that uneasy consciences were led to remark that Dunlop's turn would come next and to suggest that the erection of a statue would be the most fitting honor that could be paid to him by his grateful countrymen.

The movement to this end, which was started in Scotland, where Dunlop was born, has not progressed beyond the appointment of a committee, but already the proper location for the monument is giving rise to discussion. It seems probable that it will be erected in either Dregghorn, Scotland, Mr. Dunlop's birthplace, or in Edinburgh, which already is famed for its notable stonework and where, among others, there is a statue of Prof. Simpson, the discoverer of chloroform. Ireland, however, has voiced a claim for the honor; for very early in life Dunlop moved across the channel and, although he now lives in Dublin, it was in Belfast that, while following the veterinary profession, he conceived and developed and exploited the tire which now plays such a stupendous part in the world's affairs. "It was tested, developed and perfected in Ireland," remarks one of the Irish claimants, "and I therefore contend that the tire is 90 per cent. Irish." Scotland, notwithstanding, appears to have first call on the monument.

### Eggs-traordinary Yarn is Hatched.

Blaming the motor car for almost everything that ails the human animal is a pastime which increases with the popularity of the automobile. To the roster of evils attributed to the automobile, including "naso-motor-rhinitis" and the high prices of meats, shoes, rubber, etc., must now be added the scarcity of eggs. A statistician has just come to the front with the alarming information that each motor car on an average kills two to four chickens every year. As there are about 350,000 cars in use in the United States, he figures it out that automobiles are responsible for the destruction of about 1,000,000 chickens every year, which means a loss of 10,000,000 eggs.

**NEW YORK'S BILL UP TO SENATE**

**Passes Assembly and is Given a Hearing  
by a Committee of the Upper House**

**—Its Features.**

Having passed the lower house of the New York legislature on Tuesday of this week, escaping threatened amendments and eluding attempts to sidetrack it in committee, the Callan automobile bill now is in the hands of the Senate. It was introduced yesterday (Wednesday) by Senator Hill, taking the place of the Hill bill, and again was subjected to crossfire at a hearing which took place in the afternoon before the Committee on Internal Affairs. Charles Thaddeus Terry, counsel for the American Automobile Association, Oliver A. Quayle, of the New York A. A., and others who are active in agitating automobile legal matters, were present and offered subjects for amendment. The point attacked by Senator Hill himself and others was the proposal to insert an amendment which would restrict the power of local authorities so far as the regulation of speed is concerned to the more congested districts.

Edward J. McGoldrick, representing the New York City Corporation Counsel's office, opposed the annual registration fee of from \$5 to \$25, "in lieu of general or local taxation." He said that the New York City authorities objected to the requirement that all fines be paid into the State Treasury, and declared that the provision would mean a loss to the city of something like \$100,000 annually.

In its last stand in the Assembly, a number of efforts were made to alter its provisions. Two points of attack were the provisions for diverting the fees to the state from the communities in which the automobiles are owned, and which was declared to be unjust; and the speed clauses, which are held to be lacking in uniformity and tending to create a complex schedule that no motorist could follow. Besides the attempt to amend the bill on the floor, efforts also were made to sidetrack it in committee again. The several amendments were considered separately, however, and lost by decisive votes, despite the strenuous efforts of their respective authors.

In addition to the reciprocity clause, the bill in its present shape is a radical departure from the existing law in that it wipes out the progressive penalty for successive violations of the speed clause; permits cities of the first class, such as New York and Buffalo, to fix their own speed limits, provided they enact general ordinances prior to the law, if passed, going into effect; provides for the revocation of chauffeurs' licenses upon third offense, and designates a speed of 30 miles per hour as the maximum permissible within the meaning of the definition which requires "careful and

prudent" driving under any and all circumstances.

**Untangles a Park Towing Problem.**

The question of whether or not towing a disabled motor car constituted a "use of the park roads with other than pleasure vehicles" was decided in the negative by a magistrate in Baltimore, Md., as was also the puzzle as to whether a man seated in a motor car which is being towed by someone else is responsible for the speed at which the hauling automobile is being driven. Both questions resulted from the arrest of two men for speeding in Druid Hill park, one of them pulling the other's car at a lively rate over the driveways to the garage near the park. The judge decided that a "motor car that is not running by its own power cannot legally exceed the speed limit, nor can its owner be held responsible for its actions," and dismissed the charge against the owner of the damaged car. The driver of the hauling car was fined \$10. The second charge, that of using the park roads for other than pleasure purposes was dismissed, it being evident that the car had to be towed out of the park, and in order to be towed out, had to use the roads.

**Second Offenders Let Off Easy.**

Although arrested as a second offender, and despite the fact that the cause of his first offense had been the death of a man, "due to the failure of the defendant to adopt ordinary care while in control of a taxicab," James T. Gallagan, a New York chauffeur, was let go under a suspended sentence. Another chauffeur, also a second offender, who was awaiting sentence by the same judge in Special Sessions, was likewise released under a suspended sentence. Several letters addressed to the judge, recommending the two offenders and speaking highly of their abilities, were responsible for this unusual and somewhat mysterious leniency shown by the court.

**Two Years for Stealing Sheriff's Car.**

In an endeavor to stamp out the prevalent practice of "borrowing" motor cars without the owner's permission, a Milwaukee judge sentenced Albert Hermann to two years in the State Reformatory for breaking into the garage of George D. Sheriffs, Milwaukee, stealing the latter's touring car and riding around in it for two days, damaging it considerably. The car was found abandoned in a distant part of the city. This is the heaviest sentence yet imposed for "thefts" of this kind.

**Baltimore Recognizes Red Cross.**

Baltimore has come to the aid of motorizing medics by passing an ordinance permitting registered physicians to break speed regulations when driving to sick bed calls, the same as ambulances, fire engines and police patrols. Policemen will not be permitted to stop them, and trolley cars must

halt, while other wagons and automobiles must make room for them. In order to distinguish the physicians' cars from those of other owners, the Police Department has provided each physician with a sign about five inches square, bearing a red cross on a white background. The signs are to be placed on the front of the radiator. Penalties are provided for the illegal use of these signs by any other person than a physician, while the doctors themselves are supposed to be under a kind of honor system as to the use of their privilege only when answering bona fide sick bed calls. The use of the red cross on motor cars has been greatly abused in many cities, by others than physicians, hence the precaution of providing against its misuse by motorists in the Monumental City.

**Fined for "Roping" an Automobile.**

For having a set of guy ropes stretched across part of a street in Dawson, Ga., where they had no business to be, the owner of a circus was ordered to pay \$50 damages to a motorist whose car came into disastrous contact with said guy ropes. The case was carried to the Appellate Division of the Supreme Court, but the latter held that a petit jury was the best tribunal in the world to solve the questions of negligence and contributory negligence growing out of a transaction ex delicto between a motor car and a circus.

**"Joy Riding" Now a Crime in Canada.**

Following the lead of several of the states of the Union in taking action against so-called "joy riding," the House of Commons at Ottawa, Canada, has amended the criminal code, making it a penal offense for chauffeurs to take out their employers' cars without the latter's consent. Canadian newspapers have been clamoring for such an amendment for a long while, claiming that its passage would be of great benefit to the car owners and the general public.

**Bay State's Compulsory Lights Bill.**

After a good deal of discussion a bill at last has been introduced in the Massachusetts legislature, and favorably reported by the committee, to make it obligatory on drivers of all vehicles to carry a light visible from front and rear. Only slight opposition to it has developed thus far, and that from a few farmers opposed to the bill on the ground that it was absolutely unnecessary, because a horse could find its way even in the darkest night.

**Would Compel Extinguishers on Cars.**

If a bill introduced in the New York legislature by Assemblyman Goodspeed, of Kings county, becomes a law, automobile owners will have to add to their outfit of "accessories" a miniature fire department. The assemblyman wants all vehicles and boats propelled by gas, gasoline, petroleum, naphtha, alcohol or electricity, to carry a "non-liquid chemical fire extinguisher."

## RULES FOR THE GLIDDEN TOUR

**New Regulations Much Sterner than Previous Ones—Heavy Penalties Provided for Obtaining Outside Assistance.**

Although it will be more of an advertising exploit than ever before, the 1910 Glidden tour also will more neatly approach the true reliability contest in point of stiff rules than did its predecessors. It will be the seventh annual competition for the famous trophy, and a survey of the regulations reveals several changes and modifications over those of previous tours. As usual, there will be two trophies contested for, the lesser award this year being known as the Chicago trophy, which, as its name implies, was offered by the Chicago Motor Club.

Only stock cars, which have been examined by the contest board of the American Automobile Association, will be eligible to compete, and will be divided into two classes, touring cars contesting for the Glidden, and runabouts and miniature tonneau cars battling for the Chicago trophy, respectively. The toy tonneau class of former years has lost its identity, and now is embodied in the runabout class. Penalties will be on a point basis in accordance with a prescribed schedule, and the winners in both classes will be the cars finishing with the least number of penalizations.

Fixed penalties are provided, ranging from 1 to 500 points, and a sliding scale of such demerits has been devised for receiving outside assistance in making repairs. This system is very severe, providing double the regular penalties, so that it is unlikely that outsiders will be called on for more aid than is absolutely necessary. Roadside tinkering will be abolished to a great extent, according to the plausible inference conveyed by the rules, and the innumerable roadside stops for "tire trouble," which often were really mechanical ailments, in former tours, largely will be eliminated. Carburettors are to be adjusted only at night controls, which also will be the only official time for changing spark plugs.

Even more strict is the isolation of brakes from the obedient driver's mind. Throughout the tour they may be looked after only twice—at Memphis, Tenn., and St. Joseph, Mo. Engines with voracious appetites for fuel, oil and water will have their gluttonous traits duly recorded and in order that this accurately may be done cars are prohibited from taking on supplies except at the noon and night controls. For the first time hoods and coil cases will be sealed, and tools also must be carried in bonded bags. Accessories which get out of kilter are liable to be penalized, but this judgment will apply to them only and will not count against the car in the final examination.

Fixed running schedules are another innovation this year, and are set at 16, 18 and 20 miles an hour, respectively. In view of the severe penalties provided, it is improbable that there will be any perfect scores, but ties are within the range of possibilities, and in such an event it is provided that medals will be awarded to such cars, and their names will be inscribed on the trophies. Cars finishing with a percentage of 97 of the winning scores in each class will receive certificates attesting to their performances.

Contesting cars must at all times carry full standard equipment as well as four passengers in the Glidden and two passengers in the Chicago classes. An inventory of extra parts must be furnished before starting, and these will be sealed and checked. Tires, rims and chains may be carried without restriction. Tire repairs will be unpenalized, provided the engine is kept running, and time so lost will be added to the running schedule. As a precaution, to obviate a controversy at the finish, cars will be inspected before the start by a technical committee, which will note the condition of the car and seal mechanical parts to prevent adjustments being made undetected.

Drivers may be changed as often as desired, and the only advertising permitted will be the name of the car in letters four inches high, which may be displayed on all sides. Checking stations will be established at desirable points "to prevent speeding" and cars passing the pacemaker, except in the event of the latter being disabled, will be disqualified. Entrants arrested for speeding will be liable to disqualification.

Observers are expected to observe in the full sense of the word everything pertaining to their own and all other cars, and jot down what they see for future use. The competing cars will be divided into seven divisions, according to the 1910 A. A. A. price classification. Four divisions, comprising all cars selling between \$1,601 and \$4,000 and over, will travel on a 20 miles an hour schedule. The \$801-\$1,600 classification embraces two divisions, which are assigned the task of covering 18 miles of road per hour, and the "baby class" for cars selling under \$800 will glide along at the modest gait of 16 miles in one circuit of the minute hand around the dial.

After the cars reach Chicago they will receive a further grilling at the hands of the technical committee, which will put motors, transmissions, clutches and brakes through their paces under actual conditions. Contestants who abandon the contest will incur official displeasure to the extent of an extra 1,000 points, in addition to those already secured.

Starting from Cincinnati, O., on June 15, the contest will traverse 10 states, covering approximately 2,500 miles and will finish in Chicago June 29. The longest day's run will be from Texarkana, Ark., to Dallas, Tex., 230 miles.

## PATHFINDER IN MISSISSIPPI MUD

**Glidden Scouts Encounter Fearful Roads and Unbridged Streams—But Finally They Got Into Memphis.**

With the assistance of a double yoke of oxen, which were called on to haul the car out of a mudhole in a Mississippi swamp, the Chalmers Glidden pathfinders arrived in Memphis, Tenn., on Wednesday, 20th, having traversed five states and covered approximately 650 miles. Notwithstanding the adverse road conditions which have been encountered, due to the unusually heavy rains, and which have made the jaunt so far anything but a pleasure trip, it is believed that in June the roads will be in prime condition for the tourists.

Good roads were found on the second day, after leaving Lexington, Ky., and the mileage of the first day was greatly exceeded, the scouts putting up for the night at Louisville. Thursday, 14th, the third day, saw the expedition still in Blue Grass territory, the night rendezvous being Bowling Green. On Friday, 15th, the fourth day out, the first real hard going was encountered between Bowling Green and Nashville, Tenn., which was the night stop, the day's run being 63 miles.

Tennessee's crying need of bridges was well exemplified by the swollen condition of the unspanned streams which were met and forded on Saturday. Slow but sure progress was made until Buffalo Creek, 66 miles from Louisville, was reached, when the pathfinders were compelled to enjoy the hospitality of a mountaineer's cabin for the night, to allow the waters to recede before exploring further. After plowing through red loam and clay roads all day Sunday, which had been converted into fearful condition by the incessant rains, the odometer registered 119 miles and the pathfinder spent the night at Sheffield, Ala.

It is expected that these roads, which are well nigh impassable now, will be in excellent shape when the tour gets under way as the dry season then will be on. The roads still continued bad on Monday and slow progress was made, the night being spent in a squatter's cabin in the Yellow River region 50 miles from Sheffield. For the first time the sturdy Chalmers motor succumbed to the clay swamps of Mississippi on Tuesday and a double yoke of oxen had to be used to haul the car out of a mudhole near Burnside, where it sunk until the wheels were lost to view. That night the party "registered" at a shanty near Grand Junction, where they partook of a sumptuous dinner consisting of boiled pork and corn bread. On Wednesday the pathfinders negotiated the 53 miles from Grand Junction to Memphis, Tenn., which will be the first Sunday stop on the tour.

**T**HE Fifty-four Toy Tonneau is a mid-season New Rambler model. It is an evolution from the Close Coupled model, designed for the same demand, but a little more roomy.

Its advantages are low seats, two inches longer than usual from front to back. Seat cushions tilted and rakish seat-back to correspond. Body smaller and lighter than the touring car but tonneau roomy enough for three people of average size. Three inches more leg room in front than touring car. Rakish steering column.

With five lamps, Prest-o-Lite tank or generator, magneto and storage battery, horn and tools, \$2,250. Top with side curtains, \$100. Wind Shield \$40. Spare Wheel \$85.

**Thomas B. Jeffery & Company**

Main Office and Factory: Kenosha, Wisconsin

Branches: Chicago, Milwaukee, Boston, Cleveland, San Francisco

## Club Elections

At a recent meeting of the New Haven (Conn.) Automobile Club all the former officers were re-elected. They are the following: Thomas G. Bennett, president; J. Goodheart, vice-president; C. E. Thompson, treasurer; W. T. Dill, secretary.

The Cheyenne Motor Club, at its annual meeting, elected the following officers: George H. Nagle, president; J. E. Stimson, first vice-president; John Thomas, second vice-president; George S. Walker, secretary-treasurer; E. J. Sigwalt, assistant secretary.

The Fargo Automobile Club, Fargo, N. D., was organized recently with 35 active members. The following officers were elected for the coming year: President, W. J. Price; vice-president, R. H. Lewis; secretary, Seth Richardson; treasurer, M. A. Baldwin.

At the annual meeting of the Bradford (N. Y.) Automobile Club the following officers were elected for the coming year. L. E. Mallory, Jr., president; A. J. Bond, vice-president; J. H. Rose, secretary and treasurer. The executive committee consists of O. F. Schonblom and W. S. Gaffney.

Chauffeurs of Los Angeles, Cal., have organized, under the name of the Los Angeles Chauffeurs Benefit Association, with the following officers: John H. Hards, president; William Bell, vice-president; George Ferris, secretary. The organization starts with 25 members and will be conducted on fraternal lines.

The annual election of officers of the Automobile Club of Southern California, held at Los Angeles, resulted as follows: Roy P. Hillman, president; Fred L. Baker, vice-president; Cotton A. Smith, secretary and treasurer. Representatives of all counties in the southern part of the state were present at the meeting.

At the recent annual meeting of the Portland (Ore.) Automobile Club \$1,000 was voted to be expended in installing road signs. The following new directors were elected: E. H. Wemme, Elliott Corbett, Julius Meyer, F. B. Riley, Dr. Andrew C. Smith, W. C. Clémens, Bert Mackay, Lewis Russell and M. C. Dickinson.

Devil's Lake motorists got together recently and organized an automobile club with forty charter members. The following officers were elected for the first year: Blanding Fisher, president; Felix Routier, vice-president; Charles Pilsbury, secretary; Howard Whipple, treasurer; Charles Russell, M. A. Dohney and Edward Richardson, directors.

Representatives of a dozen automobile clubs of Nebraska met at the Commercial Club, Omaha, and organized the Nebraska

Automobile Association. The following officers were elected: W. R. McKeen, Jr., president; L. M. Falmadge, first vice-president; Dr. W. J. Phillips, treasurer; Harry Rolfe, secretary; C. W. Y. Loucks, assistant secretary.

Officers for the coming year have been elected by the Cheyenne (Wyo.) Motor Club as follows: George H. Nagel, president; J. E. Stimson, first vice-president; John Thomas, second vice-president; George S. Walker, secretary and treasurer. The club voted to hold a race meet on the motordrome May 18, and preparations for the event have been begun.

At the annual meeting of the Automobile Association of Rochester, N. Y., an entirely new staff of officers were elected, as follows: President, E. G. Strong; first vice-president, William C. Barry; second vice-president, W. W. Hibbard; treasurer, W. W. Drake; secretary, Bert Van Tuyle. The secretary's report showed a membership of 804, an increase of 281 during the year.

At a meeting of the Automobile Club of Troy, N. Y., the following officers were elected: Charles C. Kelly, president; Frank Gilbert, vice-president; Alonzo McConihe, secretary. The board of governors appointed at the same meeting consists of the officers and H. F. Boardman, James Lucey, Jr., John McGlynn, H. S. Ide, E. S. Platt, R. C. Reynolds, W. P. Warren, Jr., and John Paine.

Alvas W. Brown was elected president of the Grand Rapids (Mich.) Automobile Club at the annual meeting of that organization last week. The other officers chosen were O. H. L. Wernicke, first vice-president; Melville R. Bissell, second vice-president; Dr. F. C. Warnshuis, secretary; Dr. W. M. Budleson, treasurer. The officers, Fred Z. Pantlind and Thomas F. Garrett, constitute the board of directors.

Wallingford (Conn.) motorists a few days ago gathered for their annual meeting and elected the following officers for the following year: D. L. Barber, president; Dr. J. H. Buffum, first vice-president; George A. Youlden, second vice-president; F. L. Lathrop, treasurer; W. A. Ingraham, secretary. The following committees were also appointed: Legislative, H. W. Andrews and C. A. Harrison; runs and tours, O. H. Fowler and G. A. Youlden; good roads, Dr. Grainhard and Dr. Buffum; membership, F. E. Burchfield, W. H. Dunn and J. E. Hall.

Dallas (Texas) automobile owners, following the example of the dealers, organized a club at a recent meeting at the Oriental Hotel. The following officers were elected: George W. Baker, president; Lee Newbury, first vice-president; W. A. Fraser, second vice-president; C. C. Slaughter, secretary; C. B. Gardener, treasurer. The board of trustees comprises Judge E. B. Perkins, George A. Folk, I. Dreeben, A. J. Knight and James Berry.

According to reports made at the recent annual meeting of the Ohio State Automobile Association in Columbus, the clubs affiliated with the state body have 1,773 members. Harry L. Vail was re-elected president of the association, while A. B. Heyl, secretary, and C. L. Colter, treasurer, were also re-elected. P. B. Money-penny, Columbus, was elected first vice-president; James A. Allen, Kenton, second vice-president, and Cyrus E. Mead, Dayton, third vice-president.

### New Fire Truck for Middletown, Conn.

Middletown, Conn., is to lose its artistic automobile fire engine. Not because the motor did not work satisfactorily, or the pumps refused to be pumped, but because the "truck" (if the artistic creation can be designated by this vulgar name) was so remarkably constructed that only four very slender members of the energetic and willing volunteer department could ride on it at one and the same time. Before going to a fire, the eager members gave a good imitation of a class rush at near-by Yale university in the valiant endeavor to get a ride on the artistic contraption, with the net result of scraps and squabbles galore, while the fire burned its merry way through the flimsy frame buildings. Mayor Fisher, who is a Reformer (with a capital R) now is advertising the fire truck for sale, and is going to buy one which has no engraved name plates, silver-plated trimmings, and hand buffed leather seats, but which will accommodate at least a dozen of the valiant fire-fighters.

### Denver Petitions for Motor Mail Cars.

The great success of the automobile mail wagons in the various cities in which they are used, has caused Denver (Colo.) post office officials to petition Washington authorities for several of these motor cars to be run in that city. Both the large mail wagons now used for hauling mail to the Union station and the one horse gigs employed in the collecting service will be dispensed with if the automobiles can be secured.

### Hot Springs Has Warm Welcome for Cars.

Hot Springs, Va., which hitherto has kept out automobiles as much as possible, has changed its attitude and the motor car henceforth will be an important factor in the life of that resort. The Hot Springs Hotel Co., departing from its former policy of barring motorcars from its sheds, has built a roomy garage that will accommodate forty machines, and is otherwise catering to the needs of the motorists.

### Ohio Registrations Rise to Record Level.

Registration of automobiles in the state of Ohio reached a new high level on April 1, with a total of 17,477, for the three months of this year. The revenue from motor cars alone has been \$88,664.50 for the same period.

## The Tire That's Oversize

Each Goodyear Detachable Automobile Tire is considerably larger than its rating. So in Goodyear Tires you get extra size plus extra quality. Larger tires mean increased mileage, less punctures and blow-outs and more satisfaction.

Because of this Over-size feature and the other Trouble-Saving and Extra Service-Giving features to be found only in Goodyear Tires, we have been awarded contracts from 44 Automobile Manufacturers to equip 36% of the estimated 150,000 cars to be made in 1910. The contracts total up to the greatest number of tires ever ordered from a single tire maker in the history of the automobile industry.

# GOOD YEAR

### Straight-Side Automobile Tires

are guaranteed against Rim-Cutting, Creeping and Coming Off. The outer sides of the tire are straight, permitting the use of a rim with a wide rounding lip where it holds the tire in place. There are no sharp edges—nothing to cause a rim-cut, even though the tire be ridden flat. 64 tapes of piano wire are vulcanized into the base of each tire (see white spots in section). These contract with inflation until the tire grips the rim so tightly that it can never creep, even though but partially inflated. No tire bolts need to be used. Goodyear Tires are supreme in resiliency and are easiest removed and replaced. Send for our valuable book, "How to Select an Automobile Tire." It's brimful of "Tire Sense" and is free for the asking.

### When You Tell It at the Club—

When you say, "I had the car up to sixty miles this afternoon," just add—

"That's what the Warner Auto-Meter registered."

That'll settle it.

For among motorists everywhere, the Warner Auto-Meter is acknowledged to be the absolutely accurate, dependable speed indicator. It's "always all right." Right in principle, right in performance. Built like a fine watch, and just as reliable.

# FOX

## Anti-Skid Chains

1 2

Here is the side of the FOX cross chain which goes against the road and ABSOLUTELY prevents skidding.

**No. 1.**—Note the square gripping surfaces here which grip the road—there are twelve gripping places on this one link—contrast this with the ordinary chain with its ONE gripping point. These four-square gripping surfaces on the Fox, hold the car from skidding in ANY direction while other chains exert such efficiency as they may have in only one direction.

**No. 2.**—Note how the link of the chain which passes through another link is inside a little box at the point of contact so that this angle cannot touch the tire nor be broken by striking stones.

### THE FOX SAVES TIRE BILLS.

In the Fox, no edge, no cutting surface of any kind comes against the tire. Nothing except a broad, flat, perfectly smooth metal surface **without edges**, touches the tire. The broad flat links fit the shoe as harmlessly and as closely as a piece of tire tape. If you should swing a heavy sledge hammer against the links of the Fox Cross Chain, not once, but **many times**, you could not make it cut into the tires. If you should do this with other chains, you would quickly drive the links into the rubber and cut a great hole perhaps with the very first blow.

Send for Free Booklet.

### FOX METALLIC TIRE BELT CO.

1999 Broadway,

New York City

## RECENT PATENTS.

950,191. Gearing for Motor Vehicles. Charles Schmidt, Detroit, Mich., assignor, by mesne assignments, to Packard Motor Car Company, Detroit, Mich., a Corporation of Michigan. Filed Feb. 6, 1905. Serial No. 244,437.

1. In a motor vehicle, the combination with the gear case, of a shaft rotatably mounted in said case, a driven gear on one end of said shaft and a driving pinion on the other end thereof, a bearing for the shaft intermediate said gears, and a bearing for the end of the shaft beyond the driving pinion, said latter bearing comprising an outer ring secured in a bracket of the casing, an inner ring upon the shaft, and intermediate balls.

950,206. Starting Device for Internal Combustion Engines. Robert J. Gibbon, Chicago, Ill., assignor, by mesne assignments, to International Device Company, a Corporation of South Dakota. Filed April 17, 1908. Serial No. 427,607.

1. A single stroke internal combustion motor comprising, in combination, a cylinder, a reciprocable piston therein, an exhaust port in the side wall of the cylinder adjacent each end thereof, the outer port being uncovered by the "out" stroke of the piston, the inner port being covered by the piston at the end of its "in" stroke, and a valve for the last named port, openable only during the "in" stroke of the piston.

950,276. Carburetter. Percy J. Dasey, New York, N. Y., assignor of one-half to Thomas J. Wetzel, New York, N. Y. Filed Jan. 2, 1909. Serial No. 470,394.

1. A carburetter having a valve and a seat from which said valve may rise to admit air, a member adjacent to said valve and having an opening through which the air flows in passing from said valve, the edges of said opening diverging from each other and forming an angle widening in the direction in which the valve moves in opening, and means for admitting a liquid fuel at the vertex of said angle in the path of the current of air flowing through said opening.

950,339. Sparking Device. Thomas H. McQuown, Cambridge, Mass., assignor, by mesne assignments, to Arthur Atwater Kent, Philadelphia, Pa. Filed July 28, 1905. Serial No. 271,583.

1. In a device of the class described, a stationary contact, a rotary member carrying a movable contact which is adapted to engage the stationary contact as said member rotates, means tending constantly to rotate said member forward with an accelerated motion, and a rotary restraining device to restrain the movement of said member until the movable contact is about to engage the stationary contact, said restraining device releasing said member just prior to the time when the movable contact engages the stationary contact whereby the movable contact is accelerated in its movement as it engages the stationary contact.

950,423. Carburetter. Lars Anderson, Chicago, Ill., assignor to Henry S. Morton, Cranford, N. J. Filed Feb. 13, 1909. Serial No. 477,600.

1. In a carburetter, the combination of an air induction passage, a throttle for controlling the air passage, a valve for controlling the supply of liquid to the nozzle, a valve seat with which the valve co-operates, means for adjusting the throttle, and means

whereby the adjustment of the throttle will automatically and simultaneously adjust and rotate the said valve with respect to its seat.

950,615. Automatic Controlling Device for Vehicle Lamps. Henry Ehlen and Charles E. Rudy, Covington, Ohio, assignors of one-third to William B. Meeker, Dayton, Ohio, and said Rudy assignor to said Ehlen. Filed Oct. 30, 1908. Serial No. 460,370.

1. In a construction as described, a vehicle body, a steering apparatus, two pivotally mounted lamps, connections between the said lamps and the steering apparatus including independent radial levers mounted on a common trunnion and adapted to positively control the movement of the lamps, and links extending between the radial levers and the pivotal supports of the lamps, and means to independently actuate the said radial levers by the movement of the steering apparatus whereby one of said lamps will be turned on its pivotal connection in unison with the steering apparatus while the other lamp will remain at rest, substantially as specified.

950,706. Current Distributor and Timer. James M. Smith, Philadelphia, Pa., assignor of one-half to Wilson D. Craig Wright, Philadelphia, Pa. Filed Jan. 13, 1909. Serial No. 472,098.

1. A current-distributor and timer for the ignition system of explosive engines, comprising a casing, an arbor rotatively arranged in said casing, a gear wheel upon said arbor, a gear wheel provided with a hollow hub rotatively arranged in said casing and adapted to mesh with the gear wheel on said arbor, a sleeve slidably arranged in said hollow hub and adapted to rotate therewith, a shaft or spindle connected with said sleeve and adapted to rotate therewith, a make and break device within said casing, means connected with said shaft or spindle for operating the same, a current distributing mechanism within said casing, a spark-coil arranged within said casing, and means for connecting electrically the said spark coil with the said make and break device and said distributing mechanism, substantially as and for the purposes set forth.

950,773. Spring Check. Bernard B. Mears, Baltimore, Md. Filed Nov. 27, 1907. Serial No. 404,111.

1. The combination with a vehicle frame having side bars, an axle, and means for yieldingly supporting the frame above said axle, of a resilient checking member extending transversely of the frame between said side bars, means carried by the side bars for supporting said checking member, and flexible members connecting said checking member and said axle.

950,847. Spark Plug. Samuel B. Fowler, Lafayette, Ind. Filed April 21, 1909. Serial No. 491,287.

1. In a spark plug for internal combustion engines an outer electrode consisting of a hollow body portion terminating in an annular surface, an inner electrode extending through the hollow body portion of the outer electrode and terminating in substantially the plane of the annular surface of the outer electrode, insulating material filling the space between the two electrodes and terminating in substantially the plane of said annular surface, said inner electrode having its end of greater diameter than its body portion whereby a spark gap is secured of less

length than the thickness of the insulating material between the body portions of the two electrodes.

950,848. Gasolene Engine Starter. Edwin A. Gardner, Chicago, Ill., assignor of one-tenth to Christopher Baldacci, Chicago, Ill. Filed July 12, 1909. Serial No. 507,192.

1. The combination with the motor spring surrounding the engine shaft, of said engine shaft, of a ratchet clutch device for connecting at will the inner end of the spring to the shaft for winding the same, a drum surrounding the spring and to which its outer end is connected, a ratchet surrounding the shaft and carried by the drum, and a pawl plate engaging said ratchet and attached rigidly to the shaft, substantially as described.

950,919. Ball Bearing. Henry Hess, Philadelphia, Pa. Filed April 24, 1906. Serial No. 313,443.

1. A separator for balls, comprising two cups, each adapted to engage a segment of a ball so that a line passing through the centers of the cups intersects the ball centers, a spring connecting the cups and tending to move them apart, and a cage inclosing the spring, the cups and cage being arranged so that in some cases the ends of the cage may engage the balls.

950,949. Automobile. Frederick P. Nehrbas, Buffalo, N. Y., assignor to E. R. Thomas Motor Company, Buffalo, N. Y., a Corporation of New York. Filed June 7, 1909. Serial No. 500,519.

1. An automobile comprising a longitudinal bar and a cross bar, a bracket having upper and lower plates which are secured with their inner parts to the adjacent ends of said bars and form gussets while their outer parts are connected by a vertical web and form a pocket, and a spring seated in said pocket.

950,980. Driving Mechanism for Motor Vehicles. Alexander Winton and Harold B. Anderson, Cleveland, Ohio, assignors to The Winton Motor Carriage Company, Cleveland, Ohio. Filed Nov. 30, 1906. Serial No. 345,691.

A driving and supporting mechanism for motor vehicles, comprising a single piece axle having an integral drop center and short integral longitudinally extending spindle sockets to prevent possible shifting out of alignment, hollow longitudinally extending wheel spindles having their inner ends rigidly attached within said sockets and their outer ends projecting beyond the sockets to receive wheel bearings, a compensating gear housing above and detachably attached to the drop portion of the axle by vertically arranged sockets, driving wheels journaled upon the hollow spindles, and separate shaft connections of less diameter throughout their length than the internal diameter of said hollow spindles to permit them to be attached and removed through said spindles, the ends of the shaft sections detachably connecting the wheel hubs and the compensating gearing, substantially as described.

951,000. Spring Controlled Vehicle Wheel Link. Hugh Ewing, Columbus, Ohio. Filed Sept. 28, 1909. Serial No. 519,954.

1. In a vehicle, the combination of a wheel axle, a body, a supporting link for the body carried upon the wheel axle, the link being pivoted substantially vertically over the wheel axle, a pair of springs disposed on opposite sides of the link by which the link is normally maintained in its vertical position.

tion, a bracket suitably mounted for resisting the thrust of the springs, the adjacent ends of the springs abutting against the link and bracket, and a sliding rod for connecting the springs, substantially as described.

951,037. Transmission Mechanism. Alexander Winton, Cleveland, Ohio. Original application filed May 25, 1903, Serial No. 158,714. Divided and this application filed May 4, 1906. Serial No. 315,230.

1. A transmission mechanism comprising a motor, a balance wheel therefor, a transmission mechanism including a clutch member co-acting with the interior surface of the balance wheel, said clutch member projecting beyond the said balance wheel rim, and a reversing mechanism coacting with the outer peripheries of said balance wheel rim, and the projecting portion of said clutch member.

951,070. Shock Absorber. John H. Gibson, Greenville, Pa. Filed Feb. 1, 1909. Serial No. 475,409.

1. A shock absorber for vehicles comprising a cylinder constantly open to the atmosphere at one end and having a head at the other end, a piston in said cylinder, air being allowed to pass from the said open end of the cylinder to the space between the piston and the cylinder head when the piston is moved in one direction, means forming communication between the atmosphere and the space between said piston and said head when the piston is in its normal position, means for automatically closing such communication at a predetermined point in the travel of the piston, and means for regulating the outlet of the air from the cylinder on the return stroke of the piston.

951,093. Method for Gasifying, Igniting and Controlling the Combustion of Fuel. Wolcott Remington, Stamford, Conn. Original application filed Feb. 25, 1908, Serial No. 417,705. Divided and this application filed Oct. 14, 1908. Serial No. 457,739.

1. The method of consuming fuel which consists in first compressing air to such a degree that its temperature is above the vaporizing point of the fuel below the temperature at which the fuel ignites, then injecting the fuel into the compressed air, and finally igniting said fuel at a point beyond the point where it was injected.

951,096. Spring Controlled Vehicle Wheel Link. Hugh Ewing, Columbus, Ohio. Filed Dec. 2, 1908. Serial No. 465,738.

1. In a vehicle, the combination of a wheel axle, a body, a spring controlled supporting link for the body carried upon the wheel axle, said link being pivoted substantially vertically over the wheel axle and normally maintained in said position by its spring control.

Reissue—13,086. Wind Shield for Self-propelled Vehicles. George W. Kerr, West Springfield, Mass., assignor to C. A. Mezger, Incorporated, New York, N. Y., a Corporation of New York. Filed Jan. 17, 1910. Serial No. 538,563. Original No. 812,930, dated Feb. 20, 1906. Serial No. 247,921.

1. A wind shield for vehicles comprising a lower part supported on the vehicle, a brace therefor extending from the upper part thereof to the vehicle, an upper part arranged to swing relatively to said lower part and a brace pivotally secured to the upper part and having a sliding connection with the brace for the lower part.

951,117. Combustion Engine. Charles E. Henriod, Neuilly-sur-Seine, France. Filed June 30, 1908. Serial No. 441,208.

In a combustion engine, an admission valve and an exhaust valve arranged in direct contact with the cylinder and at the side of one another, metal ribs connecting their casings, together to increase the area of contact between the two valves, and two fans having a common axis and supported from the cylinder so that one operates in front of the admission valve and the other in front of the exhaust valve for the purpose set forth.

951,174. Vehicle Brake. Samuel F. Boyce, Schenectady, N. Y., assignor of one-half to Robert E. Powell, New York, N. Y. Filed Dec. 21, 1908. Serial No. 468,617.

1. The combination with an axle of an arm pivotally mounted thereon and provided with an elongated brake shoe, constructed to engage the ground, means for raising said shoe into inoperative position, a spring pressed rod having its end constructed to engage said shoe, and means for moving said rod out of engagement with said shoe.

951,193. Funeral Car. Samuel W. Mather, Cleveland, Ohio. Filed Sept. 10, 1909. Serial No. 517,158.

1. A body for a funeral car, comprising a driver's compartment, two passenger compartments, a transverse casket compartment located between the passenger compartments, and a side entrance into each compartment.

951,235. Coupling for Shafts and the Like. Cysille Cottin, Lyon-Monplaisir, France. Filed Dec. 26, 1908. Serial No. 469,332.

1. A coupling comprising a universal joint, a fly wheel, a driving shaft, with the clutch cup mounted on a driven shaft, said universal joint being formed by providing the clutch cup with an edge which is spherical in section and which rests in a cylindrical-spherical recess of the fly wheel, opposite radial tenons trunnioned in the rim of the fly wheel and having their flattened ends engaging with corresponding grooves cut longitudinally in the spherical edge of the clutch cup.

951,244. Ball Bearing. Henry Hess, Philadelphia, Pa. Filed April 27, 1906. Serial No. 313,975.

A separator adapted to be inserted between two adjacent balls in an annular ball bearing having bearing rings provided with races of curved cross section, consisting of a piece of sheet metal having a web and two flanges, the flanges being notched to engage segments of the balls, and one of the flanges being curved to approximately conform to one of the races.

951,376. Shock Absorber. Frank W. Merritt, New York, N. Y., assignor, by mesne assignments, to Auto-Appliance Manufacturing Company, a Corporation of New York. Filed Feb. 13, 1909. Serial No. 477,493.

1. In a shock absorber, the combination of two discs adapted to be respectively secured, one to the body and the other to the running gear of a vehicle, and placed face to face and held together, one provided with a recess whose wall is in the form of inclined ways, the other with a recess adapted to retain a rotary bearing part, a rotary bearing part interposed between said discs and entering said respective recesses, a clamping device adapted to hold said discs together and a spring interposed

between said clamping device and the disc.

951,533. Attachment for Vehicle Wheels. Gilford E. Kimmel, Rutland, Ind. Filed April 13, 1909. Serial No. 489,607.

In an attachment for vehicle wheels, the combination with a rim of the wheel, of a similarly constructed rim, arms applied to said first referred to rim and having laterally extending recurved portions adapted to receive laterally the second referred to rim, said arms having slots therein extending in the direction of the longitudinal plane thereof, said first referred to rim also having guide loops receiving said arms, a bifurcated cam, a bolt having its stem passing through said cam, means for effecting connections between said bolt and said cam, said cam having a lever member for its manual actuation, and a clamping plate through which said bolt passes, engaged by said cam and itself engaging said arm.

951,555. Clip for Drive Chains. Warren J. Belcher, Hartford, Conn., assignor to Whitney Manufacturing Company, Hartford, Conn., a Corporation. Filed Oct. 2, 1909. Serial No. 520,724.

1. The combination with the pivot pins and side plates of a drive chain, of a clip to fit over the ends of the pins extending beyond the side plates, said clip consisting of a sheet metal body having openings therein to receive the ends of the pins, and a spring tongue to bear against one side of one of the pins to move the clip endwise toward the other pin, and into locking engagement with a groove in said pin.

951,651. Friction Clutch. Van Zandt M. Moore, Cleveland, Ohio. Filed Oct. 3, 1908. Serial No. 456,078.

1. The combination of a driving and a driven member having conical surfaces, one of which is composed of a number of individually pivoted sections arranged in a circuit and means for causing axial movement of said sections as a unit relatively to the other member, and means for swinging the sections individually on their pivots.

951,707. Automobile Starter. Charles A. Smith, Brattleboro, Vt. Filed July 14, 1908. Serial No. 443,517.

1. An automobile starter, comprising a rack provided with teeth at one end, a pedal for moving the rack in one direction, means for returning the rack, a latch for locking the pedal and a spark lever connected with the latch for releasing the same.

951,869. Tire Construction. Paul E. Wirt, Bloomsburg, Pa. Filed Sept. 12, 1907. Serial No. 392,462.

1. A laminated tire having a plurality of thin flexible rubberized fabric sheets cut into predetermined lengths and adhesively compacted in face to face relation, said units being successively compacted and arranged to present their outer edges toward the wearing surface, said laid up laminations being vulcanized together.

951,870. Tire and Tire Tread Construction. Paul E. Wirt, Bloomsburg, Pa. Filed Sept. 12, 1907. Serial No. 392,463.

1. In a tire, the tire body and a separate tread portion on the latter, said tread portion consisting of a plurality of thin flexible forming units constructed from sheet material and adhesively compacted in face to face relation with their outer edges presented toward the wearing surface.

951,871. Tire Construction. Paul E. Wirt, Bloomsburg, Pa. Filed Jan. 13, 1909. Serial No. 472,126.

1. A tire including a plurality of flexible units disposed side by side and crushed in the direction of their width.

951,872. Tire Construction. Paul E. Wirt, Bloomsburg, Pa. Filed Jan. 13, 1909. Serial No. 472,127.

1. A method of constructing tires which consists in building up on the external surface of the tire body a separate tread structure by successively laying tread forming units, of flexible sheet material, on edge and in tightly compacted face to face relation with their outer edges presented toward the wearing surface, and finally vulcanizing the whole.

951,873. Tire Construction. Paul E. Wirt, Bloomsburg, Pa. Filed Jan. 13, 1909. Serial No. 472,128.

1. A tire comprising a body made up of a plurality of layers of flexible material, and individual unconnected reinforcing strands located between the layers and arranged diagonally in said body, said strands consisting of thin soft pliable wires.

951,915. Driving Mechanism for Divided Axles. Charles H. Johnson, Canton, Ohio, assignor to The Ridgley and Johnson Tool Company, Springfield, Ill., a Corporation of

Illinois. Filed June 14, 1909. Serial No. 501,888.

1. A driving mechanism including a divided axle, discs on the axle sections, a driving drum fitting around the discs and having a recess with cam faces therein presented toward the discs, spring controlled rolls in the recess on each disc adapted to be wedged between the cam faces of the drum and the discs by the relative rotation of the drum and discs, and a spacing block between the rolls having a centering plate frictionally held between the discs.

951,984. Means for Controlling Automobiles. Howard E. Coffin, Detroit, Mich., assignor to E. R. Thomas Detroit Co., Detroit, Mich., a Corporation of Michigan. Original application filed Aug. 4, 1906, Serial No. 329,139. Divided and this application filed Aug. 4, 1906. Serial No. 329,140.

1. In a controlling mechanism for automobiles the combination of a steering post, a steering rim to actuate said post, a rotatable shaft to control the throttle valve of the carburetter, a vertically reciprocatory staff to actuate the spark controlling device, means to actuate said shaft, and a hand grip rotatable upon an upwardly extended

axis to vertically reciprocate said staff, the staff and the shaft being movable simultaneously by one hand of the operator or each independently the one of the other at the will of the operator.

## Continental Motors

Continental Type R

A limited number still to dispose of for 1911 business. Last year, we were compelled to disappoint many of our customers. Don't be one of the disappointed this year. Write for descriptive catalog.

24 to 50 H.P.  
A. L. A. M. rating.

TIMES BUILDING NEW YORK

### TO PRODUCE TIRES IN WALPOLE

Five Companies Consolidate and Will Add to Varied Manufacture—Controls a Seamless Process.

Combining several concerns whose products relate directly or indirectly to the automobile trade, a consolidation has been effected of the Valveless Innertube Co., of New York City; the Walpole Rubber Co., Granby, Quebec; the Walpole Varnish Works, the Walpole Shoe Supply Works and the Massachusetts Chemical Co., all three of the latter being located in Walpole, Mass. The new company formed by the consolidation will be known as the Walpole Rubber Co., and will be managed by the men who have been operating the Chemical Company.

In addition to the factories at present in operation in Walpole, Boston and Granby, a new factory is being put up in Walpole, with a floor area of 100,000 square feet. The building is to be completed by August 1, and among other things will be used for automobile tire production. The company controls what is known as the Gleason fusible core process, which embodies the molding of the rubber over a core of metal having so low a melting point that, after vulcanizing the rubber, the metal may be melted and poured out through a small opening. The process gives a seamless result and is used in making tire tubes and horn bulbs.

### Ford Loses the Legal Skirmish.

In the matter of substituting the name of the Columbia Motor Car Co. for that of the Electric Vehicle Co., as complainant with George B. Selden in the decree which is to be entered against the Ford Motor Co., Judge Hough of the United States Circuit Court for the Southern District of New York, filed an opinion on Friday, 22d inst., granting the motion of counsel for the complainants, for leave to file a supple-

mental bill making the substitution. The defendant's time to demur, plead or answer is on or before May 12. The recent hearing before Judge Hough was over the question as to whether an original bill should be filed to make the change in name or whether it might be done by a supplemental bill.

### Pullman "Passes Up" Evansville Deal.

No plant at Evansville, Ind., is to be established by the Pullman Motor Car Co., of York, Pa., despite the fact that complete plans for such a project were made and to some extent carried out. Because of disagreements with the Evansville business men and the further fact that York, the home town of the company, offered ample inducements for the company to stay strictly at home, the required additional factory space will be created in York.

### Here's Another General Motors' Scheme.

The General Motor Securities Co., of New York City, has been incorporated under New York State laws, with \$100,000 capital, its purposes being given as "to deal in Government and industrial securities." J. C. Matlack, of Milltown, N. J., and C. R. Hatheway, secretary of the General Motors Co., appear as incorporators, together with T. S. Merrill, of New Rochelle, N. Y.

### Selden Patent Stops \$1,000,000 Company.

Work has stopped on the erection of an automobile factory for the Corliss Motor Co., of Corliss, Wis., the reason given being that the company has not obtained a Selden license. The concern was incorporated with \$1,000,000 capital last December but indicates that it will not proceed in the face of possible legal trouble.

### Indiana Buggy Makers Trying Cars.

The Kendallville Buggy Co., of Kendallville, Ind., is making plans to take up automobile manufacture. It has completed a five passenger touring car, with a four cylinder Waukesha motor, which is to serve as the prototype for its product.

### PLANS OF UNITED STATES' MERGER

No Stock Jobbing or Scramble for "Units"—Big Truck Plant to be Built in Detroit—Electric Chassis to be Strongly Featured.

In connection with a rapid unfolding this week of the plans of the United States Motor Co., the merger corporation which comprises the Maxwell-Briscoe, Columbia, Alden Sampson and other properties, considerable speculation is being indulged in as to its specific lines of action relating to the taking in of other companies, and future policies as to product and sales methods. The many more or less sensational rumors and bits of guessing gossip in connection with the merger company's intended moves have been quite wide of the mark in most instances, as a disclosure of the company's real plans and purposes is calculated to show, in addition to indicating the aggressive steps that are being taken to strengthen the organization and extend its field of action.

The facts concerning the policy and projects of the big company were supplied by President Briscoe himself during the course of an interview accorded the Motor World on Tuesday last and will set at rest a lot of idle talk. Mr. Briscoe was frank in his utterances and did not attempt to use the language of diplomatic subterfuge.

Reports that various prominent makers, who heretofore have not been identified with United States Motor interests in any way, are about to enter the organization have no basis in fact other than that the big company has adopted an open-minded attitude and is willing to talk matters over with those makers who may be attracted by the United States Motor idea and who feel an interest in the possibilities of alliance with it. To such as appear in the light of elements of strength if they were taken into the fold, the United States

Motor officials are not averse to giving a complete "showdown" of cards, so that the matter may be considered in its every aspect without mystery or concealment.

It is not the intention to add an unwieldy string of companies or acquire any properties that will not be positive factors in the profit-making commercial success of the organization as a whole. The company's plans contemplate no stock manipulation or mere aggrandizement of lists of "constituent" concerns, but look to a closely knit organization in which the individual units and departments will be strong and efficient, with important economies and advantages in purchasing, manufacturing and selling, that are being put into effect by a dominating co-operative administration.

Since the inception of the United States Motor Co. it has been known that the Brush Runabout Co., of Detroit, Mich., is to be numbered with the other concerns in the organization. Frank Briscoe, the head of the Brush company, is a brother of Benjamin Briscoe, president of the merger corporation, and the chief reason that the Brush company has not been taken in already is that other matters have claimed precedence, inasmuch as the understanding has existed from the first. A corps of appraisers it at work this week in the Brush plant, preparatory to the taking over of the property by the United States Motor Co., and it is probable that the deal will be consummated within a week or two.

Detroit is to have another United States Motor plant in a big commercial vehicle factory which the company is to build in that city. The site has been selected and plans submitted for the structure, which will be 1,000 feet long and 150 feet wide, and will have drop forge and blacksmith shops in addition. The exact location of the plant is not yet revealed, because of further real estate transactions involving additions to the site.

The plant will be operated as the Alden Sampson Mfg. Co., Small Car Department, and will make 1,000-pound delivery wagons, together with 1 and 2-ton trucks. The estimated capacity of the factory is 4,000 cars per year at first. Subsequent increases will be made when necessary. Morris Grabowsky, who lately joined the United States Motor forces, will be located at Detroit.

This week the capital stock of the Alden Sampson company was increased from \$300,000 to \$2,000,000, and the United States Motor Co. has put in \$500,000 in cash, which is at the immediate disposal of the Sampson company for carrying forward the enterprises that have been outlined for it. The original plant at Pittsfield, Mass., will be known as the Heavy Service Department. It will continue the manufacture of 3 and 5-ton trucks, but on a much larger scale than heretofore. These trucks will be on the designs developed by the

Alden-Sampson company itself, with such advances and improvements as can be added from time to time. The commercial vehicles to be made at the Detroit plant, however, are the result of designs developed by the Maxwell-Briscoe Motor Co., in the course of some four years of experimentation and test. All the data in the commercial vehicle field that the Maxwell-Briscoe company has gathered in preparation for the time when it might actively engage in this line of manufacture, is to be placed at the disposal of the new Detroit factory.

At the plant of the Columbia Motor Car Co., in Hartford, Conn., there is to be a vigorous rejuvenation of the electric department, in addition to a program which provides for the manufacture of 2,000 gasoline touring cars for the year. The touring cars will list at \$3,000, and will represent the utmost in materials, appointments and de luxe effects.

Something of a departure is to be made in the electric department, in that the company will make and supply complete electric chassis without bodies. These chassis will be furnished to carriage builders and others who may wish to supply the body work and market the complete vehicles in their own way, a large field of this kind having been created by the desire of many carriage builders and carriage dealers to engage in the automobile business in some form. Their special facilities for making bodies to order and for reaching customers of the type who take most kindly to electrics are regarded as favoring the arrangement by which they may become wholesale customers for electric chassis without bodies.

A change is scheduled in Maxwell-Briscoe affairs by the resignation of Benjamin Briscoe as president of the company, to be succeeded by J. D. Maxwell, vice-president and mechanical head. As president of the United States Motor Co., Briscoe will thus be able to give his entire attention to the organization as a whole, and the change will have the further effect of giving the Maxwell-Briscoe company the same sort of representation in the United States Motor company's board of management as the other companies, who are to be represented by their respective heads. The general plans and policies of the Maxwell-Briscoe company, however, remain along the lines already familiar.

Emphasis is placed on the fact that the United States Motor Co. seeks to be an organization in which economy and sound judgment will govern throughout, with no stock jobbing attachments. President Briscoe has indicated that its operations are to be conducted "in the light" and that a governing idea in connection with the organization is that it may be a permanent "estate," the continuance and progress of which will be independent of any man or

group of men concerned in it, so that its policies and institutional character will be such that at no time will an individual be indispensable to its success.

#### Changes Among Prominent Tradesmen.

George S. Patterson has been appointed general manager of the Gaeth Automobile Co., of Cleveland, O. He will assume direct charge of the company's sales.

Marcus Allen has been appointed manager of the New York City branch of the G & J Tire Co., of Indianapolis, Ind. He formerly was the New York manager for the Empire Tire Co.

Gerald P. Hall has been appointed general sales manager of the Pennsylvania Auto-Motor Co., of Bryn Mawr, Pa., making Pennsylvania cars. He formerly was identified with the sales of Midland cars.

Lyman A. Smith, formerly assistant purchasing agent for the Columbia Motor Car Co., of Hartford Conn., has been advanced to the position of purchasing agent. He succeeds F. S. Hyatt, who recently resigned.

C. H. Wallerich has been placed in charge of the sales department of the Haynes Automobile Co., of Kokomo, Ind., succeeding Richard Bacon. Wallerich formerly was with the Willys-Overland Automobile Co. at Indianapolis, Ind.

A. M. Joralemon, who recently resigned as manager of the Pennsylvania Rubber Co., of New York, has become the general sales manager of the Auto Improvement Co., of New York. The company makes speed indicators, taximeters, carburettors and other automobile accessories.

#### Lapeer Drops the Watt Project.

Lapeer, Mich., has changed its mind about giving further help to the Watt Motor Co., of Detroit, Mich., to start a Lapeer plant. The Watt people originally stated that their assets were worth approximately \$26,000, with liabilities between \$13,000 and \$14,000, but that they needed a little ready cash with which to build a demonstrating car. In less than an hour's time a committee of Lapeer business men raised \$3,000 for the purpose. Stock subsequently was sold for a portion of the amount necessary to clean up the company's obligations, but later the promoters stated that an additional liability of \$5,000 for labor had to be taken care of. Following a meeting of the Lapeer men, the company's officers were told that the "deal was off."

#### Krit to Exhibit at Brussels.

The Krit Motor Car Co., of Detroit, Mich., having decided to exhibit at the forthcoming exposition in Brussels, Belgium, has selected Baron Van der Noot de Vrekem de Moorsel, a member of Belgian consulate at Detroit, to represent it. The Baron sails on May 10 with two Krit cars and will be gone six months.

**LOSES THE TRADE-MARK RIGHTS**

**Oil Concern Failed to Mark Brand Name  
On Its Packages—Principle Applies  
to All Kinds of Goods.**

Illuminating an important point concerning trade-mark rights not only in connection with automobile lubricants but in all classes of goods relating to the motor car industry, the United States Circuit Court of Appeals of the District of Columbia has handed down a decision that makes it plain that a trade-mark has no standing in the courts in connection with any articles or goods unless it actually is put on the goods themselves or their containers, no matter how extensively the trade-mark may be advertised or applied to the goods by reference. Two oil companies are the litigants involved, the question being over their rights to "Autoline" and "Autolene," respectively.

In a contest over priority in the adoption and use of the word "Autoline" or "Autolene" as a trade-mark for lubricating oils, the W. C. Robinson & Son Co. was successful over the Crescent Oil Co. in the first decision, it having been shown that the Robinson company secured registration of "Autoline" on November 7, 1905, while the Crescent company filed an application for "Autolene" on February 18, 1908. It was pointed out that while the Crescent company as far back as 1903 had, among thirty different kinds or brands of oil, a brand called "Autolene," the evidence did not show that the name was affixed to or marked upon the packages. In reviewing the previous decision on appeal, the court holds that while the evidence shows that the name was one adopted in the office and warehouse to indicate grade or quality, this is not enough.

The court approves of the principle enunciated in a former case to the effect that property in a trade-mark "can only be acquired by the actual application of it to goods of a certain class" and that "the mere advertisement of the words or symbol without application to the goods themselves is insufficient to constitute a trade-mark." With this view, the finding for the Robinson company by the Commissioner of Patents is sustained.

**To Make Nieuport Magnetos in Muncie.**

The Warner Electric Co., of Muncie, Ind., is to manufacture the Nieuport magneto and ignition devices, under exclusive United States rights granted by the Societe Anonyme des Appareils Electriques Nieuport, of Suresnes, France. The Warner company, as a co-partnership, has been making electrical appliances for ten years, but has recently incorporated with \$100,000 capital for

the purpose of making ignition devices. It will commence the delivery of American-made Nieuport magnetos within 90 days. Among those interested in the concern, whose names are known to the automobile trade, are A. L. Johnson, C. E. Davis, Ray P. Johnson, F. H. Jones, Hugh L. Warner, W. E. Hitchcock, R. C. Stone and J. E. Johnson, all of Muncie, and Edouard Nieuport, of Suresnes. The leading spirits of the group are Ray P. Johnson and C. E. Davis, who hold the positions of secretary and of manager, respectively, in the Warner Gear Co., of Muncie. The experience of the latter firm in the trade will assist the Electric Company's campaign.

**Kelly-Racine Chooses Officers.**

The Kelly-Racine Rubber Co., of Racine, Wis., has completed its organization to the extent of choosing its officers and directors. At a meeting on the 12th inst. the directors were elected, and they in turn selected the following officers: C. F. U. Kelly, president; Frank L. Mitchell, vice-president; Stuart Webster, treasurer, and John D. Dwight, secretary. The board of directors consists of these officers together with Henry Plow.

**Pittsburg Buys a Site at Braddock.**

The Pittsburg Motor Car Co., which at present has a factory at New Kensington, Pa., and makes the Pittsburg Six, has purchased a site in Braddock, Pa., where its manufacturing operations will be transferred upon completion of a three-story factory, 217x95 feet. The company, which is capitalized at \$300,000, some time ago acquired the Ft. Pitt Motor Car Co., of New Kensington.

**Beach Visiting the Foreign Foundries.**

With a view to keeping in touch with foreign methods and improvements in the production of automobile and motorcycle cylinder castings, Edward W. Beach, of the Manufacturers Foundry Co., Waterbury, Conn., is taking a six weeks trip in Europe. He was on the Minnehaha, which went on the rocks in the English Channel, but anticipates a less adventurous return.

**Alpena Accepts Ahern's Offer.**

Agreeing to furnish a ten-acre site and a cash bonus of \$50,000, the chamber of commerce of Alpena, Mich., has accepted a proposition for the building of an automobile factory in that city by Thomas F. Ahern, of Detroit. The latter undertakes to organize with \$150,000 cash capital.

**Remy Opening a Branch in Boston.**

The Remy Electric Co., of Anderson, Ind., is opening a branch distributing office in Boston, Mass. A complete supply of Remy magnetos and parts will be maintained, together with a line of special fittings for attaching Remy magnetos to cars that are not already magneto equipped.

**WHEN RUBBER WILL COME DOWN**

**It Will Be About Three Years Hence, According to Colt—Production Increasing Faster Than Consumption.**

No drop has taken place in the price of rubber for some weeks, and in consequence the purchases of the tire companies and others on this side of the water are as meagre as circumstances will permit. The price of fine upriver Para has been maintained between \$2.80 and \$2.90 per pound. The prices of lower grades are so high that the manufacturers of rubber goods in general have found it necessary to advance prices about 10 per cent. throughout on such products as rubber boots and waterproof articles.

In an interview on the situation, President Samuel P. Colt, of the United States Rubber Co., predicts that, while the end for high prices in rubber is not yet in sight, the present prices cannot be maintained in the face of the vastly increasing production of cultivated rubber, stimulated by speculation in the shares of rubber plantation companies which have been planting enormous areas of land in Ceylon and the Straits Settlements with Brazilian rubber trees.

It will take about three years, President Colt asserts, for this increased production to make itself felt in the market, after which rubber will sell for about half the prices that it is commanding now. The United States uses about 60 per cent. of the entire rubber output of the world, Colonel Colt explains, and automobile tire manufacture takes about half of all that is consumed in this country, or 30 per cent. of the world's output.

"The Bank of Brazil," he declares, "last year started to hold back rubber, in anticipation of a rise which natural conditions brought about. Common labor in Brazil brings \$1.50 per day, against 10 or 15 cents per day in the Straits Settlements, where rubber is obtained from the same species of trees as grow in Brazil. In fact, the trees there and in Ceylon have been transported from Brazil. But production is now increasing faster than consumption and rubber prices ultimately must come down."

**Schedules in Fickling Bankruptcy.**

Schedules in bankruptcy of Fickling & Co., New York City, makers of automobile tops and body fittings, show liabilities \$21,587 and nominal assets \$26,518, consisting of stock \$6,000, office furniture \$1,000, plant \$9,000 and accounts \$10,518. There are chattel mortgages on the stock, fixtures and part of the plant, and of the accounts \$10,917 have been assigned. There are 154 creditors.

**THE WEEK'S INCORPORATIONS.**

Philadelphia, Pa.—Fegley Tire Chain Co., under Pennsylvania laws, with \$5,000 capital.

Detroit, Mich.—Canadian P. F. Motor Co., under Michigan laws, with \$100,000 capital.

Chicago, Ill.—Standard Automobile Station, changes name to Carpenter Automobile Co.

Waynesboro, Pa.—Waynesboro Garage Co., under Pennsylvania laws, with \$20,000 capital.

Detroit, Mich.—Michigan Auto Trimming Co., under Michigan laws, with \$19,000 capital.

Detroit, Mich.—Renfro-Wheeler Mfg. Co., changes name to Renfro Speed-O-Meter Co.

Memphis, Tenn.—Blount County Motor Vehicle Mfg. Co., under Tennessee laws, with \$1,800 capital.

New York, N. Y.—Auto Fabrics Co., under New York laws, with \$20,000 capital. Corporators—Augustus R. Linn, Brooklyn, and others.

Akron, O.—Firestone Tire & Rubber Co., under Illinois laws, with \$4,000,000 capital; to manufacture rubber tires and automobile accessories.

Tulsa, Okla.—New State Auto Co., under Oklahoma laws, with \$10,000 capital. Corporators—Fred J. Shaw, T. A. Wallace, L. H. Ewing.

New York, N. Y.—Motor Rubber Tire Co., under New York laws, with \$9,000 capital. Corporators—W. S. McNabb, Brooklyn, and others.

Sumter, S. C.—Sumter Automobile Supply Co., under South Carolina laws, with \$3,000 capital. Corporators—E. W. Moise, Jr., T. C. Reed.

Chicago, Ill.—Arrow Garage Co., under Illinois laws, with \$10,000 capital. Corporators—Harry A. DeVaux, H. J. Butler, Frank N. Wiley.

Kansas City, Mo.—Nolan-Riske Motor Car Co., under Missouri laws, with \$25,000 capital. Corporators—M. O. Nolan, L. E. Riske, Clara J. Nolan.

Lansing, Mich.—Radle-Clark Sales Co., under Michigan laws, with \$50,000 capital; automobile sales agency. Corporators—R. A. Radle, Frank G. Clark.

Lorain, O.—C. M. Lippert Auto Co., under Ohio laws with \$5,000 capital. Corporators—C. M. Lippert, F. L. and W. A. Pitzela, W. S. and E. A. Baldwin.

Fort Worth, Tex.—Allen Motor Car Co., under Texas laws, with \$15,000 capital; general automobile business. Corporators—J. D. Allen, H. R. Ramey, W. G. Newby.

Worcester, Mass.—Norcross Automobile Co., under Massachusetts laws, with \$2,000 capital; general automobile business. Corporators—J. O. and Maude S. Norcross.

Mayfield, Ky.—Mayfield Automobile Club, under Kentucky laws; no capital. Corporators—T. L. Stovall, W. E. Shelton, R. C. Robbins, H. J. Wright, W. E. Playter.

Port Jefferson, N. Y.—Port Jefferson Automobile Co., under New York laws, with \$1,000 capital. Corporators—Luther H. Chambers, Lewis O. Davis, Joseph B. Skinner.

Chicago, Ill.—Stromberg Electric Co., under Illinois laws, with \$200,000 capital; to manufacture time recording devices. Corporators—K. B. Miller, J. B. Edwards, H. G. Rockwell.

Cincinnati, O.—Auto & Motor Casting Co., under Ohio laws, with \$50,000 capital. Corporators—A. J. Miller, C. H. Gunkleman, William Schaefer, William Baisch, A. G. Applebey.

Cleveland, O.—Cleveland Motor Truck Co., under Ohio laws, with \$20,000 capital. Corporators—G. von der Steinen, W. B. Stewart, F. C. Van Cleef, Edward A. Kline, G. W. Cottrell.

Jackson, Miss.—Central Supply & Automobile Co., under Mississippi laws, with \$10,000 capital. Corporators—Floyd Willis, John P. Hall, C. A. Alexander, James W. Neal and others.

Pittsburg, Pa.—Pittsburg Automobile Academy, under Pennsylvania laws, with \$5,000 capital. Corporators—W. H. Hochberg, Verona; J. G. Murray, H. P. Johnston, Pittsburg.

Chicago, Ill.—Newberry Taxicab Co., under Illinois laws, with \$50,000 capital; automobile taxicab and teaming business. Corporators—Joseph A. McInerney, John F. Clark, Edward V. Peterson.

Detroit, Mich.—Fairview Foundry Co., under Michigan laws, with \$10,000 capital; to manufacture automobile parts. Corporators—F. L. Bromley, J. W. Thompson, C. A. Pfeffer, Hugh Chalmers.

Detroit, Mich.—Oliver Motor Co., under Michigan laws, with \$300,000 capital; to manufacture commercial vehicles. Corporators—Louis W. Schimmel, Charles Bruns, Robert F. Hartenstein, Paul and Henry Wagner.

Ft. Wayne, Ind.—Ft. Wayne Motor Co., under Indiana laws, with \$50,000 capital; manufacturers. Corporators—F. L. Jones, A. D. Cressler, H. D. Scherer, G. H. Loesch, S. S. Bowersox, J. B. Reuss, A. J. Vesey, D. B. Douglass, M. R. Beaver.

New York, N. Y.—Automobile Sales & Distributing Co., under New York laws, with \$10,000 capital; to manufacture and deal in automobile parts, accessories, etc. Corporators—Owen B. Augspurger, George A. Orr, George A. Cochrane, all of Buffalo, N. Y.

**Engine Plant for Fort Wayne.**

Fort Wayne, Ind., has a new motor building enterprise in the Automobile Engine

Co., capitalized at \$50,000 and which is declared to have completed its stock subscription list. The plant will be located in the old Haberkorn engine works, on the east side of town. G. Y. Bowersox, designer of the engine, will have charge of the manufacturing plant.

**Concessions in Carload Minimums.**

Protests of the automobile manufacturers to the railroad rate making committees have resulted beneficially in relation to the westbound shipments over transcontinental lines, a concession having been granted as to the minimum weights on which carload rates shall apply. At present the minimum weights on which a carload rate applies when freight cars 46 to 50 feet long are used, varies from 12,100 to 14,200 pounds, and for 43 feet the lowest is 10,000 pounds. Effective May 23 the minimum will be 12,000 pounds for freight cars 43 to 50 feet, with no change for those whose length is below 43 feet.

**Four New Members in the M. A. M.**

The Motor and Accessory Manufacturers has added four companies to its membership. At the last meeting of the directors the following concerns were admitted: George A. Haws, New York City, oils and greases; Gasoline Motor Efficiency Co., Jersey City, N. J., carburation accessory; Sherwin-Williams Co., Cleveland, O., paints and varnishes; E. B. Van Wagner Mfg. Co. Syracuse, N. Y., die molded castings.

**Detroit Office for National-Acme.**

In order to keep in immediate touch with the Detroit factories, a selling office in that city has been established by the National-Acme Mfg. Co., of Cleveland, O., makers of Acme automobile screw machines and screw machine products. E. G. Matter, who has been with the company for five years in Ohio and Chicago territories, is in charge, the office being at 1222 Majestic building.

**Saurer Trucks in a New Manhattan Home.**

Saurer Motor Trucks will have a new home for its eastern branch as the result of taking a lease on a new six-story fire-proof building at 411-13 West Fifty-fifth St., New York City. The building will be used for shops, stock, storage and garaging of Saurer trucks, although Albert T. Otto will retain the main office in the Motor Mart, at Columbus Circle.

**Colt-Stratton Extends Cole Territory.**

The Colt-Stratton Co., New York City, eastern distributor for the Cole "30," in increasing its facilities has just completed arrangements for two new local representations. G. E. & H. J. Havich is the style of a new concern which is to handle the line in Boston and vicinity. An agency in Wilmington, Del., has been placed with Thomas M. Brown.

## IN THE RETAIL WORLD.

Hugh Squires, Elkhorn, Wis., has sold his garage to Zweibel & Greibel.

W. F. Young, Wichita, Kan., has opened a garage at 247 North Market street. He will handle the Everitt "30."

The Catskill (N. Y.) Supply Co. is having built a new garage. The location is on the Tuttle property on Hill St.

The Selby Co., Washington, D. C., which handles the Paige-Detroit locally, has taken possession of its new quarters at Fourteenth and S streets.

S. A. Lewis, New Haven, Conn., has had plans drawn for a garage on the corner of Orange and Grove streets. It will be of brick, 87x177.

The Morrison Motor Car Co., Chicago, Ill., has established a branch in Milwaukee, Wis. It is located at Grand Ave. and Twenty-sixth St.

The Reading (Pa.) Automobile Co. has taken possession of its new garage at 126-8 North Fifth street. It is the most pretentious establishment in the local colony.

The Standard Motor Car Co., San Francisco, Cal., has opened a branch in Stockton, which will be in charge of F. L. Cutting. Ford and Velie cars will be stocked.

The automobile colony of Topeka, Kan., will be expanded soon with the opening of Bredel Bros., salesroom and garage, at 111 East Eighth avenue. They have the Sterling agency.

Garage facilities in Newark, N. J., are to be still further increased, Igo Bros. having taken a permit for a new garage at Avenue A and Pointer street. The structure will cost \$1,000.

The Black Garage Co., New York City, has leased the garage to be erected at 209-11 East Sixty-fourth St., and will occupy it when completed. It will be a one story building and will cost \$9,000.

Recently formed to market Packard cars in Northern Texas, the Allen Motor Car Co. will make its headquarters in Fort Worth, and now is seeking a suitable location. J. D. Allen heads the company.

Red Bank, N. J., is to have better garage facilities. They will be provided by Fred Van Dorn, who has let the contract for a new garage on Front street. It will be of cement blocks, 50x70, and will cost \$3,000.

The Thomas Automobile Co., Louisville, Ky., has a new home under way which is expected to be ready May 15. It is located at Third avenue and Breckinridge street and will afford greatly increased facilities.

The Pacific Motor Car Co., Oakland, Cal., has opened new salesrooms at 173-5 Twelfth street, and will retain its old quarters on Franklin street for storing surplus stock. It handles the Stevens-Duryea, E-M-F., Flanders and Woods electric cars.

C. H. Hardacker and the Minneapolis

(Minn.) Electric Vulcanizing Co., have joined forces and hereafter will operate from the latter's establishment at 618 Third avenue, south. Tire repairing is their specialty.

Krit cars are to be handled in Washington, D. C., by the Krit Auto Sales Co., just formed, and which will make its headquarters in the Imperial garage, 1214 V street, N. W. Thomas W. Cadick will act as manager.

The University Automobile Co., St. Louis, Mo., has taken a ten years' lease of the garage being erected on Delmar Boulevard, near De Baliviere Ave. The building will be one story, 100x140, and will cost \$20,000.

Brown & Cleary is the title of a new firm which has just entered the automobile business in St. Joseph, Mo., with temporary quarters on South Eighth street. They will concentrate on selling Auburn and DeTamble cars.

This week the Rickey Machine Co., East Orange, N. J., will change its address, and take possession of its new salesrooms on Main street. Greatly increased storage and repair facilities will be afforded in the new quarters.

James H. Rooney, New York City, builder of automobile bodies, has leased the three upper floors of the five story building at 318 West Forty-eighth street. The three floors have a total area of about 15,000 square feet.

Contracts have been let by the Bergdoll Motor Car Co., Philadelphia, Pa., for a large addition to its garage at Broad and Wood streets, to cost \$100,000. The new structure will be 155x73, and will displace several dwellings.

John N. Schneider, New York City, who conducted an automobile renting business at 112 East Seventy-fifth street, has run on financial shoals and filed a petition in bankruptcy. His liabilities are \$41,280, with no tangible assets.

F. C. Reamer and Carroll A. Haines, Philadelphia, Pa., have secured the Quaker City representation for Baker electrics and will open salesrooms at 2214 Spring Garden street. They have leased part of the Park garage for storage purposes.

Philadelphia, Pa., has another new motor concern, which styles itself the Automobile Co. of Philadelphia, and has taken showrooms at 1532 Sansom street, where Marmion cars will be handled. Joseph A. Hudson, a well known local tradesman, is the head of the enterprise.

The Keim Supply Co., Philadelphia, Pa., has taken over the interests of the Auto-light & Motor Supply Co., and will maintain two stores for the conduct of its accessory business. The establishments are located at 1227 Market, and 506-8 North Broad Sts., respectively.

Spokane, Wash., is to have a new enterprise on May 1, when L. O. Cabanne and Frank Cooke will launch a repair shop at 224 Division street, the old home of the Spokane Motor Club. The building has been remodeled and a complete machine equipment installed. Later the firm probably will take on the agency for a car.

Fort Worth, Tex., has a new motor car establishment which has begun business under the style of the Imperial Auto Sales Co., with showrooms at 1212 Houston St. A. R. Cash will be manager of the concern, which will have the state distribution of the Imperial car, made in Milwaukee.

When alterations are completed the Foss-Hughes Co., Wilmington, Del., Pierce-Arrow distributors throughout New England and the Middle states, will occupy for garage purposes the stable building on Gilpin avenue, between Jackson and Van Buren streets. The improvements will cost \$5,000.

A. G. Spalding & Bros., Newark, N. J., are soon to occupy one of the best appointed salesrooms in the state which has been fitted up for them at 845 Broad street, an admirable location, opposite the Central railroad station. The Stevens-Duryea, E-M-F., and Flanders cars will make their home in the new quarters.

Unable to await the completion of the finishing touches, the Electric Vehicle Co., Minneapolis, Minn., has taken possession of its new garage at Hennepin avenue and Fifteenth street. A well equipped battery department is a feature of the establishment, the company devoting its energies to the Hupmobile and Detroit electric.

Twenty-five cars belonging to the Seltzer Motor Car Co., Philadelphia, Pa., and stored at 635 Arch street, were more or less damaged by water, during a fire which broke out in the upper floors on the 16th. The top floors, which were gutted, were used for the storage of woollen goods and it was necessary to flood the building to conquer the blaze.

In temporary quarters since the destruction by fire of its old garage at 717 Hennepin avenue, the Royal Auto Co., Minneapolis, Minn., now is permanently located in its new sales and garage building at 517-21 Second avenue, where much additional "elbow room" is gained. Royal Tourist, Abbott-Detroit and Glide cars comprise the concern's line.

Ground has been broken for the new building of the Electric Carriage & Battery Co., Minneapolis, Minn., at Twelfth street and Hermon place. It will be a four-story brick structure standing on a plot 66x165, and is expected to be ready for occupancy July 1. It will be devoted to electric vehicles exclusively, and will be the home of Rauch & Lang cars.

Some Features of the

# White Gasoline Car

which result in unusual  
**Economy of Up-Keep**

The White gasoline car is designed and built to run at a lower cost of up-keep, mile for mile, than any other car on the American market. Some of the factors which insure economy both in fuel consumption and in cost of maintenance are:

### **Intake Gases Heated**

By including the intake passages within the block engine casting, the intake gases are heated. As a result, every particle of gasoline is completely vaporized and each cylinder receives a uniform mixture of the proper richness, thus ensuring very low fuel consumption.

### **Exhaust Gases Cooled**

By water-jacketing the exhaust passages, the temperature of the exhaust gases is reduced as soon as they leave the cylinders. As a result, the pressure of these gases is greatly reduced and there is a minimum loss of power due to back pressure. This factor also results in low fuel consumption.

### **Four-Speed Transmission**

The direct drive is on third gear and practically all driving in town is done on this gear. For high-speed running, the fourth gear is used. There is, therefore, no racing of the engine and no undue strains upon it when the car is run at high speed. Furthermore, the engine may always be run at very close to its most economical speed.

### **Valve Mechanism Enclosed**

There is no chance for dirt and grit to work their way into the bearing surfaces and cause wear and faulty timing, as is the case when the valve mechanism consists of a series of external and unprotected springs, rocker-arms, push-rods, etc.

### **Accessibility of Every Working Part**

The cost of making an ordinary adjustment on any car is determined largely by the accessibility of the several parts. In the White, accessibility has been developed to a much greater degree than in any other car. For example, as there are no external manifolds, or no overhead valve contrivances, a valve may be removed for regrinding without removing or disturbing any other part. As another example, the magneto and water-pump are on opposite sides of the engine and are driven independently, so that either may be reached without disturbing the other.

#### Why Not Stop the "Horse Trots?"

What evils may result from too "promiscuous legislation" of the sort at which Mayor Gaynor, of New York City, was moved to protest in a recent utterance, aptly is illustrated in the attempt to secure legislative sanction for the exclusion of motorists from a single stretch of the public parks which long has been regarded as sacred to the use of a limited group of horsemen. "There is too much of this promiscuous legislation," declared the Mayor with characteristic vigor. "Everybody in the city government runs up to Albany to get a bill to suit himself."

In this particular instance, a city official is credited with the responsibility for a measure which, should it become a law—and stranger things have happened than that it should be sneaked through even at this late day—would be of far greater general than specific effect. The Schultz bill, which now is under consideration by the

Senate, not only would permit the exclusion of automobiles from the Ocean Parkway, Brooklyn, but would permit their exclusion from such other thoroughfares as the Riverside Drive, Seventy-second street West, and certain other arteries which fall under park jurisdiction. The most astounding thing about it is not that an attempt is being made to secure legislative sanction for the exclusion of automobiles from certain sections of a great park system, but that the attempt should be made in the interests of a mere handful of horsemen. The manner in which for many years they have been permitted to hold "horse trots" on a public highway to the inconvenience of every one else using it, is a disgrace to the city of New York; it is provincialism unworthy of a great city and it is time it was stopped. Instead of the bill now in the legislature, there should be one putting an end to the "countryfied" "horse trots," and efforts should be bent in that direction.

So quietly were the initial moves made in attempting the passage of the bill that few were aware of its existence. It is such a common custom to run up to Albany and "start something" in the way of a bill, that nobody pays much attention unless an alarm is sent out. In this case, had it not been for the vigilance of a group of Long Island clubmen, the bill which would permit one city official to prohibit motorists from using not one, but practically all of the decent thoroughfares which lead to Coney Island, should such a course happen to strike his fancy, might have become a law without so much as a single voice being raised in protest until the harm was done.

#### Vacuum Cleaners for Garage Use.

With the rapidly increasing use of the vacuum process for purposes of renovation in practically all lines, it is somewhat surprising that garagemen have not been more quick to see the advantages of applying it to their own line of work. In all metropolitan establishments and in many others which are located in wide-awake and progressive communities, considerable capital in a business way is made of the good care which patrons' cars receive while under cover. Special appliances and conveniences of one sort and another, portable burnishing outfits, portable gasoline and oil service systems, turntables, duplicate elevator service and other devices are employed not

only to facilitate and cheapen the labor of caring for the machines, but also with a direct eye to the psychological impression which an up-to-date equipment always inspires. Nor has it proved that the installation of any amount of special equipment is in any sense a poor investment in the long run but quite obviously to the contrary.

No phase of the garage problem is calculated to make a direct appeal to the customer than that which concerns the maintenance of the finish and equipment of the car in the best possible condition. Especially with the growing use of limousine and town car bodies, in summer as during the months of prevailing inclement weather, is it important that interior as well as exterior finish should be preserved with painstaking care. And it is safe to say that no quicker or more effective way of renovating the upholstery of a car which has come in dusty from the road exists than in the use of the vacuum cleaning process. Compressed air, which is available in all garages, of course, can be used for the purpose. But it possesses the defect of stirring up quite as much dust as it scours from the interstices of cushions and linings. As being free from this objection, flexible in its application, and also as being an essentially modern system and one much before the public through its wide use, it would seem, therefore, that vacuum cleaning apparatus in some form should be installed in every garage which pretends to unimpeachable service and caters to discriminating patronage.

#### Raw Material and Its Delivery.

Without combating the suggestion that important improvements are possible in the conduct and administration of even the best and most representative automobile factories, looking to more exact economy and more accurate knowledge of costs, it is proper to remark that the motor car makers have developed some phases of manufacturing in a way that is unexampled and which brings into recognition certain business truths and principles that heretofore seemingly have been discerned only imperfectly. The so-called "production engineers" and "factory experts" who have been brought into contact with the automobile industry, in addition to finding plenty to criticize, have had their eyes opened to ideas which well may be extended

to other fields of trade and industry.

In a general way manufacturers in all lines try to have their materials arrive in about the proportions and at the rate at which they are to be utilized and made up into the finished product. In some lines of manufacture this is easier than in others, but it is common practice for factories to have large stores of metal, wood or whatever else their raw materials may be, lying useless for weeks and months in advance of the actual need for them. Sometimes these big quantities represent speculation or precaution against future advances in prices of materials, the probabilities of advance being carefully calculated as against the value of the use of the money which they represent. Most manufacturers, however, regard it as good, sound policy to have plenty of material in advance, and contemplate with equanimity the inert masses of raw stuff with which they supply themselves far ahead of their immediate requirements.

Automobile manufacturing, through pressure of circumstances and the imperative need for maximum production in every factory, has not become subject to this sort of pre-provision at all. In fact, the piling up of materials or parts much in advance of the time when they are to be used is calculated to strike horror to most automobile producers. The ideal of the latter is to have everything come in so that it may move from the receiving platforms directly to its use, with as little intervening storage or waiting as possible.

Equally or more upsetting is the tardy arrival of materials that are wanted, because it directly delays production and because it disturbs the delicate balance by which the whole inflow of materials is governed. The tardy arrival of one class of materials means rapidly increasing and temporarily useless surpluses of others that are coming in on time.

The automobile purchasing departments proceed on what might be termed a "hand-to-mouth" basis, so far as materials are concerned, but this characterization applies rather to the physical presence of the materials themselves than to the arrangements for their purchase and delivery. Such arrangements are made far in advance and are safeguarded by contracts and such other means as will insure their being carried out in accordance with the buyer's wishes.

## COMING EVENTS

April 30, Philadelphia, Pa.—Quaker City Motor Club's third annual roadability run to Atlantic City.

May 3, Trenton, N. J.—Trenton Automobile Dealers' second annual 300 miles endurance run.

May 5-7, Richmond, Va.—Richmond Times-Despatch endurance run.

May 5-7, Atlanta, Ga.—Opening spring race meeting on Atlanta motordrome.

May 7, Chicago, Ill.—Chicago Automobile Trade Association's floral parade.

May 9, Santa Rosa, Cal.—Santa Rosa Automobile Association's second annual road race.

May 9-11, Harrisburg, Pa.—Motor Club of Harrisburg's fourth annual reliability contest.

May 10-11, New York City—Motor Contest Association's reliability contest to Atlantic City and return.

May 11, Birmingham, Ala.—Birmingham Police Relief Association's race meet at state fair grounds.

May 13, Denver, Colo.—Automobile races at Overland Park.

May 13-14, New York City—Motor Racing Association's 24 hours race at Brighton Beach track.

May 14, Kansas City, Mo.—Automobile Club of Kansas City's hill-climb on Dodson hill.

May 14, Vicksburg, Miss.—Vicksburg Automobile Association's hill climb on Mackey's hill.

May 15, Santa Rosa, Cal.—Santa Rosa Automobile Association's race meet.

May 18, Cheyenne, Wyo.—Cheyenne Motor Club's race meet on motordrome.

May 18-19, Norristown, Pa.—Norristown Automobile Club's third annual endurance run to Scranton and return.

May 19, Chicago, Ill.—Chicago Motor Club's second annual demountable rim test.

May 19-21, Hartford, Conn.—Automobile Club of Hartford's All-Connecticut reliability contest; 600 miles.

May 21-22, Brooklyn, N. Y.—Crescent

Athletic Club-Long Island Automobile Club amateur touring contest on Long Island for Pardington trophy.

May 21-22, Memphis, Tenn.—Automobile races at Tri-State fair grounds.

May 22, Fort Worth, Tex.—Fort Worth "Star-Telegram" endurance run.

May 25, Columbus, O.—Columbus Automobile Club's reliability run to Indianapolis, Ind.

May 27, 28 and 30, Indianapolis, Ind.—Grand Circuit meeting and national championship races on Motor Speedway.

May 27-31, Washington, D. C.—Washington "Post" five days endurance run to Richmond, Va., and return.

May 28, White Plains, N. Y.—Amateur Automobile Contest Association's hillclimb.

May 28-31, Syracuse, N. Y.—Central New York inter-club relay run.

May 29-30, San Francisco, Cal.—San Francisco Motor Club's two days race, meet at Tanforan.

May 30, Denver, Colo.—Denver Motor Club's road race.

May 30, Briarcliff Manor, N. Y.—Amateur Automobile Contest Association's hillclimb.

May 30, Denver, Colo.—Denver Motor Club's annual road race.

May 31, Atlanta, Ga.—Start of second annual New York-Atlanta Good Roads Tour, ending in New York June 7.

June 1, Berlin, Germany.—Start of Prince Henry tour, finishing at Homburg on 8th.

June 2, New York City—Annual Orphan's Day outing at Coney Island.

June 6, West Haven, Conn.—Yale Automobile Club's third annual hill-climb on Shingle hill.

June 4, Worcester, Mass.—Automobile Club of Worcester's annual hillclimb on Dead Horse hill.

June 4, Newark, N. J.—New Jersey Automobile and Motor Club's 280 miles reliability run.

June 11, Portland, Ore.—Portland Automobile Club's annual road race for Wemme Cup.

June 11, Wilkes-Barre, Pa.—Wilkes-Barre Automobile Club's annual hill climb or Giant's Despair.

To speed the tardy materials and retard those which are arriving too fast, the automobile makers employ not only letters, telegrams and long distance telephones, but have their parts chasers right in the field to apply the spurs or draw the reins, as the case may be. In this way the receipt of materials is adjusted exactly to the output.

Despite all complaints as to the expense incident to such methods, the automobile

manufacturers have been able to show production results which are more than amazing to manufacturers in other lines. The proportion of gross annual output to capital and equipment is so immense in automobile manufacture as to challenge the attention of business thinkers and to give importance to the principles underlying such rapid turnover in contrast to the more general method of large advance stocks of material.

**VICTORY FOR "SECOND" OFFENDERS**

**New York's Court of Special Sessions Refuses to Recognize Previous Offences—Whitman Devises New Expedient.**

By an opinion of the Court of Special Sessions of New York City, rendered on Tuesday of this week, the long standing conflict between the court and the District Attorney's office in regard to the prosecution of second and third offenders for violation of the speed law was brought to a head. In consequence, it is rendered impracticable to enforce that section of the existing speed law which provides for the infliction of increasing penalties for repeated infractions.

The decision is important in its bearing upon a bulky accumulation of suspended sentences, but is not likely to be of lasting effect, as the provision covered by it has been stricken out of the proposed law which is now under consideration by the Senate.

When District Attorney Whitman took office on the first of the year he inaugurated the policy of investigating the records of all speed violators who came before the court and of adding to the offense by charging previous convictions where such convictions existed. Since January 11, it is said, there have been 82 convictions on second offenses and 14 on third offenses, in 74 of which sentence was imposed. At the same time there have been no less than 239 cases of suspended sentences out of all cases tried.

Three cases, which were disposed of on Tuesday, resulted in a threat on the part of the District Attorney to bring charges of abuse of discretion on the part of the court to the Appellate Division, and also to announce his intention of appealing to the Legislature to pass a law restraining Special Sessions Judges from suspending sentence in cases where defendants have been convicted previously.

Henry B. Guthrie, Walter Reppin and Robert Sherman, three chauffeurs, were each charged in a formal information filed in court with a second offense. Against the protest of the prosecuting attorney, the charges were ignored and the defendants were allowed to plead as first offenders, although each had been previously convicted, it was alleged.

Judge Olmsted, in rendering the opinion of the Court, holds that the only offense that can be tried in Special Sessions is the one certified by a magistrate, and there is no authority for the District Attorney to add to the offense by making an allegation that the defendants had been previously convicted. He contends that the charge of a second offense cannot be maintained in Special Sessions by informations,

which are in the nature of indictments, unless it appear by the record that the defendants at the time of arrest, when arraigned in a magistrate's court, were charged with being second or third offenders.

An added chapter to the controversy is furnished by the District Attorney's nimble method of circumventing judicial objection in an attempt to force a conviction for second offense. The first offender to feel the effects of the clash was one Warren Watson, a chauffeur, who was arrested on April 25 for speeding. The records show that a Warren Watson of 81 Madison avenue, Hartford, Conn., was fined \$5 in Special Sessions on October 16, 1909, for a similar offense. Watson, who had been held in \$1,000 bail by Magistrate Butts, is unable to furnish bonds and will have to remain in the Tombs until the District Attorney can produce the policeman who made the first arrest. If the policeman can identify him as the Warren Watson he arrested last year, a charge of speeding as a second offense will be made before a magistrate, and the case will be carried before Special Sessions in that form.

**Another "Automatic" Speed Proposal.**

That hoary old project of compelling motorists to equip their cars with an automatic regulating device which will prevent overspeeding, has bobbed up again—this time in New York City. Its latest appearance is in the form of a paternal recommendation which was handed out in the annual report of the Board of City Magistrates. It is said of the automatic device which the magistrates had in mind at the time the report was drawn, that it is so planned as to short-circuit the ignition of a gasoline driven car the very instant that the speed of the vehicle exceeds the law's allowance. But lest an unkind public should suppose that any personal motives were involved in the fostering of such a scheme, it has been permitted to be known that the patent covering the system, application for which has been made, is to be presented to the city gratis just as soon as it is issued. The magistrates' report also touched upon the smoke nuisance, a recommendation being set down that the ordinance at present in effect in the parks should be extended to cover the entire city.

**Curbing Motor Riding Graft.**

The habit of hiring automobiles for official inspection services on the part of city officials, and charging the hire to the city treasury, is receiving severe setbacks in more than one municipality. Mayor Gaynor, of New York, was the first to object to this "extravagance," and now Mayor Seymour of Orange follows in his footsteps. The Mayor struck the amount of \$13.50 from a bill presented to him, because the item represented the hiring price of a motor car for school inspection.

**MIGHT EXCLUDE CARS FROM PARKS**

**Dangerous Bill Before the Senate at Albany—Invented for Ocean Parkway Horsemen—Its Broad Powers.**

Concealed under the innocent guise of an amendment to the New York charter in the matter of park regulation, a bill has been slipped into the Legislature which threatens the liberty of motorists in the use of the public parks and is directly intended to legalize the continued exclusion of motorists and others from the old half-mile speedway for trotting horses on the Ocean Parkway boulevard in Brooklyn. Although framed for a specific and limited purpose, the measure, if permitted to become a law, would place in the hands of park commissioners the power to exclude motor vehicles from any portion of any thoroughfare under their jurisdiction. The pertinent section of the bill, which already has passed the Assembly and was introduced into the upper house by Senator George M. S. Schultz.

And each commissioner shall have power to regulate and prohibit the use or occupation of any street, public place, park, parkway or boulevard, or any portion thereof, under his jurisdiction, by any particular class of vehicles.

Michael J. Kennedy, superintendent of parks in the Borough of Brooklyn, is credited by those who have subjected the bill to close analysis with being the inductive force back of the measure. By the same persons it is pointed out that the interests of the Parkway Driving Club, an association of horsemen, are those it is intended to serve. At the same time, it is indicated that, should the bill become a law, it would effect a serious precedent enabling other commissioners to exclude motorists from their domains in almost any way they might see fit.

The Long Island Automobile Club has taken alarm and is prosecuting a vigorous fight against the Schultz bill. The efforts of the Licensed Automobile Dealers' Association of New York have been enlisted and circulars and copies of the bill sent out to some 25,000 motorists who are numbered among their customers. Considering the approaching termination of the present legislative session, it is hoped that the bill may be killed. A hearing before the Senate is to be held to-day (Thursday).

**Fewer Arrests for Speed Violation.**

Indicating better observance of the speed law, the published records of arrests for violations of the automobile statute show a considerable dropping off for last year as compared with 1908. The total number of prisoners arraigned during 1909 was 158,999, while 1908 placed 186,780 such cases on the record books.

## "SOMETHING DOING" IN NEW JERSEY

Investigation of Automobile Department  
Uncovers Things—"Complimentary"  
Certificates Issued and Some

Startling revelations of the alleged mismanagement and inefficiency of the New Jersey Motor Vehicle Department under the administration of John Blair Reilly Smith, as contained in the State Auditor's report of his examination of the office, came to light last week when Governor Fort transmitted a copy of the report to Secretary of State Dickinson, who exercises jurisdiction over the automobile department. The auditor's report, which covered a most extensive and minute examination of the affairs of the department, brought to light a state of chaos and disorganization almost beyond belief, and which, if true, calls for an immediate shaking up of the organization of the automobile department.

Some of the more important shortcomings of Commissioner Smith in the conduct of his department, as contained in the State Auditor's scorching arraignment, are the failure properly to organize his department and keep in close touch with its affairs, the loose and unbusinesslike handling of its finances, laxity by State inspectors in the performance of their duties, the issuance of complimentary registration numbers to favored ones, the use of receipts for personal purposes, the unlawful expenditure of state money not provided for by law and several other disclosures of a similar nature. Preparatory to making a full and complete defense of the charges Commissioner Smith has issued a brief statement denying in large measure the allegations against his department and characterizing them as inspired by political animus on the part of Governor Franklin W. Fort.

During the last session of the legislature Governor Fort sought to have the office of Motor Vehicle Commissioner separated from that of the Secretary of State, but was unsuccessful, and it was alleged by party leaders that his action was inspired by a desire to appoint to the office a man friendly to him. In this connection it is said that the Governor and Smith "do not speak as they pass by." Smith holds a dual office, for in addition to being head of the motor vehicle department and drawing a salary of \$1,500 yearly, he is also assistant secretary of state, an office which nets him \$3,500 more per annum. That arch enemy of motorists, Senator Frelinghuysen, although in possession of the knowledge contained in the report made no effort to bring about a change in the office, but on the other hand fought desperately but unsuccessfully to

secure the passage of measures desired by Smith, and which provided for an increase in salary for himself and assistants and the appointment of more inspectors for his department.

There are eleven specific counts in the indictment of the state auditor against the automobile department, a few details of which are cited. It is alleged that a personal check for \$30 drawn by Smith was carried for a year in the cash drawer of the department at his orders, and the auditor implies that the cash which it represented was being used for personal purposes. Smith claims that the money was lost or mislaid by a stenographer and that he personally made it good until it could be accounted for. Another charge is that an inspector retained collections for three years before turning them in to the state, and that in numerous instances state money was deposited by inspectors and deputies with their private bank accounts instead of under a separate account.

Registrations were found marked "Gratis" and "D. H.," meaning "Dead Head," and Commissioner Smith while admitting that some complimentary registrations were issued, defended them on the ground that they were given to volunteers and unpaid agents of the department who had rendered valuable services. Apropos of this procedure, one of Commissioner Smith's inspectors alleges that last summer an application for registration came from Governor Fort without the usual fee and that Commissioner Smith ordered it sent without demanding the fee in advance. It is said that nothing more was heard of the matter until last December when the money, \$10, was received shortly before the investigation began.

Although severely criticizing the department for inefficiency State Auditor Drake in his report takes pains to state that there were found no evidences of dishonesty, but that the methods and "system" in vogue strongly tended to induce irregularities.

### Would Use Automobile Fines for Roads.

Partial success has attended the efforts of those who are striving to wrest from the Massachusetts Highway Commission a portion of the funds which it derives from the penalties imposed on violators of the speed law. The committee on roads and bridges has reported favorably the Haigis bill, which provides that 20 per cent. of the money, after the expense of collecting has been deducted, may, upon request of the selectmen of towns, be expended for repairing, improving, constructing and maintaining town roads not state highways. The recent attempt of Mayor Fitzgerald of Boston to secure 50 per cent. of the automobile funds for the Metropolitan Park Commission and City Park Board has failed, as has his effort to secure the exclusion of automobiles from all parks, pending the passage of a bill which would

accomplish the desired end. Opposition, said to have originated in the highway commission, caused the temporary withdrawal of the mayor's bill. Boston members of the legislature now intend to try to have the city included in the division under the Haigis bill in order to obtain some of the 20 per cent. allowed to towns.

### Universal Lights Bill at Washington.

Following quickly on the heels of a bill requiring universal lights, which was reported favorably in the Massachusetts legislature a short time ago, a similar bill has been introduced by Senator Gallinger and Representative Smith, of Michigan, chairman, respectively, of the Senate and House Committee on the District of Columbia, in the National Congress. Under the terms of this bill the Commissioners "are authorized and directed to promulgate from time to time, and amend the same, police regulations requiring all automobiles, horseless and motor vehicles, bicycles, or horse-drawn vehicles, to carry such light or lights on the front sides or rear thereof, between darkness and daylight, as they may deem expedient, and to provide penalties for the violation of such regulations." It is expected that the passage of such a bill in the National Congress will have a material influence in compelling the passage of similar bills in the various state legislatures.

### Must Halt if the Trolley Stops.

While some of the states of the Union on different occasions have endeavored to pass regulations regarding the passing of trolley cars by automobiles, no hard and fast rules have been formulated so far. All that is required of the motorist is that he "slow down and, if necessary, come to a complete stop," when passengers are descending from a trolley car directly ahead of his automobile. In Stuttgart, Germany, the traffic police did not need state permission to pass a much more stringent rule. According to an official announcement, hereafter "all vehicles, automobiles, motorcycles and bicycles must halt and remain motionless at the officially designated stopping places for trolley cars, as long as a trolley car is taking on or discharging passengers." Excuses for not stopping will not be accepted by the police. The "officially designated stopping places" are about two or three blocks apart and furnished with easily visible colored signposts.

### Inadvisable Lubricant Changes.

Experience teaches that it is a great mistake for the average motorist to experiment with various and unknown brands of lubricant for the engine. In most instances it is better economy to pay a good price for an oil which is recommended by the manufacturer and his agents than to attempt to reconcile the motor to oils which, being of a different consistency and fire test, require totally different conditions of service.

**VARIETY IN THE GLIDDEN PATH**

**Route Makers Find Roads That Are Good,  
Bad and Indifferent—Many Escorts  
on the Journey.**

Escorted by over a hundred cars, the Chalmers-Glidden pathfinding car and its crew rolled into Dallas, Tex., on Tuesday night, 26th, having covered 1,253 miles since

plugging through mud and water for days at a time it well can be imagined with what delight the trail blazers welcomed the good roads of Arkansas and the mileage of Friday, 22nd, indicates that they made the most of the good going. On that day the longest run since starting was made, the 175 miles between Helena and Little Rock being covered, and the latter place was the night stop. A detour of five miles was made at Clarendon owing

very heavy going in the Red River bottoms, and found a bridge washed away at Sandy Burdock creek. This day's run was one of the most trying of the trip on account of the bad roads, and the night was spent at Texarkana, Ark. A delegation of Fort Worth, Tex., motorists came out 265 miles to welcome the pathfinders.

After the strenuous run of the day before the scouts took it easy on Monday, and spent half a day logging the route.

WET PATHFINDING—ONE OF THE MANY FORDS ON THE GLIDDEN TOUR ROUTE

leaving Cincinnati two weeks before. Dallas will be the most southerly point touched by the Gliddenites as well as the halfway mark. After leaving Memphis, Tenn., and crossing the Mississippi River the scouts encountered better roads and made faster

to high water in the White River, but after the ferry was crossed, fast time was made. As on the preceding day, the local motorists acted as guides all the way

After leaving little Rock the pathfinders found much activity in road building, a

crossing over into Texas and halting at Paris, the mileage for the day being 92. Some of the best roads of the tour were found over the prairies on Tuesday, 27th, and heading a large cavalcade of members of the Dallas Automobile Club, who had

DRY PATHFINDING—A CONTRAST IN ROADS ON THE SOUTHERN LEG OF THE TOUR

progress, although the lack of bridges still was noticeable.

Accompanied by a delegation of Memphis motorists, who showed the way for the entire day, the pathfinders made Helena, Ark., on Thursday, 21st, an easy run of 62 miles and spent the night there. After

gang of 300 convicts being at work at one point between that place and Hot Springs. Beyond the completion of the first 1,000 miles of the journey the day's run of 102 miles was uneventful, and the night was spent at Daleville, Ark. On Sunday the scouts struck into the southwest and encountered

kept the scouts company for two days previous, they rolled into the Queen City of the Lone Star State. Seven hours were occupied in making the 123 miles journey. The second half of the trip was begun on Wednesday, the pathfinders invading the wilds of Oklahoma.

## SACRAMENTANS HOLD A HILL CLIMB

Harvey, in a Rambler, Wins Double Honors—Four Successful Events Run on a One Mile Incline.

L. B. Harvey, driving a Rambler car, was the star performer at the first annual hill climb of the Sacramento (Cal). Automobile Dealers' Association, held at Folsom on the 17th, and bagged the two major events on the card, including the free-for-all class, which he won in 1:51½, the best time of the day. C. O. King put a Maxwell in second place with 2:00¾ to his credit. Harvey's other victory was scored in the \$2,000-\$3,000 class, when he again outfooted a formidable field, and took first by a safe margin in 2:00¾. E. H. Harvey, piloting a Winton, captured second in this division, dusting up the mile incline in 2:07 flat. Horace Arnold sent his Pope-Hartford to the summit in 2:10½, and was placed third.

As the first automobile contest ever held in that section, it was but natural that the event should assume an overshadowing prominence in local circles, and over 2,000 enthusiasts wended their way to the course, the ideal weather contributing largely to the success of the function. The hill, which is situated in the heart of the town is a mile long, with a grade ranging from 8 to 15 per cent., and includes two sharp turns which bothered the drivers somewhat. The card consisted of four events, all excepting the free-for-all being arranged on a price basis.

In the opening dash for cars costing under \$1,250, Halsey Smith, in an E-M-F., scored an easy win, topping the hill in 2:02¾, and beating C. B. Jones's Overland by 16 seconds. W. J. Mannix, Buick, was third. One of the most exciting and uncertain battles of the day occurred between C. O. King, Maxwell, and Halsey Smith, E-M-F., in the running of the \$1,251-\$1,500 class. King made the run in 2:00¼, which earned him the victory, and Smith was but ¼ of a second behind him. E. C. Turner, in another Maxwell, ran third.

After Harvey's decisive win in the high priced division, the feature number was called, and was open to all previous winners. Harvey then undermined all previous figures, as told, and King ran a good second.

The summaries

Cars Costing \$1,250 and Under.

1 Halsey Smith, E-M-F.....	2:02¾
2 C. B. Jones, Overland.....	2:18½
3 W. J. Mannix, Buick.....	2:22¾
4 Harold Moncur, Hupmobile.....	2:43
5 W. Leitch, Regal.....	3:42½

Cars Costing \$1,251 to \$1,500.

1 C. O. King, Maxwell.....	2:00¾
2 Halsey Smith, E-M-F.....	2:01½

3 E. C. Turner, Maxwell.....	2:24½
4 R. L. L. Skinner, Mitchell.....	2:27
5 D. Leitch, Regal.....	2:35¾

Cars Costing \$2,000 to \$3,000.

1 L. B. Harvey, Rambler.....	2:00¾
2 E. H. Harvey, Winton.....	2:07
3 Horace Arnold, Pope-Hartford..	2:10¾
4 A. E. Leitch, Dorris.....	2:18½

Free-for-All.

1 L. B. Harvey, Rambler.....	1:51½
2 C. O. King, Maxwell.....	2:00¾

### Amateurs Complete Contest Plans.

With the laying out of the route and the framing of supplementary rules which in conjunction with the contest rules of the American Automobile Association will govern the competition, the last details of the amateur inter-club challenge run between the Crescent Athletic Club and the Long Island Automobile Club of Brooklyn, N. Y., for the Pardington trophy, which will take place on Long Island roads on May 21-22 have been completed. The affair is distinguished by reason of the fact that it is strictly an amateur affair, in which striving for cash will have no place, and is likely to show the way for others of the sort which are to be encouraged.

Leaving Prospect Park plaza, Brooklyn, on the 21st, the course will lie through Blue Point, the noon stop being at Easthampton, and returning to the starting point by way of Riverhead and East Quogue, a total of 140 miles. On the second day 110 miles will be covered, passing through Mattituck, Smithtown, the noon stop, Port Jefferson, Jericho and the Crescent A. C. country house. Cars must be entered and driven by amateurs; all professional chauffeurs being barred.

### Distribution of Spoils at Los Angeles.

Surprising though it may appear at first glance, it is a fact that the drivers of the largest and fastest cars at the recent Los Angeles Motordrome meet did not carry off the biggest prizes, although most of the top notchers were well remunerated for their work. Ray Harroun, who was one of the star performers during the speed carnival, captured the biggest portion of the spoils, the net proceeds of the meet being four trophies and \$1,975 in cash. The other drivers shared in varying degrees, as follows: Barney Oldfield, \$1,025 and two cups; Ralph DePalma, \$875; Joseph Nickrent, \$600 and two cups; Al. Livingston, \$400 and two cups; George Robertson, \$500; Ben Kirscher, \$200; Bill Endicott, \$225; J. B. Marquis, one trophy and \$275; Frank Siefert, \$162.50; Frank Lescault, \$150; Scott Wade, \$125; Rober Stearns, one cup and \$75; Harris Hanshue, one cup and \$25. Caleb Bragg, who, being still an "amateur," despite the fact that he competed with professional drivers, and, who, therefore, cannot accept cash remuneration, has indicated that he will take a trophy, two shields and sundry jewelry as his compensation.

## HAS SET HIMSELF A LONG JOURNEY

Trade Tourist to Go Completely Around the Country's Border—Car Has Covered 4,000 Miles Already.

Transcontinental trips which generally are regarded as the high water mark in extended motor touring pale into insignificance beside that now being made by C. L. Welch, sales agent of the Inter-State Automobile Co., Muncie, Ind., who left the factory on March 17 in an Inter-State car on a 25,000 miles trip, which includes a circumnavigation of the United States. The long jaunt which was inaugurated primarily to demonstrate the staying qualities of the car, is being made with a standard touring model of 40 horsepower carrying full equipment. From the strenuous experiences which the party met with on the first leg of their journey, it is likely that the objects of the trip will be accomplished to the full, and also that the original itinerary will be exceeded considerably.

According to the original schedule laid out, the westward leg of the run includes the states of Indiana, Michigan, Illinois, Wisconsin, Minnesota, South Dakota, Nebraska, Colorado, Utah, Nevada, Oregon and Washington, and thence to foreign territory—Vancouver, B. C. Here the nose of the car will be pointed south, and the party will drop down the coast by easy stages until the Mexican border is reached, when another change in the course will be made, and the Southern states will be traversed on the return to the Atlantic Coast. The party will work up the coast to New York and then set out on the last lap, striking directly across New York and Ohio for home. After a month on the road, and battling with mud to the hubs and snowdrifts which necessitated taking to the fields to make progress, the party now is wending its way through Dakota.

### Angry Women May "Flock Alone."

Five ambitious lady motorists, who achieved newspaper publicity last summer by their participation in an exclusively feminine reliability contest from New York to Philadelphia, promoted by a masculine press agent, and who now again sought to enter the spotlight, by taking part in the Motor Contest Association's two days' reliability contest to Atlantic City and return, on May 15, have had their entries unceremoniously returned. By the rules of the American Automobile Association women are specifically barred from competition. So indignant were the fair motorists at being deprived of an opportunity to compete that it is said they now threaten to hold a contest of their very own in which mere man shall have no part, save possibly that of publishing the details of the affair.

## ELIMINATING THE STARTING CRANK

Widely Varying Efforts to Attain that End and the Results Obtained—Importance of the Subject.

There is a certain amount of satisfaction in observing that with improvements in engine design and construction the voices of those who used to clamor against the labors of cranking for the most part have been silenced. This results mainly from the fact that now it seldom becomes necessary to wield the starting gear except when about to operate the machine after a voluntary stop. In consequence whatever de-

suitable arrangements for starting purposes. Like many other features which have been recognized as worth developing, the self-starting device has been overlooked in the race for rapid production which the prodigious increase in the use of cars of all sorts has induced. Another reason to which the seeming lack of progress in this direction may be ascribed is the lack of activity on the part of independent inventors to whom the automobile manufacturer might turn in the event of their producing economical and satisfactory systems. Indeed, from the point of view of the motorist who is really anxious for the popular advent of the really satisfactory automatic starting system, the mechanical aspect of the situation is the most discouraging part of it.

LAYOUT OF ELABORATE MOTOR STARTING SYSTEM

mands have come from the individual motorist for automatic motor starting appliances in the past seldom are repeated at the present time. Largely owing to the lack of insistent demand for apparatus of this class it follows that the average manufacturer is not over-exerting himself to develop something he is not absolutely required to produce.

There are notable exceptions to the rule, however, and such automobile makers as have gone to the trouble to equip their products with automatic starting devices, or even with devices which enable the motor to be started manually without taking the driver out of his seat, find themselves well repaid for the trouble of making the necessary addition to the mechanism. But with a few exceptions the expectations of a year or two ago with regard to the probable increase in the use of such devices have failed of fulfilment.

Various reasons may be ascribed for this, notably the obvious one that the demand has not been insistent enough to impel the makers to go out of their way to develop

Considered as a problem, there is nothing extremely baffling about the elements of the self-starting device. It is necessary first of all to provide means of rotating the crank shaft through anywhere from 90 to, say, 720 degrees, seldom more than that. And it also is necessary to provide means for throwing the starting device into and out of action. Other than this, it is necessary only to provide an automatic releasing device which will free the starting gear from the crank shaft as soon as the motor takes up its normal cycle, and also to provide against the destruction of the mechanism in the event of the ever-imminent back kick.

As sources of power for starting purposes there are a number of possible mediums which may be applied. There is first of all the power of the operator himself, which, by none-too-complicated mechanical means, may be applied either through foot or hand directly from the seat. There is the power of the spring, which may be applied in a variety of ways, the energy used in starting the motor being returned

by the latter after it is in motion, under the control of self-governing mechanism, or the spring may be wound by hand at more or less frequent intervals.

There are various ways in which compressed air may be applied, such as by using two cylinders of a four- or six-cylinder motor as single-acting, two-cycle compressed air motors, or, as is a more favorite method, by merely introducing compressed air into the cylinders on the explosion stroke without otherwise altering the working or arrangement of the machine.

Another method of starting and one which has had a number of advocates in the past, is that of introducing into the cylinder which is about to fire a combustible charge which is forced in under pressure. In some cases the initial charge is carburetted by artificial means, such as by introducing into the air a jet of acetylene vapor, while in others a miniature carburettor is employed to energize the charge as it is pumped into the working cylinder.

Certain other methods of starting have been applied in a few special cases in ways which are not applicable to the ordinary machine, but which are noteworthy in relation to the particular systems to which they are applied. One such is the natural outcome of the gasoline-electric construction in which a certain amount of storage battery is carried on the car for purposes of load-equalization, and which therefore provides a ready means of starting the gas engine by converting the electric motor into a dynamo temporarily. Another special method has been proposed in connection with a system of transmission by means of compressed air motors, wherein the air compressor ordinarily used to energize the working fluid for use in the propelling units is convertible into a motor for starting the gas engine upon the movement of suitable control apparatus.

As already observed, the problem itself does not present enormous difficulties to the skilful designer. The great danger is that in his zeal to render the starting mechanism complete and absolutely reliable in its action, he will increase the mechanical complication of the machine to such an extent as to render it almost prohibitive. Indeed a rather striking example of the degree of complexity which a starting system may reach is shown by the accompanying illustration which reveals diagrammatically an arrangement which recently has been developed by the Mercedes interests. The system comprises, virtually as a substitute for the ordinary hand crank, these interesting and in general original elements: A hand actuated pump, a special carburettor jet, a rotary distributing valve, a special magneto with its distributor, a set of special spark plugs and some two or three control devices.

When about to start the motor, the operator actuates the hand pump, shown at G,

thus raising pressure in the fuel tank C from which gasoline is raised to the carburettor B in the usual manner. By manipulating the valves H, it then is possible to divert the outlet from the pump into the tube K while its suction is taken through the pipe J, which leads from K—a special form of midget intended to deliver a perfect mixture to the pump. The pipe K leads to a rotary distributor valve, shown at L, which automatically selects the cylinder which is next in order of firing and opens a port through which the mixture is delivered to that cylinder. At the same time, a timer-distributor, O, which is a part of the special distributing device, directs the current from the starting magnet to one of the individual starting plugs, P, by which the charge is fired. Naturally, as soon as one or two cylinders have been fired by the artificial means thus elaborately provided, the engine is ready to take up its normal functions in the regular way.

The idea of using a hand pump and special carburettor has been employed by more than one Continental manufacturer, and at least one such system has been seen in this country on imported cars. In general, however, the necessary complication is such as to render it almost prohibitive.

In broad contrast is the system which has been applied by one American maker this year whereby the motor may be started from the seat by means of a special pedal which is connected through toggle motion to the transmission shaft. The mechanism is not complicated, and while it in no way relieves the labor of cranking, it does relieve the motorist of the necessity of dismounting from his seat in order to start the motor, and therefore is of equal advantage with the arrangement which used to be employed on one or two of the now obsolete runabouts of early and tender memory. For small and medium sized motors which are destined to be handled chiefly by their owners, it would appear that some arrangement of this sort would be a welcome improvement and one entailing little trouble to the manufacturer.

Next to the spring starting devices, which have been on the accessory market for a number of years, the most familiar and successful starting system in use in this country for large motors is that in which by the addition of a compressed air tank and a single distributing valve the motor may be set in motion at any time. The tank is charged by by-passing a small quantity of the charges from two cylinders. The distributor merely selects a cylinder the piston of which is descending and directs enough compressed air into it to turn the crank shaft. If the next cylinder in order of firing does not take its charge properly, the air is directed into it and so on until a charge has been fired. The distributor does its work as long as the starting button is held down, and its only effect is to

add compressed air to the cylinder contents so that the normal action of the motor is in no wise upset by the starting device.

With the two exceptions noted, practically no American machines as now produced carry starting devices, though on several cars which are now obsolete more or less simple apparatus was installed for this purpose. The fact that practically all multiple

#### "By This Sign Ye Shall Know Them"

To assist in the sheep and goats division between dealers which the Association of Licensed Automobile Manufacturers is trying to induce in the public mind, the Association is preparing a window sign which is to be sent to every dealer in the United States who handles cars licensed under the

Selden patent. As shown in the accompanying illustration, the sign will bear a picture of the Selden license plate together with wording indicating the fact that licensed cars are sold by the dealer. It will be a foot and a half high and 14 inches across, the lithographed colors being blue, white and gold on celluloid, the idea being that it may be hung either in the window or on the wall. The distribution will take place about May 10.

cylinder engines which are equipped with good carburettors will start "on spark" somewhere about eight or nine times out of ten unless they have been standing idle for a long time, renders the starting device less necessary than otherwise would be the case. That it is, when reasonably considered, a most desirable luxury, however, one incident alone will serve to illustrate.

At a recent motor boat show, one of a group of men which surrounded a new invention for the remote control of marine steering gear was heard to inquire with the bland innocence of the non-technical

whether that system could not be used to start an automobile engine from the seat. It was explained to him that it could not. Then he said:

"My daughter is very anxious to drive her own car. But I am afraid to let her take it out alone because, while she is perfectly competent to drive, I do not want her to crank the motor. She is not strong enough. More than that, I am always worried for fear the thing will kick back. It doesn't matter so much in the case of my own car, though I am free to say that I consider the cranking business one of the greatest drawbacks to the pleasure and convenience of motoring. And I have heard many others say the same thing. What I cannot understand," he added, "is why the makers do not set about it and develop some simple device that will do the work, especially as a feature which would make any car suitable for women to handle."

#### Detroit a Mechanics' Land of Promise.

Reflecting local conditions for which the automobile industry is in no small part responsible, the Detroit Board of Commerce, of Detroit, Mich., is arousing some resentment among employers in the New England manufacturing towns by large advertisements in the New England newspapers urging mechanics to move to Detroit. After reciting Detroit's attractions as to pay, rentals, schools, climate, sanitary conditions, food prices, street car service and amusements, the appeal concludes as follows:

"You owe it to yourself and family to get the most out of your labors in wholesome, enjoyable living, with increasing material prosperity. Come to beautiful Detroit. Write as to the work you desire and such other information as you may want. You are not dealing with an employment agency but directly with the manufacturers of Detroit. Let us know when you are coming and we will have a place for you as soon as you arrive."

#### Carries Oil Through the Air Inlet.

An odd complication has been added to a recent model by a well known foreign maker in the shape of an extra air inlet to the carburettor which is actuated by means of a supplementary foot pedal which the operator is taught to depress when the car is running free at high speed. A peculiarity of the arrangement is that the air thus introduced is taken from the crank case, instead of directly from the atmosphere, and that it is fed into the center of the intake pipe at the top. The result is that the air supply is slightly warmed and also is impregnated with a small amount of lubricating oil in the form of a fine spray, which is carried into the cylinder just at a time when it may be supposed that an extra amount of lubricant is required by the motor, over what is ordinarily supplied.

**STREET SWEEPING WITHOUT DUST**

**Austrian Invents a Motor Vehicle Employing Vacuum Principle and That Holds Promise—In Use in Vienna.**

So far mechanical street sweepers have not proven a great success in New York and other American cities where they have been tried, but several European municipalities have found them efficient enough to order a number to be used as part of the regular street cleaning department. Vienna, Austria, is using a huge affair, shown in the accompanying illustration, which has proven highly satisfactory.

VIENNA AUTOMOBILE VACUUM STREET CLEANING MACHINE

The apparatus consists of a revolving brush, which loosens up the dirt accumulated and pressed down on the asphalt, a suction fan creating a partial vacuum in an inner receptacle, and a roomy compartment in which the loose dirt and dust sucked from the pavement by the fan is deposited. The machine is especially designed for use on smoothly paved streets, such as asphaltum and Belgian block pavements, and dispenses with the water sprinkler which ordinarily is a factor of importance in street cleaning in the big cities.

Health authorities disagree as to the advisability of sprinkling streets in summer. While the water thrown upon the pavement undoubtedly tends to "lay the dust" and to create by its evaporation a coolness in the atmosphere directly above the street, it also acts as incubating material for the numerous species of germs which cannot exist in dry, dusty refuse, but which immediately are revived and multiply in humid, muddy refuse. Unless, therefore, as it is done in Berlin and a few other German and Dutch cities, the "mud" created by the

sprinkling is immediately "washed" away by a plentiful supply of water which carries the whole refuse into the sewers, sprinkling the streets is not an unmixed blessing. In this connection, the vacuum cleaner which does not require a sprinkling of the street to prevent immense clouds of dust being raised by the sweeping machines is hailed with satisfaction by all those who have watched its excellent work in the Austrian capital.

On common pavement the vacuum cleaner is not a great success, particularly in New York and other American cities. America cannot be compared in this respect with Europe, for the refuse thrown into New York streets is of an entirely different kind from that seen in French, German and Eng-

lish cities. The bulky, heavy skins of bananas, watermelons and cantaloupes, the cobs of Indian corn and similar "refuse" present enormous difficulties to a removal by suction machinery. In order to suck up such heavy material the power of the vacuum fan must be very great, so great in fact as to pull out from the crevices between the paving stones the sand or other material used as packing, thereby destroying the pavement. For use on asphalt or Belgian block pavement, however, the vacuum cleaner bids fair to come into general favor.

The inscription in German on the apparatus shown in the picture reads: "Hygienic Sweeping Machine with Dust Suction—Szymanski, Vienna."

**Saving Batteries in Double Ignition**

On cars equipped with double ignition systems it is advisable to economize the batteries as far as possible, doing most of the running on the magneto. This not only saves the expense of frequent renewals but also ensures an ample supply of current for emergency use.

**WASTE WATER TRAPS FOR GARAGES**

**New York's Fire Commissioner to Test Devices for Separating Oil and Gasolene from the Sewage.**

Indicating that New York garagemen are likely to be called upon to equip their establishments with devices for removing all gasolene and oils from waste water, Fire Commissioner Waldo has announced his intention of holding a series of tests bearing upon the subject and intended to demonstrate the effectiveness of such devices as may be available for the purpose. The movement is an outgrowth of a series of sewer explosions extending over a period of several years, responsibility for which generously has been laid at the door of the garage people, despite the fact that in sections of the city affected large numbers of old gas mains are known to exist which frequently are broken in the course of street excavations. Despite numerous conferences during the tenure of former commissioners no official action was taken other than to forbid the use of gasolene about garages for cleaning purposes or in any way which might result in the impregnation of sewage with oils which might give off inflammable gases.

Official notice of the proposed demonstration was issued early this week from the offices of the Municipal Explosives Commission, 157 East Sixty-seventh street, as follows:

Previous to recommending the adoption by the City of New York of one or more designs of separators of gasolene and oils from garage effluent, all inventors and manufacturers of such apparatus are notified that, upon application to said commission, a time and place will be fixed at which a demonstration of the practical value of the respective designs may be made as well as such other tests as the commission may direct.

Communications should be addressed to the commission at its headquarters on or before May 10. The notice is signed by Commissioner Waldo, chairman ex-officio, and the four commissioners constituting the board.

**Why All Cylinders Should Be Working.**

When one cylinder of an engine develops a tendency to misfire, it is a great mistake to attempt to run for any distance without remedying the difficulty, especially as the trouble usually can be located without much delay. When all the cylinders are not working properly the uneven torque of the motor tends to strain the mechanism unnecessarily and if carried to extremes may develop serious trouble of one sort or another, resulting sometimes in complete ruin of the motor.

**E**VERYONE will admit that the Packard is a beautifully silent-running car. The same judgment rightfully applies to the Pierce Arrows and Peerless cars; also to the Renault, one of the finest of the French machines. These cars are also accepted as representing the best in points of design, materials and workmanship, and their success is due justly to the highly scientific combination of all these essential qualities. Of all the world's best machines perhaps none have been better known than these for their Silence in operation.

A year or two ago, however, the Silent-Knight, an engine said to have been designed especially to eliminate noise in operation, was heralded as a step in advance of anything yet produced in point of silence in operation, but not many of these have found customers in this country, due perhaps to their relatively higher cost.

Now comes the new light Silent Six Matheson, Model 18, \$3,500 car guaranteed to be even more silent in operation than the Silent-Knight, and far more so than any other four-cylinder or six-cylinder car on the market, European or American, regardless of price.

But this is not all. This light Silent Six Matheson is guaranteed to stay silent. Take any other car that was reasonably silent when new—how long before it began to grow rattly, loose, noisy? There are so many reasons for that condition

developing. There are equally as many reasons for the light Silent Six Matheson staying silent—these are some:—

- (1) Every one of the 1,500 parts making up the construction of every light Silent Six Matheson is inspected and calibrated **THREE TIMES** by **THREE DIFFERENT** sets of inspectors to insure perfect workmanship.
- (2) Every part must gauge absolutely correct to the 1-1,000 of an inch.
- (3) Every bearing throughout the entire car is uniformly **LARGER** than the corresponding bearing of any other car of like type.
- (4) Every bearing is positively lubricated throughout the entire car, even to the spring shackle bolts
- (5) The element of heat (which is the most destructive element of all in a gasoline motor) is so successfully eliminated as to avoid undue friction, thus practically insuring the lifetime service and efficiency of the light Silent Six Matheson motor, with reasonable care. This is due largely to the location of the valves in the cylinder heads and to the highly reliable lubricating system employed.
- (6) The scientific determination of the very highest grades of materials employed in the construction of the respective parts, for which are used the very finest of specially prepared metals, made for us under formulas which insure the very best physical tests. The materials entering into the construction of Matheson cars are not bought haphazard—all are subjected to the severest laboratory tests, in order to make sure of their certain adaptability to the respective functions which they must perform, under **OUR GUARANTEE, WHICH IS THE STRONGEST AND MOST SWEEPING** ever issued by any automobile maker to our knowledge.
- (7) The scientific **TESTING** of each and every part, the power brake tests of the motor on the block and the final tests of the completed chassis carrying a load of 1,000 pounds over the severe mountain roads about the city of Wilkesbarre, Pa., where the Matheson factory (one of the largest and finest equipped automobile plants in this country) is located.

# son SIX \$3500

Top Extra, \$150

Licensed Under  
Selden Patent

OF SATISFIED OWNERS

we guarantee the light Silent Six Matheson Model 18 to be also superior to all of its type, European or American, less of price, in the following important respects:—

Its weight is the least in proportion to actual horsepower, consequently it is the best car on tires.

It has the greatest ACTUAL horsepower in proportion to its cost.

It has the largest bearing surface in proportion to cylinder dimensions.

It has the easiest riding qualities.

It can throttle down uniformly to the low-speed while running in high gear without jing.

It has the best designed and the safest running gear (irreversible) and steering connection.

It has the strongest transmission and rear construction.

It has a straight line drive (direct on high) through a particularly silent, friction- and extra strong double universal (a universal within a universal).

It has an absolutely infallible selective type transmission, with a never failing interlocking device, which makes it impossible for a set of gears to be thrown out of mesh, through vibration or otherwise.

It has the finest and costliest type of multiple-disc clutch—51 discs of saw steel, 12 inches diameter, hardened and ground, running in a bath of oil.

It has the handsomest lines of design; the interior is luxuriously upholstered, and the whole is superbly finished and equipped.

In submitting the following comparative table we have chosen the Packard, Pierce Arrow, Peerless and Renault, four popular cars (justly famous for everything that stands for the best in motor car construction) because they are probably better known examples of high quality, silent running cars than any others on the market, and if the Silent Six Matheson at its \$3,500 price can bear favorable comparison with cars of such well known high standard, and on test proves more silent, higher horsepower, lighter weight per horsepower, easier riding, more economical in fuel and oil consumption and in tire wear, and to possess throughout more thoroughly approved standard features of mechanical construction, proportionately larger bearing surface and proportionately greater factors of safety, it will likely compare equally well with all others, regardless of price.

To the Public:

I have endeavored to write this advertisement just as I would tell you the story in person in our salesrooms. Its whole purpose is to interest you to the extent of calling upon us to verify every statement by actual demonstration in our light "Silent Six" car itself. Although our claims are undoubtedly the strongest that have ever appeared in an automobile advertisement, you cannot fully realize how really modest they are until you have ridden in this car under all touring conditions.

*C. W. Matheson.*  
President.

## THE STRIVING FOR SPRING WHEELS

### Unceasing Endeavor to Replace the Pneumatic Tire—Difficulties Involved and Why Success is Far Off.

Many inventors have labored long and faithfully over the problem of replacing the pneumatic tire with the resilient wheel of more or less mechanical construction. Considered purely in the competitive way, however, the spring and lever combinations, which usually are adopted, suffer by comparison with the simple tire by reason of greater complication and also a lack of the uniformity of support which the use of the gaseous medium, which the tire envelope imprisons, so readily affords. These two objections have proved insurmountable to inventive genius thus far, though the problem presents so many alluring features that it is likely to continue to be the object of study for some time to come. Strictly speaking, of course, a wheel shod with a pneumatic tire, itself becomes a resilient wheel, to that extent the problem has been solved successfully. It is the mechanical substitute for the rubber envelope and its air contents which has been sought so persistently.

"When speaking of resilient wheels in the ordinary way, however, it is assumed that a wheel with some supplementary resilient device is inferred," as the *Automobile Journal* after a thorough investigation of the subject concludes. "Springs, for instance, may be introduced in order to supersede the pneumatic or enhance its advantages, the underlying idea in most cases being to render possible the use of solid tires on touring vehicles.

"The general prevalence of the steel-studded pneumatic having greatly reduced the liability to puncture, and the advent of detachable wheels and rims having greatly minimized the inconvenience of tire troubles, there has of late been a noticeable absence of the demand which at one time was certainly to be heard among a certain section of private owners for the solid rubber tire. It is necessary for the purpose of considering the resilient wheel problem, however, to suppose that there still does exist a sufficient field for the application of the solid tire, and by taking commercial vehicles into account, it will be very readily admitted that the assumption is justifiable.

"We have pointed out that the pneumatic tire provides the best resilient wheel known at the present time, and in order to understand the problem that besets those who try to invent a substitute, it is very naturally necessary to understand wherein the success of the pneumatic tire lies. Attention must be drawn therefore to two peculiarities to the pneumatic tire, one being the continuity of the air all round the peri-

phery of the wheel and the other being the thin and flexible nature of the envelope or cover that encloses the air, and together therewith forms the pneumatic tire as it is known to motorists.

"When a pneumatic-tired wheel is loaded with a certain weight, the tread slightly flattens and the area of contact—not the internal pressure—increases until the pressure multiplied by the area of the tire in contact with the road is equal to the weight of the load. Only a very small portion of the tire cover has been bent out of its normal shape in the process, and owing to the slight thickness of the walls of the tire only a very small mass of rubber has been moved or subjected to molecular stress. Moreover, as the tire rolls over the ground the continuity of the air-chamber permits the air within to displace itself in accordance with the altered shape of the chamber and so no work is expended on recompensation as would be the case, for instance, were the tire to consist of a series of pneumatic cushions instead of one continuous tube.

"As the result of this brief investigation of the pneumatic, two outstanding factors are shown to be desirable in any resilient wheel that is intended as a substitute. The first factor is small mass in the moving parts and the second is some equivalent of the continuity of the air-chamber. Taking the item of small mass first, it is very clear that the mass will be least when the resilient medium is nearest to the tread of the tire, which accounts for the fact that in most spring wheels the springs, which take the place of the air, are situated immediately behind the felloe. The further away the resilient members are from the tread of the tire the greater is the bulk of material that has to be moved each time that the resiliency of the wheel is brought into play, and the less effective will be the wheel.

"The next point is the equivalent of the continuity of the air-chamber. In many, if not the majority of spring wheels, such an equivalent does not exist, for it is not easy to design a mechanism within the limits of space and weight determined by a wheel that possesses this particular property. It is absent in most spring wheels in which the springs are set radially in the form of spokes; each spring in turn is compressed and released, and a certain amount of work is lost even when rolling over a dead smooth road.

"The important consideration in this case, however, is not so much the loss of power as the possible effect that this incessant action may have on the life of the springs, which are very well known to be liable to fatigue or premature loss of elasticity. It is possible to overcome this objection by using a compensating mechanism such as will make all the springs share equally and at all times in the support of the load, and devices of this kind have been invented. Spring

wheels of this class possess the equivalent of the continuous air chamber in a pneumatic.

"Having now drawn attention to the two fundamental factors associated with the design of a spring wheel, it is necessary, before proceeding to another point of considerable importance, to emphasize an advantage that any resilient wheel possesses when compared with an ordinary carriage spring. In a resilient wheel, the resilient medium or members, as the case may be, are equally effective along any radius, and consequently they can perform their purpose of absorbing a shock equally well in any direction, whereas the limited movement of an ordinary spring placed between the axle and the frame essentially implies that it is efficient only when the obstacle causing the shock operates vertically upwards.

"This is unquestionably one of the great merits of the pneumatic tire, and it is of great advantage that fortunately it has no opposite aspect as is the case with spring wheels and other devices in which the resilient medium is so placed that a mass of considerable inertia is formed by the outer periphery of the wheel.

"In order to understand this adverse side to the universal action of a spring wheel, it is convenient to consider a specific case. Suppose a spring wheel meets a fairly large obstacle under such circumstances as will throw the rim eccentric to the hub almost to the full limits permitted by the spring. If we then follow the progress of the wheel after it leaves the obstacle, it will be found that the next action is the recoil of the spring which jerks the rim out again past its concentric position. This overshooting of the mark always tends to occur in any system that has been disturbed from its equilibrium and is released to find its own neutral position.

"It does not, of course, necessarily follow that this recoil need have a detrimental effect in itself, but if it happens that the next shock coincides with the recoil in such a way that the shock and the recoil are simultaneously in action in the same direction, the result is quite likely to be harmful. It is not difficult to foresee that if this happens a very serious strain is thrown upon the wheel, because not only is the inertia of the rim neutralized before it meets the shock, but the greater part of the resisting force of the springs is already overcome. It is not essential that this condition of affairs should occur, but, as we have said, it may occur, and as a matter of fact it was due to its frequent occurrence in connection with a particularly clever spring wheel that our attention was first drawn to the matter, which up to that time had apparently been totally overlooked, or at any rate considered of no importance by the many inventors then engaged on the subject of spring wheel design."

## WHAT TESTING OF PARTS ENTAILS

**Remarkable Care Required to Make Them a Sure Fit—Processes and Instruments that Are Employed.**

While the average motorist has a somewhat hazy idea as to what testing of parts in a modern automobile means, he rarely appreciates the great accuracy demanded of up-to-date machinery, and the immense labor connected with the testing end of a factory. Not only are a number of trained

GAUGING PITCH DIAMETER

inspectors employed whose sole duty it is to see that the various parts stamped, pressed and drilled are absolutely correct as to measurements, but for each and every

matter of squaring a portion of the propeller shaft for the sliding gears, it is absolutely necessary that this squared part is centered exactly to the main shaft. Large bevel gears have to be tested by micrometer gauge, while smaller gears are examined by

CENTERING SHOULDER ON SHAFT

means of a peculiar-looking instrument shown in one of the pictures.

As is but natural in a car which is intended to run as noiselessly as possible, the distance between gear centers must be absolutely identical in each case, so that replacements may be made when necessary. Furthermore no eccentricity or other irregularity can be permitted to pass. An indicator fitted with a long pointer is used

The crank shaft bearings, for example, are hand burnished to a mirror-like finish and no one bearing differs from another more than a thousandth of an inch. Pistons and cylinders are finished with such accuracy that if they vary one-thousandth of an inch they cannot pass the exacting inspection carried on in up-to-date factories.

By an instrument of special design it is possible to determine if any point of the fly wheel rim is heavier than another and how much. This means substantially perfect balancing. Every fly wheel assembled with shaft and motor parts is thus balanced.

SPECIAL MICROMETER GAUGING

The difficult work of testing parts as to accuracy is never turned over to new or inexperienced men. Usually the most careful and steadiest men are chosen for this

RAMBLER PARTS INSPECTION—TESTING SPUR AND BEVEL GEARS FOR ECCENTRICITY AND TRUTH

part there are two and even more gauges, testing machines and sometimes specially constructed instruments for detecting slight inaccuracies in weight and eccentricity.

In the accompanying photographs are shown some phases of the process of testing individual automobile parts as carried on in the factory of Thomas B. Jeffery & Co., Kenosha, Wis., where Rambler cars are made. For instance, in the important

work and a good inspector is a valuable asset in any automobile factory.

Piston rings are ground both on the face and on the sides. The pistons themselves, cams and cam shaft bearings, all ball cones and cups, roller bearing sleeves and roller bearing cases and gears are ground in the same way. In some cases this grinding process is not considered accurate enough.

work and a good inspector is a valuable asset in any automobile factory.

An important feature of their work, which seldom is appreciated by the layman, is that the regular inspection of parts along standard lines furnishes a close check upon the accuracy of all factory processes and establishes a regular means of detecting any laxity on the part of operatives or faults in processes.

**REDUCING COMMERCIALS' UPKEEP**

**Truck Manufacturer Outlines Some Simple Rules—Points Out Precautions That Will Save Tires.**

Operators of commercial motor cars, in order to realize the maximum of service from the vehicles constituting their equipment should make a careful study of all text books and helpful paragraphs designed for the guidance of the novice in the realms of the pleasure car, culling therefrom the simplest and most obvious directions in regard to vehicle maintenance and posting them up somewhere on the garage wall for the delectation of the employees. For the average motor truck driver requires exactly the same sort of patient tuition as does the average possessor of his first small car.

In this connection the Gramm Motor Car Co. has compiled and issued a set of four axioms which are worth remembering, though to the average motorist of experience, as trite and obvious as all true axioms should be. They are:

"Make daily inspections.

"Keep all working parts clean.

"See that bolts and nuts are kept tight.

"Keep all working parts well lubricated."

The same authority, in the course of a series of brief directions relating to the general upkeep of the machine which are intended more for the driver and caretaker than the owner himself, says:

"In going down a grade, should you shut the motor off, don't let the clutch in when going at a good clip or in slow speed. It is apt to tear the motor to pieces and twist the transmission shaft. Take it carefully and let clutch in easy so that motor is started as it should be.

"A half-and-half solution of denatured alcohol and water is excellent for cleaning lamps. It is absurd to pay for powerful lamps and then sacrifice a quarter of their light through failure to keep the burners, lens, mirrors and front doors in condition.

"Pipes and passages of acetylene generators should be periodically blown through to see if they are clear, and if there is a cotton filter for the gas this should be changed occasionally if it seems to require it. Especially should it be seen that the different parts of the generator go together freely and that they can be fastened in accordance with the maker's instructions.

"Dry springs are responsible for squeaky sounds, which are not only disagreeable, but make the car sound old and ride hard. It is because the individual leaves become in time rusted and do not slide freely over each other. This condition may be easily remedied by jacking up the car so that the chassis will hang from the springs and in-

roducing flake graphite. One very good way to introduce the graphite is to mix it with thin oil, or even with kerosene, and then 'float' the graphite in between the leaves."

In regard to that all important matter, the care of tires, the Gramm man continues:

"Do not round curves at too great speed. It is playing with fate to attempt to round corners on two tires, besides it is bad for the tires.

"Never expose your tires to too great a degree of warmth or cold for any length of time. It is a wise plan to stop on the shady side of the street on hot summer days.

"Keep away from the curb. How often we see cars jammed against the curb, with the tires pushed out of alignment and the wheel itself strained in an unnatural position.

"You cannot expect long tire life if you constantly overload your machine. Tires are almost human. They will not stand up under a heavier load than they were made to carry.

"Start your car in a straight line, if possible. Do not twist around on the steering wheel before you get under way; this imposes a heavy and unnecessary strain on your tires.

"See that the wheels always run true. The unequal planes of some wheels will cause unusual strains which wear the tire out much more rapidly than is necessary.

"Never allow oil or grease to come into contact with your tires. See that the garage floor is clean and wipe up all the oil that might find its way to the tires. It is a wise precaution to see that oil-soaked waste rags, etc., are kept away from the inner tubes in the tonneau tool box.

"See that the brakes of your car work correctly, evenly and easily. Never jam on the brakes too suddenly. Instant locking of the brakes not only destroys the tires, but is likely to injure the car itself. A car can really be stopped within a shorter distance by putting on the brakes gradually, yet firmly."

**Attention That the Spare Wheel Requires.**

One difficulty which has developed to some extent in connection with the use of detachable or spare wheels which are coming into use abroad and, in a lesser degree, in this country, is the tendency of the hubs to rust, thereby rendering the process of replacement far from a simple or easy matter. Needless to say, the difficulty may be prevented by occasionally removing each of the wheels and thoroughly cleaning and lubricating the hub. The necessity of the precaution, however, is not likely to impress itself upon the motorist who comes into possession of such an equipment for the first time, so that the hint is one well worth remembering.

**ONE ELECTRIC VS. FIVE HORSES**

**Another Interesting Comparison is Produced—Shows a Saving of \$1,002 by the Electric Service.**

When a merchant or manufacturer decides after some deliberation to replace his horses by motor trucks, the question which is the most important factor in his decision is naturally that of first cost and the cost of upkeep. Exhaustive tables for both gasoline and electric vehicles have been published from time to time, succeeding statements of the sort proving the growing success of the manufacturers and also the reduction in operating expenses which is a natural outcome of increasing familiarity with the details of a relatively new system. One of the most recent statements of this kind just has been issued by the Waverley Co., Indianapolis, Ind., makers of electric automobiles and delivery wagons.

The case assumed is that of a man who uses two one-ton delivery wagons, keeping them in constant operation; his investment would be at a very low estimate:

2 one-ton wagons at \$380.....	\$760.00
5 Horses at \$220.....	1,100.00
2 Sets of harness at \$45.....	90.00

Total investment ..... \$1,950.00

His expenses during the year are:

Oats .....	\$480.00
Hay .....	227.00
Bedding .....	45.00
Water and tools.....	30.00
Stabling .....	30.00
Shoeing .....	90.00
Interest at 6%.....	117.00
Depreciation at 20%.....	390.00
Drivers' wages .....	1,248.00

Total expenses for the year.... \$2,657.00

Owing to the greater speed of the automobile the work of this man's two wagons easily could be performed by one electric truck of the same capacity. His investment for an electric delivery wagon of one ton capacity would be \$2,000.00.

His expenses for one year are:

Cost of current (375 charges)....	\$219.44
Allowance for battery renewals, repairs .....	289.00
Average for tires and other repairs .....	225.44
Interest at 6%.....	120.00
Depreciation (10% on \$2,000, less cost of battery and tires).....	126.35
Driver's wages .....	524.00

Total expense for the year.... \$1,604.23

The balance of totals then would be:

Total outlay for horse-drawn service .....	\$4,607.00
Total outlay for electric service..	3,604.23

Making a net saving per year of \$1,002.77

These figures are based on the average expenses for a series of years, and are taken from the actual experiences of owners of Waverley electric delivery vehicles in constant service.

### To Warm the Mixing Chamber.

Cars which, either through economy in construction or their antiquity, are not equipped with means for warming the mixing chamber of the carburettor frequently may be improved in action if provision is made to that end. Oddly enough, properly heating the gas on its way to the cylinders also has the effect of reducing the tendency to the accumulation of soot inside the combustion chamber, which is characteristic of many ancient motors, since it assists materially in vaporizing the fuel. In order to heat the carburettor, the jacket surrounding the mixing chamber may be filled with hot water from the cylinder jackets, or with a small quantity of waste gas, by-passed from the exhaust manifold. Another method is that of introducing directly into the mixture a small quantity of pure air taken through a heater surrounding the exhaust outlet. All three methods, of course, are employed in modern types of power plant, and either one of them can be fitted to an existing machine without much difficulty. The latter method, however, as being applicable to a carburettor which is not provided with a jacketed mixing chamber, generally is easiest to apply and, in general, the most satisfactory all around.

### Where the Nameplates Come From.

Disclosing the source of the name plates which embellish various parts of a number of the most famous cars, a sample book or catalog has been issued by the Chandler Co. of Springfield, Mass., which manufactures name plates and stampings. By the use of bronze and silver inks the representations of the name plates give the appearance of real brass or nickel, as they appear when on a car. The styles shown include lettering in knurled panels, ordinary finish with black enamel or oxidized background, black lettering in relief with gold finish background, enameling in two colors with "old brass" polish, and cut out plates—some of which are cut out by means of dies and others sawed. Silver and black plates also are shown, with samples of clockdials and meter scales. The catalog indicates that the company makes light stampings of any metal up to  $\frac{1}{8}$  inch thick, finished or unfinished, plated or not, and that it also manufactures a great variety of punch press work, shims, special washers, scales for measuring and the like.

### Making Demountable Rims More Secure.

Despite the apparent security of the demountable rim in its most familiar forms, failures have been known to occur in cases where the locking ring turned over in its groove or where the clincher side ring broke as a result of being improperly supported. To obviate troubles of this nature an improvement has been introduced in the

Firestone demountable construction whereby the ring is afforded a double seat and an added interlocking feature which are calculated to render it absolutely positive in its engagement at all times and under all circumstances.

The nature of the improvement is illustrated in the accompanying illustration, which shows the conventional section. Besides the regular lip which is formed on the inner side of the ring for the purpose of affording a seat for the clincher side ring, a second lip is formed on the outer side. This engages an up-turned edge of the rim proper and thus prevents the ring from rolling in its seat. Two dowels are inserted in the ring on either side of the break, which engages corresponding holes in the ring side when the latter is forced over into place by the inflation of the tube.

The result is that the ring is so held against springing that it cannot escape from the groove and also is prevented from creeping. The two improvements are being embodied in the regular product of the Firestone Tire & Rubber Co., of Akron, O., as it is now being marked.

### Why Japan for Rim Recoating.

Motorists who have been cautioned to use only japan in recoating the wheel rims after the metal has become exposed as a result of abuse or chipping of the original covering, sometimes are moved to wonder why plain black paint and varnish of the sort used by the makers of the car would not be a better material for the purpose. The reason is not far to seek when the relative skill of the average motorist and the average automobile painter are compared. With the requisite craft and the time necessary to allow the pigment to harden thoroughly, paint undoubtedly is superior to japan. The point is that the average rim painting job comes at the end of a more or less protracted overhauling, when there is not much time to spare either for the work itself or for the paint to dry after the work is done. Therefore, the quicker drying and more readily applied material is by far the more suitable for the purpose under ordinary, everyday circumstances.

### For Fireproofing of Small Garages.

Owing to the extreme fire-hazard of the garage, particularly in the case of establishments of the smaller order, a considerable demand has arisen for construction materials suitable for roofing and wall coverings. A recent addition to the products which are designed specifically for this purpose just has been introduced by the H. W. Jones-Manville Co., New York City, under the trade names "J-M Asbestos Roofing" and "J-M Asbestoside." In producing the roofing and siding materials numerous sheets of asbestos felt, similar in nature to that which the manufacturers in question employ so extensively in the production of gasket and packing materials, are thoroughly saturated with Trinidad lake asphalt and cemented firmly together. The resulting material, because of its all-mineral nature, not only affords adequate protection against fire in addition to the usual elements, but it is not subject to disintegration under the effects of the weather and requires no paint or other preservative to keep it in good order. The new products are comprehensively treated in a descriptive booklet which is being distributed among those who are interested in the subject.

### Big Book Dealing with Equipment.

Bearing on its bright orange cover the words, "Everything for the motor and motorist," the 1910 catalog of the Motor Car Equipment Co., 55 Warren street, New York City, apparently fulfills its cover promise to the utmost in its 144 pages of illustrations, descriptions and prices relating to automobile supplies and accessories. The offerings go through the whole range of well known brands and include a number of importations for which the company is the sole United States agent, including Oleo spark plugs, Pirelli ignition cable, Blanchard horns, A. V. magneto spark plugs, English compounds pumps, Pogon plugs and similar specialties. Articles of the company's own manufacture also are well represented in things like Grab pump connections, Continental lamps, Kracker Jack tool kits, etc.

### Advantages of One Key for All Locks.

To prevent garage employes and idle chauffeurs from tampering with the motor, the use of some form of lock applied to the bonnet is a very good thing. Where such a device is used, however, it is wise to have the lock of a similar type to those which are used for the tool and battery boxes as well as any other locked compartments about the machine. When this is done, it is possible to provide a single key which will give access to any part of the car, thus reducing the liability of becoming stranded on the road without means of getting at some part which requires attention, save by the expedient of breaking in.

**WORM DRIVING CONSIDERATIONS**

**Reasons for Sluggishness at the Start—Lubricating the Contact Surfaces—Continuous Action Induces Silence.**

Although the use of worm gearing as applied to mechanical purposes of varied sorts has become very general in this country, it is an odd fact that the worm-driven rear axle for automobile use has made more rapid progress in England than here. In one instance, that of the Lanchester cars, worm drive has been in use for a number of years and with entirely satisfactory results, while a number of other makers have adopted the system more recently. Discussing

and coasting. A car fitted with a worm-driven axle would seem in general to have conveyed the impression of slight sluggishness under these conditions, more particularly in respect to being not so lively in getting away from a standing start.

"Proper lubrication is the secret of success with the worm-drive. The worm, with its wedge-like sliding action, seems to have an especial propensity for squeezing the oil out from between the surfaces in contact, and it seems to be the opinion of engineers that the only way of ensuring satisfactory lubrication is to confine within low limits the intensity of pressure between the working surfaces in contact by making those surfaces as large as possible.

"It is not difficult to appreciate why the worm-driven axle should not show to its

**WHERE MAYO RADIATORS ARE MADE**

**One of the New Factories Typical of the Industry—Huge Stocks of Material That Are Carried.**

Progress is always interesting. In some cases, the reasons back of it lend a double interest. In these days, new automobile factories are common enough, and in their train they bring a correspondingly increasing number of parts, material and accessory factories, for it is little short of astonishing to know the number, kind and extent of industries that are created, related or brought into touch with the automobile business. No less astonishing is the suc-

VIEW OF MAYO RADIATOR CO.'S FACTORY AT NEW HAVEN, CONN.

some practical phases of the worm-drive principle, a well-known authority brings to light one or two noteworthy points in connection with the operation of cars employing this type of transmission.

"Most manufacturers who have adopted the worm-drive," he observed, "have done so because of its inherent quality of silence. The worm-drive is by nature a more silent mechanism than the toothed bevel, because its method of transmitting power is absolutely continuous, and of a sliding wedge-like kind. The bevel depends for its continuity of action on the accuracy of its manufacture, since by nature its operation consists of a sequence of blows. To an extent the worm and the bevel may be compared, respectively, to the propeller and paddle-wheel in steamship propulsion.

"From the purchaser's point of view, the relative efficiencies of the worm-drive and the bevel are largely associated with the practical differences that are likely to be noticeable on the road. It is a common opinion expressed among those who have experience with both types of car, that the only noticeable difference between a worm-driven axle and a bevel-driven axle is to be observed under conditions of starting

best advantage when starting a car. At the moment the clutch is engaged the worm and its wheel are brought into contact with great force; then, if ever, will the lubricant be squeezed out from between them and the full frictional resistance of the metals be encountered. As the car accelerates, the intensity of the pressure rapidly diminishes, lubrication is restored, and the efficiency of the transmission improved so much that it is not uncommon for anyone sensitive to subtle changes in the behavior of his car to experience a rather extraordinary feeling of sudden accession of power to his vehicle at the moment when it gets into its stride."

**Hardening Steel Automobile Parts.**

Treating and hardening work for automobile parts has been taken up as a specialty by the Bridgeport Metal Treating Co., of Bridgeport, Conn., which recently acquired the hardening business of the A. G. Barrow Co., of the same city. A new department has been added for the treating of high speed steel, and this, together with the other work in the plant, is under the personal supervision of William T. Gibson, who has had large experience.

cess which many of these concerns have achieved in developing specialized products, motors, transmissions, axles, ignition appliances and carburetters. But among them, perhaps, no line save that of ignition has been more generally confided to the exclusive attention of the parts specialist than that of radiators. Progress in these lines has resulted in the creation of not a few factories devoted to specialized production in lines which were entirely unknown only a few years ago.

Prominent among the new plants of the sort is that of the Mayo Radiator Co., at New Haven, Conn., devoted to the exclusive production of Mayo radiators, and which is here illustrated. Located along the Northampton branch of the New York, New Haven and Hartford Railroad, in the outskirts of the old New England town, to which it is a distinct acquisition, there are features about it and in connection with it that are distinctly interesting not only in respect to the product itself both as to its quality and variety, but also in regard to the detail methods which are employed in turning it out.

The new factory itself, which only recently was completed, may be called a mon-

ument to a policy, for it was made possible by the strict adherence to a policy of doing but one kind of work, and that the best, and getting for it a price commensurate with its worth.

From the moment one enters the office

every piece is rigidly inspected, the inspection service particularly being painstaking and thorough.

The business has grown from a modest beginning and it is only fair to say that it is largely due to the thorough knowledge

ticularly during the gear shifting process, frequently may be improved if a small amount of flake graphite is introduced with the regular lubricant and allowed to work into the wearing surfaces of the discs. By filling in the pores of the metal and rendering the surfaces absolutely smooth they free themselves much more readily than before, especially if, through any sort of abuse, they have become at all roughened. In many cases the dragging effect results merely from the use of an improper grade of oil or from continuing to use the clutch after the oil has become too thick. The result is that after an extended period of engagement the discs are held together with considerable force, causing the driving shaft to spin after the pedal has been depressed, introducing difficulties in gear changing and burring the teeth of the pinions. Such adhesion, of course, is distinctly bad and should be done away with at whatever cost.

#### For Strengthening Headlight Brackets.

Headlight brackets which are not provided with the tie-rod with which a number of machines now are equipped and which serves to prevent the lamps from vibrating excessively, may be stiffened partially by the simple expedient of binding a stout leather strap tightly across from one fork to the other. It is important that

GENERAL INTERIOR VIEW OF MAYO RADIATOR CO.'S PLANT

makes a tour of inspection and departs, the impression is one of orderly cleanliness, coupled with plenty of light, skilled workmen and modern machinery operating under the most advantageous conditions.

The main building is a long, single structure, 355 by 100 feet, with two additional buildings, 150 by 30 and 60 by 80 feet, containing more than 50,000 square feet of floor space. A 50 horsepower gas engine supplies the power and the output is over \$3,000 worth of radiators per day.

In regard to the product itself, it goes without saying that it is of great variety and reveals here and there an outline or a familiar detail which discloses the hitherto unsuspected origin of the cooling system of some well-known car. Indeed, a tour of the floors, showing as it does the products destined for use by automobile manufacturers in all parts of the country, makes it plain that the prestige of the Nutmeg State in respect to the development of special wares of light manufacture in no wise is waning. To give some idea of the amount of stock carried, the accompanying cut of the stock room shows over 600,000 pounds of brass, and 55,000 pounds of solder on hand and ready for use. A glance at the illustration showing the interior of the assembling floor gives a further idea of the amount of product which is being handled in the daily routine of business.

In the construction of the Mayo radiator, every modern manufacturing process is employed, among them dipped brazing, and

STOCK ROOM SHOWING LARGE QUANTITIES OF RAW MATERIAL

and good business management and judgment of its founder, Mr. V. St. J. Mayo.

#### Graphite Good for Disc Clutches.

Multiple disc clutches which evince a tendency to drag when disengaged, par-

the lamps be held as rigidly as possible, and where the method suggested does not accomplish the desired result, it is a good plan to take the brackets to a blacksmith and have a tie rod welded across from one to the other.

**T**HE Fifty-four Toy Tonneau is a mid-season New Rambler model. It is an evolution from the Close Coupled model, designed for the same demand, but a little more roomy.

Its advantages are low seats, two inches longer than usual from front to back. Seat cushions tilted and rakish seat-back to correspond. Body smaller and lighter than the touring car but tonneau roomy enough for three people of average size. Three inches more leg room in front than touring car. Rakish steering column.

With five lamps, Prest-o-Lite tank or generator, magneto and storage battery, horn and tools, \$2,250. Top with side curtains, \$100. Wind Shield \$40. Spare Wheel \$85.

## PACKING MOTOR CARS FOR EXPORT

Why They Require Protection and How They Should Be Protected—Mexican Instance as "Horrible Example."

Lack of appreciation of the true conditions which obtain in the handling of merchandise in transit to foreign lands has cost the American exporter a great deal, both in prestige and in actual profit on foreign commerce. Instances in which shippers not only neglect to see that their goods are packed in such a way as to withstand the abuse of the carriers and handlers, but also fail to afford them adequate protection against climatic influences, are only too familiar to forwarding agents and consular representatives. But one of the most flagrant instances of the sort which has come to public notice is that recorded by American Consul William W. Canada, of Vera Cruz, Mexico.

"On March 18," writes the consul, "a steamer arriving from New York brought a large, fine automobile for a concern in Mexico City, shipped by a Massachusetts house. The machine was simply enclosed by an open slat crate, with pieces of thin cotton sheeting on the inside to cover the contents. The crate was well made, but neither it nor the inside flimsy covering afforded any protection from the elements to this fine machine, for on the two days succeeding the unloading from the vessel there were heavy rains, but, thanks to the vigilance of the terminal company's employees who covered the crate with a heavy tarpaulin, no moisture reached the crate or its contents, and the customs authorities gave instructions to load the machine on a flat car for the road."

But though the machine was saved almost accidentally from dangers which might have been prevented by a careful shipper, its troubles did not end with its loading on the railroad car. Apparently the shipping company was more interested in advertising its own name and address to the various people handling the crate than to give its ultimate destination. The address of the consignee had been hurriedly written in blue pencil on the outside of the crate, whence it disappeared at the first rubbing of the elbow or hand, while the name of the shipping firm was stenciled in heavy black letters that could be seen far off. The initials of the consignee were absolutely undecipherable, and as the surname was a common one, the destination of the automobile became a mystery.

Little information could be obtained from the bill of lading, as that document contained no mention of an automobile, but specified merely a "box" weighing so-and-so much. The customs officials, in despair, unloaded the automobile from the freight

car, weighed the empty car, then loaded the automobile on again, weighed the loaded car, and thus discovered the weight of the crate, which had to tally with that given in the bill of lading as being the weight of the "box" shipped by the firm in question.

American railroad agents probably would have taken for granted that the crate shipped by one firm, and weighing several thousand pounds, was identical with the "box" named in the shipping document of the same firm, but in Mexico people have a little more time to give to such matters, and there were so many inaccuracies connected with the shipping of this crate that the authorities had become suspicious and afraid that the steamer had delivered some other machine than that specified in and called for by the shipping papers.

Emphasizing the necessity for the most careful packing of bulky goods to be sent to the interior of Mexico, Consul Canada says: "The freight transit from here to Mexico City consumes time on the railroad, which leads over high mountain ranges, where torrential rains are of almost daily occurrence at this season of the year, and the chances for getting the automobile to its final destination without being thoroughly wet are slight.

"The question of packing and marking goods may seem a trivial matter at the other end, for no thought is apparently given to the endless tangle that it leads to here, besides the delay and trouble caused and the chances of having the car damaged by the rains. Automobiles ought not to be shipped in crates, but always in strong cases with either tarred felt roof and sides, impervious to water, or in cases metal lined and soldered, so that no moisture can penetrate through tops or sides. There is imperative need for this when it is considered that all such heavy and bulky freight must go forward on open flat cars, for the box cars on these roads are not furnished with side or end doors sufficiently large to admit an automobile, as in the United States."

### One Car to Replace 21 Horses.

Oregon is to have a new automobile stage line from Boring to Rhododendron Inn, a distance of thirty miles. At present seven stages and twenty-one horses carry the passengers and mail between these two points, but a new Franklin 45 horsepower touring car which has been secured is intended to displace all these stages. Two trips daily are scheduled, so that the total distance the car travels per day is fully 120 miles. The last ten miles are up mountain roads, which rise 2,500 feet, are thickly covered with sand, and are among the worst in the United States. In many other localities in the Western States the old-time horse-drawn stages are fast disappearing, while modern high powered automobiles takes their places.

## MOTOR CAR IN ALASKAN SERVICE

Great Work it Performs as a Stage in Gold District—Tires, too, Supply Something Like an Inflation Record.

To run 8,000 miles with heavy loads over rough roads within the Arctic circle, without a puncture or pumping up of tires, is a record of which any car can be proud. While it must be admitted that the resisting power of rubber increases considerably with the fall of temperature, this feat is extraordinary enough to excite remark. The news of it was brought from Alaska by H. H. Ross, who visited Syracuse last week.

The car was a 42 horsepower Franklin, seven passenger touring model, used by Ross, who is a gold prospector, for the purpose of establishing a stage service from Fairbanks to Fox Gulch, a distance of a little over eleven miles, five of which consist of a long, rough climb. As many as six trips a day have been made, while on some occasions the car carried as many as seventeen people at a time. Besides the regular passengers it transports bags of gold dust, weighing up to a hundred pounds each. On one occasion the car carried \$35,000 worth of the gold. On the Fourth of July last year the automobile transported no less than seventy-one passengers in five trips. It is said that the lucky owner of this car has found a "gold mine" in it which pays him a better revenue than many a real one. It is in use eleven months of the twelve.

### Fire That Disproved Popular Theories.

Tires remaining intact after being subjected to intense heat and even gasoline tanks which have failed to burst under equal provocation, are familiar sights in the remains of garages which have been damaged by fire. But about the most remarkable instance of the sort which yet has come to notice is reported in connection with the \$35,000 conflagration which the H. E. Frederickson Automobile Co., Omaha, Neb., suffered recently, and which at first was reported to have entirely destroyed its garage. Nearly all of the cars which were in the garage at the time of the fire had gasoline in the tanks, some of the tanks being nearly full—two of them, indeed, were entirely full. It is not a little surprising, therefore, to learn from local authorities that not one of the tanks exploded. Even more remarkable still is the fact that, although no less than 45 Prest-O-Lite gas tanks were in the garage, not one of them was found to have suffered, popular impression as to the impulsive nature of acetylene gas under any and all circumstances to the contrary notwithstanding.

## Club Elections

Kinsley (Kans.) automobile owners have organized the Kinsley Automobile Club. Col. F. D. West has been made president and J. M. Watson secretary.

M. M. Maxwell has been elected secretary of the Cleveland Automobile Club to succeed C. J. Forbes, jr. The latter recently resigned the office to accept a position on the selling staff of the Studebaker Automobile Co.

A new organization has just been formed in Joliet, Ill., and adopted the name The Will County Good Roads and Automobile Association. Its officers are: President, S. Lager; secretary E. W. Steinhart; treasurer, Robert T. Kelly.

Motorists belonging to the Montgomery (Ala.) Automobile Association elected the following new officers: President, J. H. Cook; vice-presidents, John Flowers and B. Wolfe; secretary, Percy F. Black; treasurer, A. M. Kennedy. The old board of governors was re-elected.

At a recent meeting of automobile owners of Helena, Ark., it was decided to form the Helena Automobile Club. The following officers were elected: President, C. L. Moore, jr.; vice-president, W. A. Coolidge; secretary, J. B. Dunlap; treasurer, R. E. Chew, jr.

At the second annual meeting of the Litchfield County (Conn.) Automobile Club nine towns were represented. The election of officers resulted as follows: President, John N. Brown; vice-president, Earl Baxter; secretary, N. D. Holbrook; treasurer, George E. Cole.

Chauffeurs of New Orleans have formed The White Chauffeurs' Protective Association with 95 charter members. The following were elected the first officers of the association: President, A. Marulla; vice-president, Harry Munson; secretary, J. F. Ryan; treasurer, Pierre Crabites.

The Yale Automobile Club, which is made up of students at the university of that name, has reorganized with the following officers: President, J. H. Hammond, jr.; first vice-president, L. T. Bates; second vice-president, H. H. Logan; secretary, L. S. Allen; treasurer, C. D. Winslow.

At a recent meeting of the Knoxville (Tenn.) Automobile Club the election of officers resulted as follows: President, N. E. Logan; vice-president, J. W. Brownlee; secretary, James Wrinkle; treasurer, A. C. Harmon. The board of governors comprises, besides the officers, David Chapman, J. J. Price and E. G. Oates.

At the annual meeting of the Blue Grass Motor Club the following officers were elected: President, K. G. Pulliam; vice-president, E. H. Alexander; secretary,

James S. Helm; treasurer, W. S. Viley. The following board of governors was chosen at the same meeting: The officers and E. L. March, Alex. Morgan, C. E. Lyons and Dr. H. H. Roberts.

Members of the Winfield (Kansas) Auto Club at their recent meeting voted to call their association the Winfield Automobile Club instead of the shorter name. The following officers were elected at the same meeting: President, George Colthurst; vice-president, R. W. James; secretary and treasurer, J. W. Hanlen. The board of directors includes, besides these officers, J. E. Jarvis, F. R. Schwartz and L. R. Mogle.

### How Motor Cars Help Physicians.

That the automobile is an asset of considerable value to a physician, aside from its actual monetary worth, is the opinion of doctors who own motor cars. One such, in speaking of the services his automobile has rendered him, said: "During the first year, after I bought my runabout, my practice increased over seven hundred dollars. During the following year over fifteen hundred dollars, and during the third year it was nearly three thousand dollars greater than when I bought the car. I believe the cause to be partly my increased ability of attending to calls coming from more distant quarters, my quicker return from calls, and to some extent, perhaps, the advertising value of the automobile. It is useless to deny that the public seem to have more confidence in a doctor who is able to buy a motor car than one who calls on foot after a ride in trolley or subway. That's why it is a good investment for a physician to buy an automobile. Within a year or two his increased practice pays for the car and its support, and a reputation once gained is not easily lost afterwards."

### Here's the "Shock Absorbing" Coat.

Not satisfied with the resiliency offered by good upholstery, a comfort loving German motorist has invented a new kind of overcoat. This wonder of the textile industry has a rubber pillow "built" into its back. When the roads become a little too bumpy, the happy owner of one of these new-fangled coats blows a little air into the pillow, leans back against the cushions of the car, and all the bumps, even the hardest, are taken up by the pneumatic "shock absorber" behind his shoulders.

### "Universal Signal Code" Up Again.

What the famous "C. Q. D." signal in wireless telegraphy is to the fleet of ocean steamers, a blue light is to become to the motorist, namely, an urgent appeal for help from passing automobiles, according to the project of C. W. Christman, of Waterville, Minn. In common with a number of other reforms he has suggested a code to be adopted by all drivers of motor cars the world over, made up of horn and light signals, which at present are used locally by

Minnesota drivers. The horn signals are as follows: One short toot, "Stop;" two short, "Going Ahead;" three short, "Going Back;" one long and two short, "C. Q. D." call; two short and one long, "Let me pass." Additional danger signal at night, a blue light, produced by covering with a blue glass one of the front lamps, if the machine stands in the roadway, or if the machine should be ditched, by setting such a blue light in the roadway.

### Fruit Growers Issue an Appeal.

English farmers seem to have reached the conclusion that a conciliatory tone towards the automobile owner and driver is likely to be more effective than browbeating, and the establishing of police traps. As the British touring season opens, fruit growers' associations, whose members have suffered greatly in the past owing to the prevalence of motor cars on the highways adjoining their farms, publish broadcast the following appeal: "We, the fruit growers of Hampshire, earnestly ask motorists to exercise consideration for fruit growers in the Hampshire fruit districts during the summer season, when passing the grounds, in regard to speed, as in dry weather the dust raised by high speed is liable to settle on the fruit, picked and unpicked, thereby doing damage to it and decreasing its market value. We feel sure that motorists have only to know this to be considerate in this respect."

### Novel Advertising Car Tours South.

Although advertising automobiles have been used extensively in the larger cities, comparatively few have been sent on long trips through the rural districts. An innovation in this line is the big yellow automobile built by the Studebaker Automobile Co., South Bend, Ind., for the Quaker Oats Company. This car is of 40 horsepower, surmounted by a sort of cupola of glass under which a small cannon stands, which discharges "puffed rice" in a golden shower, to reproduce in miniature the process of puffing rice and wheat, which is one of the patented cereals of the Quaker Oats Company. The tonneau is divided into compartments to carry samples for distribution during its tour of the South. The car left Richmond, Va., and now has reached Jacksonville, Fla., where it is attracting considerable attention.

### May Bar Tourists from Okerthal.

The German Imperial Automobile Club is urging all foreign motor tourists to pay special attention to the traffic regulations in force in the Okerthal district in the Harz mountains. The authorities of the government of Brunswick have threatened to close the entire Okerthal to automobile traffic unless the regulations are heeded. This would mean that one of the most beautiful valleys of Germany would be barred to motoring tourists.

## RECENT PATENTS.

952,055. Automobile Headlight. William H. Tonne, Trenton, N. J. Filed May 17, 1909. Serial No. 496,475.

1. In a device of the class described the combination with an axle and a guiding member, of a bracket carried by said guiding member and comprising a primary and an auxiliary section, said primary section provided with an upwardly extending angularly disposed portion, a pivoted bar member, a supporting bolt secured to the outer end of said bracket and supporting said pivoted bar member for swinging the same when said guiding member is actuated.

952,144. Mud Guard Attachment. Joseph A. Sauer, Hamilton, Ohio. Filed May 28, 1909. Serial No. 498,804.

1. An attachment of the character described, comprising curved parallel bars pivoted to the under side of a mud guard at one of their ends, the free ends of said bars having longitudinal slots formed therein, a transverse shaft adjustably mounted in said slots, means for securing the shaft in its adjusted position, a brush

rotatably mounted on said shaft, the periphery of said brush being concave for engagement with the periphery of a vehicle wheel, a rod secured to the under side of said guard and movable through the brace bar, a spring disposed between the brace bar and the mud guard upon said rod adapted to tensionally hold the brush in contact with a vehicle wheel, and means carried by the rod to regulate the tension of said spring.

952,166. Automatic Timer. Gilbert Wright, Schenectady, N. Y., assignor to General Electric Co., a corporation of New York. Filed Dec. 24, 1908. Serial No. 469,085.

1. A timer for internal combustion engines, comprising a tubular hub, a plurality of contacts carried thereby and insulated therefrom, insulated conductors led through said hub and connected respectively with said contacts, a casing rotatable concentric with said hub, and a movable contact carried by said casing.

952,175. Pneumatic Tire. Robert T. Badgley, New York, N. Y. Filed March 13, 1909. Serial No. 483,308.

1. A pneumatic tire having its tread surface provided with projections, depressions within the area bounded by said projections, and air chambers beneath said projections, as set forth.

952,188. Armored Tire for Vehicles. Comfort D. Farr, Detroit, Mich. Filed Dec. 2, 1908. Serial No. 465,590.

1. An armor for vehicle tires, having in combination an annular retaining plate adapted to be clamped along its inner edge between the side of a wheel tire and the adjacent portion of the rim, a plurality of individual retaining plates adapted to be similarly clamped on the opposite side of the tire and rim, bolt members whereby the individual plates may be correlated to form an annular retaining member, all of said plates having their outer edges bent over to constitute a retaining groove, and warped guard plates adapted to engage transversely over the tread portions of the tire, their lateral edge portions being bent over complementarily to the adjacent edge portions of the guard plates, and being adapted to engage therewith and to be held in place over the tire thereby, substantially as described.

*'Tis not in mortals to command success, but we'll do more—deserve it.*

**Mayo Radiators have achieved success by deserving it, and in no other way.**

¶ Therefore that success is presumably of the permanent and abiding kind.

¶ Price is the cause of the absence of MAYO RADIATORS from cheap cars.

¶ Quality is the reason for the presence of MAYO RADIATORS on most of the good cars.

¶ The only argument against MAYO RADIATORS is their price.

¶ Every other consideration dictates their use.

¶ MAYO RADIATORS combine sound mechanical principles, exact design, construction and workmanship, together with graceful appearance and perfect finish; in short, all the good qualities that go to make the ideal radiator.

¶ MAYO RADIATORS are stamped with the hallmark of class.

¶ MAYO RADIATORS are really the thoroughbreds of the radiator world.

¶ MAYO RADIATORS are made in the kind of a factory that befits them and by the MAYO RADIATOR COMPANY, at New Haven, Connecticut.

**Kelly-Springfield Auto Tires**

Made by the Makers of the famous Kelly-Springfield solid tire

952,268. Electric Battery Holder. Carl T. Mason, Sumter, S. C. Filed March 12, 1909. Serial No. 482,977.

1. An electric battery holder comprising an insulating head formed with vertical openings, a plurality of connectors secured to the under side of said head having means to contact with the exterior electrodes of the cells, conducting tongues projecting from said connectors and upwardly through the openings in said head and terminals extending through the head and having their lower ends engaged with interior electrodes of the cells and their upper ends engaged with said tongues.

952,326. Carburetter. Franklin W. Hagar, Nashville, Tenn. Filed Oct. 1, 1908. Serial No. 455,712.

1. In a carburetter of the type set forth, in combination, a shell having a mixing chamber therein, a liquid supply nozzle located centrally and axially of said mixing chamber, said mixing chamber having an inlet for air and an outlet for gas, a strangler part movable freely and axially of the mixing chamber, a companion relatively stationary part concentric to the strangler part and defining therewith a throat-way through which air passes prior to its mixture with the liquid fuel discharged from said nozzle, one of said parts having an inclined face forming a wall of said throatway, said strangler part being moved by the influence of the suction in the mixing chamber, to proportionately increase the effective size of said throatway and exteriorly manipulate manually operated means for adjustably moving said strangler part in the direction of its movement by suction influence and for supporting said strangler part in the positions into which it is adjustably moved.

952,353 Wind Shield. Henry B. Pitner, Dubois, Pa. Filed Aug. 31, 1909. Serial No. 515,457.

1. The combination of a wind shield having upper and lower sections, the lower section having its upper edge beveled downwardly and rearwardly, and the bottom edge of the upper section being correspondingly beveled, parallel link connections uniting the two sections at their ends whereby the upper section may swing downwardly and rearwardly against the rear face of the lower section, co-acting devices adjacent the ends of the two sections to engage each other when said sections are superposed, a keeper at the center of the upper edge of the lower section, and a catch at the center of the bottom edge of the upper section to engage said keeper and retain the sections in superposed position.

952,413. Universal Joint. Preston H. Breed, Pittsfield, Mass., assignor to Alden Sampson Manufacturing Co., Pittsfield, Mass. Filed Nov. 13, 1909. Serial No. 527,922.

1. In a box type of universal joint, the combination of a box having an inner straight bearing surface, a shaft extending into the box and having a laterally projected portion, of a two part bearing block between the projection of the shaft and the inner surface of the box, the outer member of the two part block having a straight bearing surface in engagement with the bearing surface of the box and the adjacent surfaces of the two parts of the block constructed to interlock with each other.

952,435. Socket Wrench. Charles Miller, Syracuse, N. Y., assignor to C. M. B.

Wrench Co., Syracuse, N. Y., a corporation of New York. Filed March 20, 1909. Serial No. 484,613.

1. A wrench of the class specified comprising a holder having a detachable nut socketmember, and an operating handle pivotally and detachably connected to said holder, said nut socket member and handle being interchangeable in their attachments as set forth.

952,436. Ratchet Wrench. Charles Miller, Syracuse, N. Y., assignor to C. M. B. Wrench Co., Syracuse, N. Y., a corporation of New York. Filed March 20, 1909. Serial No. 484,612.

1. A wrench of the class described comprising a head, a ratchet wheel journaled therein, a pawl carried in the head for actuating said ratchet wheel, a hollow ball formed on the head, a hollow handle provided with the socket having a loose pivotal connection with the ball, and means extending through the socket and into the ball for retaining said parts in frictional engagement as and for the purpose set forth.

## TIRE MAKERS TO ASSIST DEALERS

Seven of Them Form an Association for the Purpose—Evils Which They Expect to Eliminate.

To assist the legitimate automobile dealer in handling tires at a profit and generally to make his way pleasanter, the Dealers' Protective Association has been formed, and already it has established offices at 25 West 42d street, New York City.

Despite its name, however, the association is not composed of dealers but of tire manufacturers, the members being as follows: Diamond Rubber Co., Continental Caoutchouc Co., Hartford Rubber Works Co., Morgan & Wright, Fisk Rubber Co., B. F. Goodrich Co. and the G & J Tire Co. L. W. Bennett has been appointed general manager of the organization and will have active direction of its affairs.

While it is admitted that the so-called "automobile leagues" and other price-cutters and cutthroats and abuses generally will receive attention, Mr. Bennett states "in no way, shape or manner will the association undertake to maintain the selling price on tires of the various independent companies concerned. Each company," he adds, "will be free to nominate its own selling prices; no price agreement of any nature is involved."

"To promote and foster the interests of the dealers of the United States engaged in the purchase and sale of automobile tires and accessories and to assist in the marketing of said tires at a profit," is the manner in which the objects aimed at are officially expressed.

Some of those interested in the movement frankly state that the prevailing abuses are such that it is not possible for the dealer to sell tires at a profit, and as a result not many dealers are selling them or trying to sell them. If these abuses are corrected they figure that the market and distribution channels will be enlarged and a more

wholesome state of affairs be effected. In working to this end the new association will also seek to improve the public education as to the proper use of tires and will conduct a campaign designed to cause a better understanding of the evils of overloading, under-inflation and the like.

### Watt Charged with Bankruptcy.

Six creditors have filed a petition in bankruptcy against the Watt Motor Co. of Detroit, Mich., which has been skirmishing for money and which only two weeks since was dropped by the citizens of Lapeer, Mich., after they had advanced some capital to bring about its removal to that place. The petitioning creditors all were identified with the company, their claims being for labor and money loaned; the largest claim is that of George Watt, for \$1,800. The petition alleges that the company has committed acts of bankruptcy in that some of its property has been concealed and some has been transferred to Michael G. Delany, president of the company, and other directors. It also is said certain creditors have been favored.

### Goodyear Canadian Company Completed.

The Goodyear Tire & Rubber Co., of Canada, Ltd., has been incorporated with \$250,000 capital, and these incorporators: D. B. Simpson, W. F. Stearns, Norris Wilson, D. C. Betts, J. S. Moorcraft, A. W. McMillan, and J. H. McMurtry, all of Bowmanville, Ont. The company, which is the offspring of the big Akron establishment, has established its factory in Bowmanville and its offices and salesrooms at 85-87 Queen street, East, in Toronto.

### Harvester Making Holsman Buggies.

The Independent Harvester Co., Plano, Ill., has taken up the manufacture of high wheeled motor buggies of the type made by the defunct Holsman Automobile Co. The Harvester company is operating under the Holsman patents and has engaged H. K. Holsman, the patentee and former manager of the Holsman company, as consulting engineer.

## NEW INDEPENDENTS JOIN HANDS

Michigan Defendants Take the Initiative and a New Organization Results—Anti-Selden Attitude Defined.

Regardless of their other effects, the suits for infringement of the Selden patent instituted three weeks since by the Association of Licensed Automobile Manufacturers against nine Michigan manufacturers, served first to bring eight of them together and later to bring about the organization of another "independent" association, which has been talked of ever since the American Motor Car Manufacturers' Association, in February last, voted to "go out of business." The new organization was formed on Monday last in Detroit, when the name Association of Motor Car Manufacturers was adopted. Officers will be chosen at a meeting which will be held on May 16th.

The getting together of the "interested eight" was due to a call issued by Hubert Dalton, of the Flint Wagon Works and the W. A. Paterson Co. The invitation was extended only to the nine Michigan manufacturers who had been sued, but the ninth one, the Owen Motor Car Co., did not attend the meeting, which was quietly held in Detroit on Friday, April 22d. Those represented were the Anhut Motor Car Co., Carhartt Automobile Corporation, Demotcar Co., Flint Wagon Works, Imperial Automobile Co., Paige-Detroit Motor Car Co., W. A. Paterson Co. and the Warren Motor Car Co.

A temporary organization committee of five was elected, "and charged with the duty of formulating tentative plans for permanent organization, and of calling a general meeting of representatives of active manufacturers of automobiles, not affiliated with the A. L. A. M., for the consideration of these plans."

Acting for this organization committee, Henry C. Walters, who is a Detroit lawyer, called this general meeting, which was held

in Hotel Pontchartrain, Detroit, on Monday last, 2d inst. About 40 manufacturers were in attendance, or were represented by attorneys, but the meeting was enshrouded in such secrecy that nothing is known of its transactions save the fact that it was decided to adopt the title Association of Motor Car Manufacturers.

Mr. Walters's call for Monday's meeting, however, disclosed the attitude and opinions of those who attended the initial gathering. Excepting that part of it which announced the holding of the preliminary meeting, this call was as follows:

"The opinion of those present at Friday's meeting is that the manufacturers outside the Licensed Association must form an immediate alliance for the protection of their business; that this protection can best be assured by a legitimate and dignified campaign of educational advertising, and by the presenting of a solid front in defense of companies compelled to defend their rights to do business in actions now pending or that may be instituted later. Eminent counsel, thoroughly versed in patent law, advise that the entering of a decree sustaining the Selden patent in any court of the United States in an action against even the smallest and most humble manufacturer will warrant the court, on application, in issuing a preliminary injunction against any manufacturer upon whom service of process can be had in that particular circuit.

"It is apparent, therefore, that the companies not yet sued are almost as much interested in the pending litigation as those which have been selected as court targets.

"All the unlicensed companies are equally interested in the publication throughout the country of facts showing the real motives and aims of the Licensed Association. That association is now divided against itself, and the time is opportune for us to take the aggressive and strike a telling defensive blow in support of our investments. We will have the support of the general public in any proper action, and of about one-half the members of the Licensed Association. To the everlasting credit of many members of the A. L. A. M. it must be said that they do not approve of the present tactics of the combination. They recognize the fact that the unfair and coercive methods which are being followed are taken at the instance of manufacturers whose product cannot compete with that of many of the unlicensed producers. The public should be made acquainted with this interesting condition of affairs and informed at once that members of the Association responsible for what is being done are engaged in an attempt to advance their own interests by destroying their competitors, instead of proceeding along legitimate upbuilding lines.

"The gentlemen who met on last Friday will form an association whose aim will be to gain a lawful end in a lawful manner, and your company is invited to become a member of that association. Your repre-

sentative—or better still, representatives—may attend on next Monday, and discuss the situation pro and con, without committing you to the proposed plan in any manner or to any extent. The name of any company sending representatives and not joining the association will not be made public."

#### Maxwell Now Heads Maxwell-Briscoe.

Benjamin Briscoe having resigned the office in order to devote himself wholly to the United States Motor Co., in which the Maxwell-Briscoe company is the chief cog, J. D. Maxwell has been elected to the presidency of the Maxwell-Briscoe Motor Co., as the Motor World last week stated would be the case. Previously Mr. Maxwell was vice-president and general superintendent of the company and busied himself chiefly with its mechanical affairs; now as the head of it he will, of course, take over its general direction. Messrs. Maxwell and Briscoe have been associated since 1903, when the former induced Mr. Briscoe, then of Detroit, to take an interest in the automobile, which he had evolved as the result of experience dating back to 1894, when he (Maxwell) and Elmer Apperson conducted a machine shop in Kokomo, Ind., and were induced by Elwood Haynes to build the first automobile.

#### Brewers and Bakers to Build Trucks.

Detroit's remarkable roll of automobile manufacturing establishments has been lengthened by the addition of the Oliver Motor Car Co., capitalized at \$300,000, which purposes to engage in the production of motor trucks and wagons. The principal shareholders are Louis W. Schimmel, secretary and treasurer of the Tivoli Brewing Co.; Paul Wagner, dealer in brewers' supplies; Henry Wagner, Henry Wagner, Jr., and Christopher Wagner of the Wagner Baking Co.; Charles Brushaber and Robert F. Hartenstein. Several factory sites are under consideration.

#### Parts Makers to Produce Cars.

The Standard Metalwork Co., Thompsonville, Conn., an offshoot of the G. H. Bushnell Press Co., of the same place, and which for several years has been making automobile parts, among other things, is preparing to engage in the manufacture of complete cars. The Bushnell company, which produced heavy oil presses, has sold that portion of its business, and the principals henceforth will devote themselves to the Metalwork company, which is a \$75,000 corporation of which Mark W. Bushnell, James A. Calvin and Lucius F. Robinson were the corporators.

#### Hoffman to Superintend the Homo.

Jacob Hoffman, who for seventeen years was connected with the A. & M. F. Brown Machine Co., of Elizabeth, N. J., has been engaged as superintendent of the Gasolene

Moter Efficiency Co. of Jersey City, and hereafter will have to do with the manufacture of the Homo efficiency device. Hoffman is reputed to be a mechanical genius, and that he was held in high esteem by his former employers is evidenced by the fact that when he resigned they tendered him a farewell dinner and presented him with a smoking set.

#### Sibley Purchases a Detroit Factory.

The Sibley Motor Car Co., which recently was formed in Detroit with C. P. Warner as president and Eugene Sibley as secretary and treasurer, has purchased a former valve plant located at Solvay and Mackie avenues, in Detroit, and will at once prepare it for operation. Meanwhile a temporary office has been established at 870 Woodward avenue. The purchase includes a plot of two acres and the factory building thereon, 60x280 feet. The company's car, a 20 horsepower touring model, which will sell for less than \$1,000, will not be ready for this winter's market, however, although demonstrating models will be on the road.

#### Clarkson Leaves A. L. A. M. for S. A. E.

Coker F. Clarkson has been elected general manager and editor-in-chief of the Society of Automobile Engineers. To assume his new duties Clarkson resigned the assistant general managership of the Association of Licensed Automobile Manufacturers, with which he has been associated for some three years past, first as the active director of its mechanical branch and, until his recent resignation, as assistant general manager, also.

#### Again Enlarging the Stewart Factory.

Due to the demand for Stewart speedometers, the Stewart & Clark Mfg. Co., of Chicago, again has been compelled to enlarge its plant. Work on the addition, which it is expected will be completed and in operation by July 4th, already has commenced. It will be 110x125 feet, two stories and basement.

#### May Establish Two Assembling Plants.

During the course of a visit to Minneapolis, F. H. Goss, secretary of the General Motors Co., who at the time was accompanied by a Chicago architect, was quoted as stating that his company was contemplating the establishment of an assembling plant in that city. Another establishment of the same order, he said, might be located in Kansas City, also.

#### Horner Assumes Rapid's Management.

George A. Horner has been chosen general manager of the Rapid Motor Vehicle Co., Pontiac, Mich., to fill the vacancy caused by the recent death of H. G. Hamilton. Horner has been identified with the company for the past three years and is, therefore, well acquainted with its affairs.

**MARCH EXPORTS PASS MILLION**

**New High Water Mark Reached, Canada Accounting for Half of Record Sum—Big Gain in Italy, Also.**

Exports of automobiles established another record during the month of March, when they passed the million dollar mark. They attained a value of \$1,007,387 as compared with \$615,681 during March, 1909. The total number of cars was 751, as against 361.

Canada during the month took more than all the rest of the world combined, the figures being \$524,209 for British North America, and \$483,178 for all other nations. The increase in the trade with Canada amounted to \$384,729, or 257 per cent. On the other hand, there was a falling off in the shipments to France and the United Kingdom, the former taking less than one-half the amount of March, 1909. Germany was but a small buyer of American motor cars, the amount, \$4,336, being, however, over four times that realized in the corresponding month of 1909, when but one car was exported.

Italy increased its imports, also, from \$60,011 to \$111,073, as did the West Indies and Bermuda, which took \$57,171 worth, as compared with \$27,153 in the preceding March.

Although individual countries during the past month took a smaller amount than in former years, the total exports for the past nine months show that every foreign market into which American cars enter, without a single exception, increased its purchases. British North America leads, with \$2,509,810, as against \$923,475 for the same months of 1909, and it is far ahead of Great Britain, the next largest customer, which shows a total of \$1,344,600, as against \$931,534.

The total for the nine months of the fiscal year was \$6,382,271, as against \$3,279,036 for the nine months of the previous year, while the cars numbered 4,180, as against 1,610. The record in detail follows:

	March—		Nine Months Ending March		
	1909	1910	1908	1909	1910
Automobiles and parts of—					
Automobiles .....	\$548,640	\$806,184	\$3,159,147	\$2,845,750	\$5,372,458

**Dealers Tackle Second-Hand Problem.**

With the object of simplifying the always troublesome used car problem, the Licensed Automobile Dealers' Association of the City of New York has formulated a project for the disposal of all cars taken in trade by its members. At a full meeting of the association, held on Monday of this week, initial steps were taken looking toward the establishment of an outlet of such goods. Although full details of the plan are withheld pending the completion of arrangements, it is understood that a large establishment in the nature of a second-hand mart is to be operated more or less on a co-operative basis, thereby relieving the Licensed dealers themselves of the burden of conducting that branch of the business. It is expected that the plan will be in operation within three months.

**Becker, Sr., Dead at Ripe Age.**

Harmon B. Becker until recently the nominal president of the Elmore Automobile Co., Clyde, Ohio, died on Tuesday last, 3d inst., at his home in that city. He was aged eighty-four years and had not been active in the business for a long time. The Elmore company was made up of Mr. Becker and his two sons, James H. and Burton B., and was the outgrowth of the bicycle manufacturing business in which they previously had engaged. A few months since the Elmore company was taken over by General Motors Co., and is now listed as one of the properties in which that merger is "interested."

**Cleveland's Loss Is Detroit's Gain.**

The American Distributing Co. of Jackson, Mich., has closed its office in Cleveland and opened one at 1514 Ford Building, Detroit, Mich. This office will be the headquarters of D. K. Moore, who managed the Cleveland place.

**Stevens-Duryea Secures More Land.**

The Stevens-Duryea Co. has acquired a large tract of land adjoining its present factory in Chicopee Falls, Mass. It signifies, of course, an enlargement of the plant.

**SCENT "GENTLEMEN'S AGREEMENT"**

**Licensed Association Hears One Exists Between Tire Makers—Special Meeting Called to Discuss Subject.**

The tire situation again has caught the eye of the Association of Licensed Automobile Manufacturers, and as a result there is promise of "something doing" at a special meeting which has been called for Wednesday next, 11th inst. There are those in the association who believe they have scented the existence of a "gentlemen's agreement" between the tire manufacturers and the desire exists to smoke it out, if it be in existence. This is made plain by the call for next Wednesday's meeting, which says:

"One of the important things for consideration at this meeting will be the tire situation, which is extremely critical, and one that demands consideration at this time by the entire membership, as it affects every manufacturer, as well as the present and future owners of motor cars.

"In this connection it is requested that each board member, before attending the meeting, will endeavor to investigate the rumors which are current to the effect that there exists among certain tire manufacturers of this country an understanding or 'gentlemen's agreement,' to increase the price of tires and to refuse to sell or deliver to manufacturers at this time any tires for 1911 equipment.

"It is hoped that you will obtain all the information available relative to the tire situation, so as to be prepared for an open discussion at this meeting, which promises to be one of the most important (from a manufacturer's point of view) that the association has held.

"A number of other important subjects will come up for consideration at the meeting and it is hoped that nothing will prevent your having your board member in attendance."

**Rippen Organizes the Penn-Unit.**

The Penn-Unit Car Co. has been formed in Allentown, Pa., and already has secured a part of the Grape Capsule factory in that city and installed the machinery necessary for the manufacture of automobiles. Paul P. Rippen is the prime mover in the venture. With him are associated Walter Rippen, Samuel P. Byers and James K. Bowen.

**Two New Men on Hudson Staff.**

Richard Bacon, Jr., until recently sales manager of the Haynes Automobile Co., and Percy D. Stubbs, formerly with the White and Overland companies, have been added to the staff of the Hudson Motor Car Co., Detroit. They will be associated with E. C. Morse, manager of sales.

## C. T. JEFFERY ASSUMES CONTROL

Father Leaves Him Half of Rambler Business and He Takes Charge—Mr.

Jeffery's Other Bequests.

Charles T. Jeffery, who for 16 years was a partner with his father—who died suddenly in Italy on April 2d last—in the firm of Thomas B. Jeffery & Co., Kenosha, Wis., has assumed complete control of the manufacture and sale of Rambler automobiles. As, subject to the direction of his father only, he had managed the business for the past several years, the duties will not be strange to him.

Under the terms of his father's will, which was admitted to probate last week in the Kenosha County court, Charles T. Jeffery became possessed of a half interest in the firm, the other half being bequeathed to the widow who is given one-half of the entire estate, which is estimated to be worth between \$3,000,000 and \$4,000,000, together with the splendid Jeffery home on Durkee avenue in Kenosha. The interest of Mr. Jeffery in the firm of Thomas B. Jeffery & Co., with the exception of real estate owned by the company, is, as stated, equally divided between the widow and Charles T. Jeffery, the eldest son.

The real estate owned by the company, as well as nearly all of the other real estate of the deceased, is left in equal shares to the widow and Harold W. Jeffery, the younger son. Property in the William Deering subdivision in Chicago is given in trust to Charles T. and Harold W. Jeffery, with the understanding that one-third of the income from this property is to be paid to Mrs. Elizabeth C. Trant, of Stoke, Devonshire, England; one-third to Frederick J. Jeffery, of the same place, and the remaining third to Charles W. Parker, an old friend of the deceased in Manitoba.

At the death of these three persons the trustees are directed to transfer this real estate to Mrs. Eva Jeffery Carqueville of Chicago and Mrs. Florence J. Hudson of St. Louis, Mo., the surviving daughters of Mr. Jeffery.

The will makes a bequest of \$30,000 to Edwin W. Jeffery of Cleveland, O., a nephew of the deceased.

After the payment of this bequest and the carrying out of the other provisions of the will, all the remaining personal property of the deceased is bequeathed in equal shares to Mrs. Kate E. Jeffery, the widow; Mrs. Carqueville and Mrs. Hudson.

### Orson Gets Factory Room in Springfield.

The Orson Automobile Co., the organization of which was announced in New York with a flourish of trumpets, and which, it was stated, would make a specialty of building cars for the bankers and brokers of

Wall street and embodying their ideas, will locate in Springfield, Mass. A portion of the factory building formerly occupied by the Bailey Automobile Co. has been leased and the necessary machinery is being installed.

### Johnson to Take Up Commercial.

In order to engage extensively in the manufacture of light delivery wagons and heavy trucks, the Johnson Service Co. of Milwaukee, Wis., has increased its capital stock from \$1,000,000 to \$1,500,000. While new headquarters will be secured for this department, the present plant will be retained for the manufacturer of automobile parts. At the stockholders' meeting at which this action was decided on, the financial statement of the company then presented showed assets of \$1,186,626.03, and that the profits of the fiscal year were \$186,626.03. It was the twenty-fifth annual meeting of the company, and in recognition of the fact, and also of his services, Professor Warren S. Johnson, vice-president of the company, was presented with a Tiffany vase of solid silver, twenty inches in height.

### To Produce Motors in Fort Wayne.

The Fort Wayne Auto Motor Co., which will manufacture an engine designed by G. G. Bowersox of Rochester, N. Y., has completed its organization by the election of the following officers: President, A. D. Cressler; first vice-president, Henry P. Scherer; second vice-president, G. G. Bowersox; secretary, D. Burns Douglas; treasurer, George H. Loesch. The former Haberkorn engine building in Fort Wayne, Ind., is being put in shape for the manufacture of the new product.

### Canadian Rivals for Regal Plant.

The Canadian cities which are across the river from Detroit have commenced to bid against each other for the branch factories of the manufacturers on the American side of the stream. The Regal Motor Car Co. is the first of those who have profited by the rivalry. As a result of inducements offered by Windsor, the Canadian Regal plant will be removed from Walkerville to that place. The Windsor factory will be 100x60 feet.

### Chadwick May Move from Pottstown.

It is not improbable that the Chadwick Engineering Co. may remove from Pottstown to Norristown, Pa. The proposal has been made to the Chamber of Commerce of the latter city that if \$100,000 is subscribed for it will be sufficient to bring about the removal.

### Barrett Goes with Studebaker.

O. S. Barrett has been appointed by the Studebaker Automobile Co., of South Bend, Ind., to handle its advertising interests. He will make his headquarters at South Bend.

## ARE LIABLE FOR LOANED CARS

Court Holds Borrowers Responsible for Their Damage—New York Firm Victor in Somewhat Unusual Suit.

That the purchaser of an automobile who, while awaiting his car, may be accorded the courtesy of the use of another car is responsible for the latter was the sense of a decision rendered last week by Justice Gavegan in the New York Supreme Court. The parties to the action in question were Wyckoff, Church & Partridge and J. H. Durnell, the well-known turfman, who, in 1908, placed an order for a car valued at \$4,600, on which he paid a deposit of \$2,000.

While awaiting the receipt of the car, the New York firm gave Durnell the use of a second-hand machine, which one day was taken out of the garage by Durnell's chauffeur without the knowledge of his employer. During the course of his joy ride the chauffeur ran over and killed a man and injured his wife and two children and completely wrecked the car. The chauffeur—Benedict, by name—was arrested and sentenced to imprisonment for one year, Durnell appearing as a witness against him.

Durnell then refused to pay Wyckoff, Church & Partridge the remaining \$2,600 due on the new automobile, claiming that the firm had no right to permit his chauffeur to use the old car without his permission. He coupled this refusal with a demand for his deposit of \$2,000, and when this was refused he sued for the amount. Wyckoff, Church & Partridge, in turn, filed a counter suit for \$5,742, the value of the wrecked car. In his decision, Judge Gavegan held that Durnell not only could not recover his \$2,000 but that he must pay the full amount of the counter claim.

### Knox Declares Two Dividends.

Holders of preferred stock in the Knox Automobile Co. of Springfield, Mass., are to receive two dividends of 4 per cent. each, as a result of the action of the board of directors at a meeting on the 19th inst. The first dividend will be paid on May 15 and the second on July 15.

### To Make Tops in Waterloo.

Waterloo, Ia., has a new enterprise in the Auto Top Co., which has taken temporary quarters in the Corn Belt Garage on Fifth street. The concern, which is a project of Chicagoans, will make tops and later will secure a factory exclusively for itself.

### Simplex Has a New Jersey Plant.

The Simplex Automobile Co., of New York City, is transferring a part of its manufacturing operations to New Brunswick, N. J., where a factory has been built for it. More buildings are to be added later.

## LIGHT ON RUBBER CONDITIONS

London Market Takes Queer Turn—Two Americans Returned from South America Add to Enlightenment.

According to cablegrams from London, the rubber situation took a peculiar turn on Tuesday last, when 180 tons of plantation rubber were offered in various lots by ten different brokers without a single sale being effected. It appears that the rubber buyers have determined to force down the high prices which are prevailing, but their bids were so low that the brokers withdrew the entire lot, which by agreement will be offered again on Monday next. The cablegrams naively remark that the brokers are confident that the American demand for rubber will keep up prices to the recent record-breaking figures.

In the interim the rubber market and, consequently, the tire situation, remains unrelieved, and that it is becoming more tense is indicated by rumors that most of the leading American tire makers may resort to extreme measures of one nature, or another. Meanwhile two keenly interested Americans who recently returned from the Amazon country have given it as their opinion that the demand and the prices prevailing are not artificial and are due solely to the law of demand and supply. Henry C. Pearson, editor of the *India Rubber World*, a recognized authority, and F. A. Sieberling, president of the Goodyear Tire & Rubber Co., are the gentlemen whose opinion has been referred to.

"The rubber manufacturer, from the beginning of the industry," says Mr. Pearson in his publication, "has been in a position of not being able to control in any way the cost of the chief material required in his business; or to contract very long in advance for supplies at a fixed price; or even to cultivate with accuracy the cost of material at any given time ahead. The uncertainty involved has been exceedingly inconvenient to the manufacturers and it is not surprising that at times the changing prices of raw rubber have been attributed to other than the actual causes.

"For some reason or other many manufacturers seem disposed to consider every rise in the cost of rubber to be due to 'speculation'—in other words the idea obtains that rubber is 'cornered' somewhere and held for sale at prices not justified by trade conditions. Of late this impression apparently has been strengthened by reports that rubber is being 'held up' on the Amazon with the aid of the government, under the new law authorizing banks to advance money on rubber stocks, whereas formerly Amazon rubber had to go forward to market whenever it came down the rivers, without regard to prices realized.

"Whatever may be the ultimate effect of the new regulations, it is a mistake to suppose that rubber is being stored on the Amazon today, with the aid of bank advances or otherwise. The price of \$3 a pound is so alluring that every producer in the world is hurrying his rubber to market, in order to realize on it before a decline comes. It may be that rubber will go still higher, but it would be superlatively foolish to pay storage charges and interest on bank advances to hold rubber from the market under present conditions.

"Another point against the idea that rubber is being stored in the countries of production is the fact that the imports of consuming countries were never before so large as at this time. On the whole, it appears safe to assert that rubber prices today are as fully controlled by conditions of supply and demand as at any other time in the history of the trade."

"Are the causes artificial or natural that have produced the present situation, and is the world to be deprived of the great boon of cheap rubber?" asks Mr. Sieberling, in leading up to an amplification of the opinion he expressed on his return from his tour of investigation through South America that took two months' time and more than 2,000 miles of travel in the fever-laden district of the Amazon river. Incidentally, Mr. Sieberling was, so far as known, the first American rubber manufacturer to take this perilous trip.

"The high prices prevailing for crude rubber," he says, "are fairly attributable to two primary causes: First—the abnormal draft upon the world's supply in providing tires for automobiles; second—the wild speculation in rubber and rubber shares in England, which has taken on the aspect of a 'South Sea Bubble' in a mad scramble of people of all classes to 'get rich quick' on rubber. London is the financial center of the world's rubber market, and the craze now running its course there is having a tremendous sentimental influence toward lifting prices. This will correct itself in the collapse which—in due time—is certain to come, and which will carry with it its trail of disaster and ruin to the rubber gamblers in the manner always attending the bursting of financial bubbles.

"Stories are being circulated to the effect that the rubber supply is being rapidly exhausted, and that the world is facing a famine; but a careful review of the situation justifies an opposite opinion.

"The past year more than 70,000 tons of crude rubber, having a value approximating \$300,000,000, were produced, of which 40,000 tons came out of the Amazon district. This was wholly wild rubber, gathered almost entirely from a belt extending along the Amazon and its tributaries and running less than three miles into the interior. The vast forest beyond these borders is substantially untouched; but with the building of the railroad around the falls of the Ma-

deira—which will be completed in 1911—and with the building of roads through the forest connecting up rivers, the introduction of the automobile and the gasoline boat, vast districts heretofore inaccessible will be brought within reach of the rubber gatherer; and, while the gain in production each year has been approximately but 10 per cent. over the previous year, there is no question that this percentage will increase largely from this time forward.

"But a very important factor toward relieving the existing situation is found in the plantation rubber in the East Indies, which is now coming into the market in large quantities, each year's production being substantially double that of the preceding year. Whereas we had less than 4,000 tons in 1909, we shall receive approximately 8,000 tons in 1910 and well up to 16,000 tons in 1911, and within five years a quantity larger than is now furnished by the Amazon, which is a remarkable result considering the fact that three years ago the production of the entire East Indian district represented but a few hundred tons.

"That product of nature which exists in abundance, and which the world needs, it will find a way to obtain. Wild rubber trees in almost limitless quantities exist in Brazil awaiting the touch of human energy to yield up their latex, and the world will undoubtedly find means to obtain its required supply.

"The ruling classes in Brazil are an intelligent people, and though they have been slow to realize the advantage of planting rubber, they are now following the lead of the East Indians, and within a few years the Amazon Valley will be furnishing plantation rubber far in excess of the wild rubber now coming down the river.

"As an indication of the immensity of its opportunities, one island in the mouth of the Amazon River, Isle Marajo, which is larger than the State of Maine, is capable of furnishing plantation rubber in quantity more than the entire world is now consuming. The government is enacting legislation to stimulate the planting of trees, and, while we shall temporarily be subjected to high prices of crude rubber, since it is known that plantation rubber can be produced for 25 cents a pound, as certain as night follows the day we will within a few years have a large over-supply that will bring the cost lower than it has ever been heretofore.

"Users of rubber tires, on account of the present high prices, will have thought toward prolonging their life and increasing their mileage, which can readily be done by carrying proper pressure of air, and particularly with Clincher Tires, which, semi-deflated, will rim-cut and speedily disintegrate. Watching the adjustment of brakes will largely extend the life of the treads. Tread cuts that reach the fabric should be quickly repaired to prevent moisture reaching the cotton thread."

**THE WEEK'S INCORPORATIONS.**

Newark, N. J.—Taxicab Service Co., under New Jersey laws with \$50,000 capital.

Milwaukee, Wis.—A. G. Spalding & Bros., under New York laws with \$50,000 capital.

Milwaukee, Wis.—Morrison Motor Car Co., under Illinois laws with \$15,000 capital.

Philadelphia, Pa.—The Bartlett Garages, Inc., under Pennsylvania laws with \$65,000 capital.

Louisville, Ky.—Weber Auto Truck Mfg. Co., changes name to Frank Weber Motor Vehicle Mfg. Co.

Birmingham, Ala.—International Automobile Railway Switch Co., under Alabama laws with \$10,000 capital.

Wilmington, Del.—Delaware Automobile Co., under Delaware laws with \$10,000 capital; general automobile business.

Owosso, Mich.—Owosso Motor Co., under Michigan laws with \$200,000 capital; to manufacture motor delivery wagons.

New York, N. Y.—Hartford Suspension Co., under New York laws with \$100,000 capital; to manufacture automobile accessories.

Lakota, N. Dakota—Beek Auto Co., under North Dakota laws with \$40,000 capital. Corporators—R. H. Beek, G. F. Lamb, J. H. Kirwain.

Hartford, Wis.—Kissel Automobile Co., under Wisconsin laws with \$5,000 capital. Corporators—G. A. Kissel, W. L. Kissel, H. K. Bullerfield.

Appleton, Wis.—Appleton Garage Co., under Wisconsin laws with \$12,000 capital. Corporators—John Conway, T. W. Orbison, D. J. O'Connor.

Bridgeport, Conn.—Matthews Garage Co., under Connecticut laws with \$5,000 capital. Corporators—J. W. Matthews, Nelson F. Hunt, J. W. Walsh.

Pittsburg, Pa.—Forbes Motor Co., under Pennsylvania laws with \$10,000 capital. Corporators—E. H. Niedringhaus, L. Germain, Jr., H. N. Munhall.

Oklahoma City, Okla.—Southwest Motor Co., under Oklahoma laws with \$25,000 capital. Corporators—E. H. Eggleston, James S. Bryan, W. J. Black.

Buffalo, N. Y.—Chenango Auto Top Co., under New York laws with \$2,000 capital. Corporators—F. R. Hansell, John A. MacPeak, William F. Eidell.

Port Huron, Mich.—Case Auto Truck Co., under Michigan laws with \$40,000 capital; to manufacture motor trucks. Corporators—H. G. Barnum and others.

Abercrombie, N. Dakota—Richland County, Auto Co., under North Dakota laws with \$10,000 capital. Corporators—A. K. Twets, O. N. Hattie, J. B. Moe.

Indianapolis, Ind.—McCullough Motor Supply Co., under Indiana laws with \$10,000 capital. Corporators—Lester McCullough, Myrtle McCullough, C. C. Hauge.

Cleveland, O.—Cleveland Taxicab Service Co., under Ohio laws with \$100,000 capital. Corporators—C. S. Wachmer, F. B. Williams, B. A. Gage, R. A. Wilbur, J. B. Graham.

Chicago, Ill.—Dominick Automobile Co., under Illinois laws with \$10,000 capital; general automobile business. Corporators—William F. Dominick, George B. Wood, John W. Ross.

Chicago, Ill.—Locomobile Co. of America (a New York corporation), with \$5,000,000 capital; dealing in automobiles of its own manufacture. Corporators—A. J. Banta, Chicago, and others.

Westfield, N. J.—Martine Motor Car Co., under New Jersey laws with \$25,000 capital; to manufacture automobiles, bicycles, etc. Corporators—Levi D. and Harry C. Darby, George W. Frederick.

New York, N. Y.—Short & Wright, under New York laws with \$1,000 capital; to manufacture and deal in motor vehicles, etc. Corporators—Orville E. Short, Fred W. Wright, Samuel J. Fuller.

Syracuse, N. Y.—The Radell Co., under New York laws with \$1,000 capital; to deal in automobiles, mechanical devices, etc. Corporators—J. Emma L. Radell, William A. O'Brien, Arthur J. O'Connor.

New York, N. Y.—Auto Delivery, Inc., under New York laws with \$2,000 capital; to manufacture and deal in auto trucks and supplies. Corporators—Alexander Pell, Julius Mariany, Louis S. Elias.

Brooklyn, N. Y.—Fulton Auto Garage Co., under New York laws, with \$5,000 capital; to maintain and repair automobiles, etc. Corporators—E. J. Forhan, J. J. Harper, G. F. Martin, all of New York City.

New York, N. Y.—Crafts & D'Amora Co., under New York laws with \$3,000 capital; to operate garages, deal in automobile supplies, etc. Corporators—J. C. Leuze, Howard T. Graves, Joseph A. Mitchel.

New York, N. Y.—A. J. Myers, Inc., under New York laws, with \$25,000 capital; to manufacture and deal in carburetors, automobile supplies, etc. Corporators—A. J. Myers, Hugo S. Radt, Martin B. Cohn.

Chicago, Ill.—Factory Auto Supply Co., under Illinois laws with \$10,000 capital; to deal in automobiles, motorcycles, accessories and supplies. Corporators—George W. Stephens, William A. Conover, Spencer Ward.

Amityville, N. Y.—Long Island Automobile, Machine & Plumbing Co., under New York laws with \$15,000 capital. Corporators—Thomas Blyth, New York City; William E. Hulse, Amityville, L. I.; William F. Couran, Jr., Brooklyn.

Kingston, N. Y.—W. A. Wood Automobile Mfg. Co., under New York laws with \$3,000,000 capital. Corporators—William A. Wood, Charles W. Kahlerth, E. C. Dekay, Francis Fitch, Samuel S. Slater, New York

City; Frederick E. Moskowitz, Los Angeles, Cal.; Henry W. Johns, Ardsley, N. Y.

New York, N. Y.—Garage Equipment Co., under New York laws, with \$20,000 capital; to build and repair garages, etc., general engineering and machine work. Corporators—Samuel M., Annie W., and Emma W. Hodkinson.

Memphis, Tenn.—City Auto & Rubber Co., under Tennessee laws with \$10,000 capital; to deal in and repair automobiles, bicycles and rubber goods. Corporators—A. R. Woollen, J. H. DuBose, James T. Dolan, Frank Taylor, Robert Hulme.

Detroit, Mich.—Johnson Kellan Motor Sales Co., under Michigan laws, with \$10,000 capital. Detroit Carburetter Co., with \$25,000 capital. Oliver Motor Car Co., under Michigan laws with \$300,000 capital, Peninsular Gear Works, with \$60,000 capital.

Clinton, Mass.—Connery Transportation Co., under Massachusetts laws with \$10,000 capital; to deal in automobiles and supplies and operate a livery business. Corporators—James R. and William H. Connery, Clinton; James F. Stratton, Milford.

New York, N. Y.—General Motor Securities Co., under New York laws, with \$100,000 capital; to deal in government and industrial securities. Corporators—J. C. Matlack, Milltown, N. J.; C. R. Hatheway, Brooklyn; T. S. Merrill, New Rochelle, N. Y.

**Increases in Capitalization.**

Hartford, Conn.—Parker Motor Co., from \$50,000 to \$100,000.

Cincinnati, O.—Schacht Mfg. Co., from \$100,000 to \$500,000.

Milwaukee, Wis.—Johnson Service Co., from \$1,000,000 to \$1,500,000.

Detroit, Mich.—American Motor Castings Co., from \$100,000 to \$125,000.

Chicago, Ill.—Monarch Automobile Top & Supply Co., from \$2,500 to \$20,000.

**Buckeye to Make Gasolene Street Cars.**

The manufacture of gasolene operated street cars, with a carrying capacity of twenty-five passengers, has been added to the productions of the Buckeye Manufacturing Co., of Anderson, Ind., manufacturers of the Lambert friction driven car. The cars will be equipped with the Lambert patented friction transmission. An addition is being made to the factory, which will be devoted to the manufacture not only of these street cars but of commercial trucks.

**New Commercial Factory for St. Paul.**

Contracts have been let by the Schurmeier Motor Car Co. for the erection of an automobile plant at University and Hamline avenues, St. Paul, Minn. The building will be 50x150 feet, of brick, with steel trusses. The concern, formerly engaged in carriage production, is building a commercial car.

## IN THE RETAIL WORLD.

C. F. Elliston, Williamstown, Ky., has obtained the Ford representation for Whitley County.

Benson & Weideranders, Kearney, Neb., have purchased the business of the Kearney Automobile Co.

Manuel Bros. & Co., Richford, Vt., have taken possession of their new garage. It includes a repair shop.

A Regal branch has been established in Buffalo, N. Y., at 728 Main street. H. D. Van Brunt is the manager.

W. H. Flig, Waterford, Va., has entered the selling field and will undertake the introduction of Ford cars locally.

The E. M. Jennings Automobile Co., Bridgeport, Conn., has let the contract for its new garage on Fairfield avenue.

Formed to exploit Pierce-Racine cars, the Pierce Motor Co., of Brooklyn, N. Y., has established itself at 515 Greene avenue.

Houk & Gildow, Chillicothe, O., are having built a garage in the rear of the Warner House. Its dimensions will be 33x90.

Plans have been drawn for a new garage for the Autocar Co., Philadelphia, Pa., at Market and Twenty-third streets. It will cost \$125,000.

E. F. Anderson, Summit, N. J., is having built a concrete garage at Chestnut street and Park avenue. The building will be two stories, 50x50.

Charles W. Scott, Hillsboro, O., has embarked in the automobile trade and has secured the Brush and Maxwell agencies for Hamilton County.

The Pacific Motor Car Co., San Francisco, Cal., has located a branch in Oakland at Twelfth and Madison streets. A. E. Morrison will be in charge.

E. A. Benson, Audubon, Ia., has embarked in the automobile business, and has purchased the Burnside Building, which will be converted into a garage.

J. Z. Wilklow, South Bend, Ind., has let the contract for a garage south of the new hotel. It will be a one story building, constructed of pressed brick.

Charles Ham, Lonoke, Ark., has supplied that town's "long felt want," a garage and repair shop. It is a concrete establishment, 30x60, and is well equipped.

Griffin & Scott, Appleton, Wis., are having built a garage on Washington street, which will cost \$25,000. Their line consists of the Kissel, Cameron and Buick cars.

E. Y. Crockett, Atlanta, Ga., has disposed of his garage business at 68 Pryor street to the Fain-Hagle Co. The new proprietors will specialize on repairs and accessories.

Howard C. Robinson and A. J. Mills, Cleveland, O., have joined forces and opened a garage on Emily street. Mills formerly was manager of the Rauch & Lang Co.'s garage.

The Pacific Motor Car Co., Spokane, Wash., formerly at 1005 First avenue, has established itself in a new home at Maple and First streets. It has the Stevens-Duryea representation.

The Leachman & Claiborne Co. has been formed in Des Moines, Iowa, to specialize on rebuilding, repairing and storage. It is occupying a three story building at Eighth and Mulberry streets.

P. H. Haber, Fond du Lac, Wis., who is the local Ford dispenser, has leased the Hass garage on Macy street and will operate it under the title of the Ford Garage. Renting will be featured.

Contracts have been let by the Buick Auto Supply & Garage Co., Detroit, Mich., for the erection of a garage on West Grand Boulevard, near Cass avenue. It will be a two story structure, 100x250 feet.

Fitzsimmons Motors, Inc., is the style of a new concern in Atlanta, Ga., which has "opened up" at 45 Auburn avenue. It will act as distributor for Everitt cars in Virginia, Alabama, South Carolina and Florida.

The White-Robbins Co., Boston, Mass., has established itself at No. 459 Boylston street, where it will undertake the marketing of Babcock electrics and Sterling trucks. Both members of the concern hail from the west.

Having consummated a fifteen years' lease of the property, the Franklin Automobile Co., Cincinnati, O., is to have a new home erected for it at 1114-16 Race street. The building will be two stories and basement, 38x100, and will be built of concrete.

The Howard-Cregor Co., Nashville, Tenn., has placed a branch in Chattanooga, with temporary quarters in the Burk Automobile Co. garage, and which will be presided over by Eugene Howard. Chalmers, Hudson and Detroit electric cars will be exploited.

Consolidation of the Taxicab Co. of New Orleans (La.) and the Crescent City Automobile Co. has been effected, but the concerns will retain their individual names under the new regime. A new garage building is under way at Lafayette and Dryades streets and is expected to be ready by July 1.

Devoted exclusively to the needs of electric vehicles, the Electric Vehicle Co., Minneapolis, Minn., new garage at Hennepin avenue and Fifteenth street, was placed in commission last week; it is the second establishment of the sort in the Flour City. The building is two stories and basement, 47x125.

The Georgia Motor Car Co., Atlanta, Ga., has taken over the agency business of McLandon Bros., who represented the National, and who will continue with the company. The Georgia Company's line now consists of the Studebaker, E-M-F., National, Flanders, Benz and Randolph trucks,

and the concern contemplates entering the manufacturing field with a low priced car.

The Studebaker Minneapolis (Minn.) branch now is installed in its new eight story home at Sixth street and Second avenue, south, which is a model structure of its class. It is 125x50, the first two stories being constructed of white tile and the remainder of pressed brick, and the cost was \$125,000.

Portland, Ore., is to have a garage exclusively for electrics, which is being built for the Rose City Electric Co., on Twentieth street, between Washington and Everitt. It will be a one-story brick structure, 100x100, and part of it will be occupied by the Oregon Taxicab Co. The Rose City company handles the Babcock electric.

With the intention of eventually transferring its entire business to the new location, the Pence Automobile Co., Minneapolis, Minn., one of the largest dealers in the Northwest, has purchased a large tract of land at Washington and Eighth avenues, north. The plot, which is 222x150, changed hands for \$65,000. Work soon will be begun on a temporary warehouse which will cover the entire property, and plans are being made for an immense permanent building. The present Pence headquarters are at Hennepin avenue corner of Eighth street.

## Trade Association Moves Its Headquarters.

Headquarters of the New York Automobile Trade Association have been removed from 42d street to the Thoroughfare Building 1777 Broadway, which is in the heart of the gasoline section of the metropolis. Four new members were added to the roll at the last meeting of the organization, viz.: Fisk Rubber Co., Rothschild & Co., Thedford Auto Garage and the Correja Motor Car Co. These accessions bring the membership up to seventy-five, of whom thirty-five operate large garages, a fact which, according to the statement issued by the New York Automobile Trade Association, has caused the "major portion of those interested in the promotion of the proposed exclusive garage association to abandon the idea." And this despite the fact that the garage association only two weeks since was incorporated under the laws of New York.

## Steenstrup to Locate in Seattle.

"Pete, the Hyatt man," as a Detroit phraseologist last week styled Peter S. Steenstrup, the Hyatt Roller Bearing representative, in announcing that he had taken his rods and guns and gone for a long vacation, will not return to his old post. He has been appointed manager of a new branch which the Columbia Motor Car Co. is about to establish away out in Seattle, Wash. As Steenstrup is secretary of the Motor & Accessories Manufacturers, Inc., it follows that he will resign that office, also.

Some Features of the

# White Gasoline Car

which result in unusual  
Economy of Up-Keep

The White gasoline car is designed and built to run at a lower cost of up-keep, mile for mile, than any other car on the American market. Some of the factors which insure economy both in fuel consumption and in cost of maintenance are:

### Intake Gases Heated

By including the intake passages within the block engine casting, the intake gases are heated. As a result, every particle of gasoline is completely vaporized and each cylinder receives a uniform mixture of the proper richness, thus ensuring very low fuel consumption.

### Exhaust Gases Cooled

By water-jacketing the exhaust passages, the temperature of the exhaust gases is reduced as soon as they leave the cylinders. As a result, the pressure of these gases is greatly reduced and there is a minimum loss of power due to back pressure. This factor also results in low fuel consumption.

### Four-Speed Transmission

The direct drive is on third gear and practically all driving in town is done on this gear. For high-speed running, the fourth gear is used. There is, therefore, no racing of the engine and no undue strains upon it when the car is run at high speed. Furthermore, the engine may always be run at very close to its most economical speed.

### Valve Mechanism Enclosed

There is no chance for dirt and grit to work their way into the bearing surfaces and cause wear and faulty timing, as is the case when the valve mechanism consists of a series of external and unprotected springs, rocker-arms, push-rods, etc.

### Accessibility of Every Working Part

The cost of making an ordinary adjustment on any car is determined largely by the accessibility of the several parts. In the White, accessibility has been developed to a much greater degree than in any other car. For example, as there are no external manifolds, or no overhead valve contrivances, a valve may be removed for regrinding without removing or disturbing any other part. As another example, the magneto and water-pump are on opposite sides of the engine and are driven independently, so that either may be reached without disturbing the other.

#### The Ways of a "Wizard."

J. P. Morgan should feel proud! And why not? For has not the "Napoleon," the "wizard," etc., of the automobile industry paused in his wonder-working to repudiate the cruel reports which linked their names and enterprises? Is not such notice from such a source just cause for pride on the part of even such world figures as Morgan?

Who could have started those reports, anyway? Is it possible that Mr. Morgan or some of his agents did so? Can it be that they require such publicity? Surely it was not the new Napoleon or any of his agents! For he himself has denounced such publicity as "undignified" and regretted—deeply regretted—the publication of such reports. Yes, indeed, he has. His regrets are almost visible and his opinion of publicity—and the way to obtain it—are so well known to some persons that they will have small trouble in picturing the "wizard's" great mental

distress at any report that mixes his affairs with Morgan's.

When a man has a \$60,000,000 article on his hands and has had himself constituted the "pool" in which its stock is deposited in order that he may the better boost the value of the shares—under such conditions to link them with the Morgan name is most exasperating! It tends to scare off purchasers and to make investors timid! It is in every way injurious and deserves the denouncement and the deep regrets which are rendered so impressive when uttered by a Napoleon or even by a would-be Napoleon of any industry.

Mr. Morgan, however, is not alone in meriting felicitations. The constituent units of the General Motors Co. also are deserving of a share. For did not the chairman of its executive committee, after having been censured for making use of confidential data, actually ask and receive their permission to print the number of cars they have produced and accounted for in Selden royalties during the first quarter of this splendid year? How gracious the request! How gracious the consent! How truly Napoleonic! And how very informing! One of the companies has produced 22 vehicles, another 35 and still another 39, all during the short period of three months. It is not short of wonderful! The ten companies which so gracefully acquiesced produced an average of 1,100 cars during the 90 days—a record that should impress any investor. As not all of the constituent companies are listed, is it possible that the absent ones dared to refuse the chairman's request? Or—or is it possible that they have not produced anything and are "dead ones?"

The situation is distinctly touching. If the wizarding Napoleon is not careful he will bring tears to even the Schwarzkopian eyes of his special envoy and more or less official organ; and they may well be spared.

#### The Shipment of Replacements.

Merely to mention the subject of spare parts either to an automobile manufacturer or dealer is, in many instances, to touch upon a very raw spot in his business anatomy and possibly to open an old sore. While it is true that not a few motor car builders take great pains and equal pride in attending to the prompt dispatching of such replacements as may be requisitioned by their local representatives, it is an unfortunate fact that not all of them are in a position to do so; while others, it is

to be feared, are not as keenly alive as they might be to the importance of taking care of their agents in such a way as to enable the agents to take care of the customers just in the way they ought to be cared for.

Theory and practice are as widely separated as the seas, and the business man who succeeds in carrying out all the plans which he conceives, in just the way he aspires to do, is apt to be either a modern marvel or else devoid of proper ambition. But at the same time, there are certain considerations which make it appear very essential to strive in the matter of replacements with vigilance and persistency equal to that expended in the obviously important matter of original production. This the older and more successful makers have been doing as rapidly as they have been able to get their affairs in shape, and invariably with strikingly beneficial results. Among those who have not yet arrived at a satisfactory state in this particular respect there are not a few, doubtless, who are not in a position, or so they believe, to warrant concentrating a greater amount of effort on the parts sales business.

In order to develop a proper system of handling the requisitions of branches, agencies and private owners, close attention to detail, accurate accounting and a continuous inventory are necessary; also a well organized shipping department which is sufficiently familiar with the entire field to be able to route goods intelligently and rapidly. Further, while the service seems in a way to be secondary to that of the direct production and shipment of cars, and to be more in the nature of a promotion of the retailer's undertaking; it must be borne in mind that upon the good will of the latter his ability to develop his territory and strengthen his hold upon it depends. For his own sake the manufacturer must do what he can to keep his customers' cars on the road as much of the time as is possible, and to do this he can do no better than to begin by arranging to take care of the man who takes care of the man who runs the individual car upon the open road.

#### The Noise of the Motor 'Bus.

Like the aged and decrepit trolley car, the motor omnibus, in its most familiar present forms, promises to become a noteworthy addition to the noise-creating mediums of any great and growing city which happens to be progressive enough to sup-

port its presence. Such already has been the case in London and Paris, where the vehicle in question has come into its greatest popularity; and such is coming to be the case in New York City, where a certain proportion of the large number of foreign chassis which are in 'bus service have commenced to go into a groaning decline. The problem of reducing the noise in the commercial vehicle chassis, of this or any other sort, by no means is a trifling or fancied one. It is destined to become far more real and serious as time goes on and the number of such vehicles in constant service increases, as it is bound to do to a tremendous extent.

The great progress which has been made within the last two or three years in the reduction of noise in pleasure car practice lends a touch of probability to the hope that an equal measure of success may attend the efforts of commercial car manufacturers in a similar direction. The use of high grade materials of construction, proper heat treatment, grinding in of gears and proper provision for lubrication are points which must be taken into account with great care. Their consideration is a step in the development of the commercial vehicle which, up to this time, its builder has had little time to look into. Before long, however, it will be positively demanded because of the growing numbers of such machines and the increasing attention which the general public is bound to bestow upon them, in consequence of their increasing conspicuousness.

In this connection, the London General Omnibus Co. has ventured on a particular line of effort which, at the outset, appears to be meeting with a high degree of success. That is in the use of chains of the so-called "silent" type in the gearboxes of their omnibus equipment. Mechanically, the use of chains for this purpose presents no serious difficulties, while from the point of view of operation and maintenance, it is thought to hold a slight advantage over the simpler and constructionally less expensive spur gear system. The main point in its favor, from the point of view of the public, however, is that, practically speaking, it is noiseless. This is a big advantage in public service work, and one which is destined to increase in comparative importance in the future. Generally speaking, the noise of the mechanism is about the last thing the commercial vehicle designer would re-

## COMING EVENTS

May 5-7, Richmond, Va.—Richmond Times-Despatch endurance run.

May 5-7, Atlanta, Ga.—Opening spring race meeting on Atlanta motordrome.

May 6-7, Santa Rosa, Cal.—Santa Rosa Automobile Association's race meet.

May 7, Chicago, Ill.—Chicago Automobile Trade Association's floral parade.

May 9, Santa Rosa, Cal.—Santa Rosa Automobile Association's second annual road race.

May 9-11, Harrisburg, Pa.—Motor Club of Harrisburg's fourth annual reliability contest.

May 10-11, New York City—Motor Contest Association's reliability contest to Atlantic City and return.

May 11, Birmingham, Ala.—Birmingham Police-Relief Association's race meet at state fair grounds.

May 13, Denver, Colo.—Automobile races at Overland Park.

May 13-14, New York City—Motor Racing Association's 24 hours race at Brighton Beach track.

May 14, Kansas City, Mo.—Automobile Club of Kansas City's hill-climb on Dodson hill.

May 14, Vicksburg, Miss.—Vicksburg Automobile Association's hill climb on Mackey's hill.

May 18, Cheyenne, Wyo.—Cheyenne Motor Club's race meet on motordrome.

May 18-19, Norristown, Pa.—Norristown Automobile Club's third annual endurance run to Scranton and return.

May 19, Chicago, Ill.—Chicago Motor Club's second annual demountable rim test.

May 19-21, Hartford, Conn.—Automobile Club of Hartford's All-Connecticut reliability contest; 600 miles.

May 22, Fort Worth, Tex.—Fort Worth "Star-Telegram" endurance run.

May 22-23, Brooklyn, N. Y.—Crescent Athletic Club-Long Island Automobile Club amateur touring contest on Long Island for Pardington trophy.

May 25, Columbus, O.—Columbus Automobile Club's reliability run to Indianapolis, Ind.

May 27, 28 and 30, Indianapolis, Ind.—Grand Circuit meeting and national championship races on Motor Speedway.

May 27-31, Washington, D. C.—Washington "Post" five days endurance run to Richmond, Va., and return.

May 28, White Plains, N. Y.—Amateur Automobile Contest Association's hillclimb.

May 28-31, Syracuse, N. Y.—Central New York inter-club relay run.

May 29-30, San Francisco, Cal.—San Francisco Motor Club's two days race meet at Tanforan.

May 30, Bridgeport, Conn.—Bridgeport Automobile Dealers' Association's hill-climb on Snake hill, Fairfield.

May 30, Denver, Colo.—Denver Motor Club's road race.

May 30, Briarcliff Manor, N. Y.—Amateur Automobile Contest Association's hill-climb.

May 30, Denver, Colo.—Denver Motor Club's annual road race.

June 1, Berlin, Germany.—Start of Prince Henry tour, finishing at Homburg on 8th.

June 2, New York City—Annual Orphan's Day outing at Coney Island.

June 3-4, Buffalo, N. Y.—Automobile races at Fort Erie track.

June 4, Worcester, Mass.—Automobile Club of Worcester's annual hillclimb on Dead Horse hill.

June 6, Atlanta, Ga.—Start of second annual New York-Atlanta Good Roads Tour, ending in New York June 14.

June 7, West Haven, Conn.—Yale Automobile Club's third annual hill-climb on Shingle hill.

June 11, Newark, N. J.—New Jersey Automobile and Motor Club's 280 miles reliability run.

June 11, Portland, Ore.—Portland Automobile Club's annual road race for Wemme Cup.

June 11, Wilkes-Barre, Pa.—Wilkes-Barre Automobile Club's annual hill climb on Giant's Despair.

June 15-30.—American Automobile Association's seventh annual national touring and reliability contest for the Glidden trophy, starting from Cincinnati and finishing at Chicago.

June 16-22, Albany, N. Y.—Albany Automobile Club's sixth annual tour to Atlantic City, N. J., and return.

July 1, 2 and 4, Indianapolis, Ind.—Grand Circuit meeting on Motor Speedway.

July 2, Wildwood, N. J.—North Wildwood Automobile Club's roadability run from Philadelphia to Wildwood.

July 4, Wildwood, N. J.—North Wildwood Automobile Club's annual beach race meet on Ocean Drive.

August 6, Wildwood, N. J.—North Wildwood Automobile Club's beach race meet on Ocean drive.

gard himself bound to consider; actually it may have a not inconsequential bearing on the reputation of his product, if not on

its wearing qualities—of which the amount of noise developed may be supposed to be a fair indication.

## GUESSING SEASON IS INAUGURATED

**Quakers Start the "Who's-Got-the-Button" Game—Longstreth Gets a Silver Cup as the Best Guesser.**

The season for "guessing contests" was inaugurated on Saturday last, 30th ult., and in Philadelphia, where they originated. The Quaker motorists evidently like to throw off the cares and responsibilities of grown-ups occasionally as more than 100 of them participated in the third annual roadability—or, more properly, "guessability"—contest of the Quaker City Motor Club from Philadelphia to Atlantic City, N. J., on Saturday last.

Whether because of previous practice or natural ability the guessing was unusually close, the winner turning up in W. C. Longstreth, who drove an Alco car, and who made the run of 68.2 miles in 3:36.05. This was a variation of but  $4\frac{1}{2}$  seconds from the official secret time of three hours, thirty-six minutes, nine and one-half seconds which was set by Mayors Reyburn of Philadelphia and Stoy of Atlantic City. Longstreth accordingly was awarded the mayors' cup for his "strenuous" performance and mind-reading.

Longstreth was closely pressed—or guessed—by Charles J. Swain in a Winton, who finished in 3:36.02 $\frac{3}{4}$ , only  $2\frac{3}{4}$  seconds behind. Swain captured the Hotel Strand cup. Third prize went to B. F. Richardson in a Mitchell, who tied with H. C. Rosen, Cadillac, both having guessed 39 $\frac{1}{4}$  seconds out of the way. Lots were down to break the tie and Richardson was the lucky one; Rosen was awarded fourth prize. The other remaining trophy went to Frank Fanning, who drove a Thomas. The first five awards were silver cups.

Nearly every contestant, however, received a prize of some sort, there being five classes designated, from A to E, and the first twenty in each class who finished nearest to the winners' times were given the choice of clocks, cut glass, smokers' articles and similar things. There also were divisions for manufacturers' cars arranged on a price basis, three awards being given to the makers having the greatest number of cars in their respective classes. Class 1, for cars costing \$3,500 and over, went to the Stearns company, which was represented by five machines. Winton cars were the winners in Class 2, for machines costing from \$2,000 to \$3,500, mustering five cars, and Class 3, for cars selling under \$2,000, was a Buick triumph.

The excellent weather contributed largely to the success of the contest, and the roads were in fine shape after the rain of the previous night, which laid the dust and packed the soil firmly. But few mishaps occurred along the route, 91 participants

checking in at the finish. The start was made from the Hotel Walton at 1 p. m. sharp, the cars being sent away at half-minute intervals. As each car left the driver was handed a card bearing its starting time and upon reaching its destination the finishing time was inscribed on it. The cars were gaily decorated with pennants bearing the club and other colors and made a pleasing appearance as they rolled along. Among the contestants was the Regal "Plugger," which is on a 5,000 miles demonstrating tour around the country; it finished well up in front. After the last car had checked in the cars were parked on the million dollar pier, where Mayor Stoy announced the winners and awarded the prizes.

### Cobe Cup Race to Be Run on Track.

All hopes that the Cobe cup race this year would be a road contest were shattered this week by the announcement from Chicago that the Chicago Automobile Club had decided to stage the 1910 race on the Indianapolis Motor Speedway on July 4. In order to land the contest the speedway management submitted a proposition to President Cobe of the club and donor of the trophy, offering the club a percentage of the gross receipts on the day of the race, and at a meeting of the board of directors this offer was accepted. This action decisively knocks the underpinning from the Chicago speedway projects which were discussed and which now are said to have been abandoned for this year at least. By their coup in securing the Cobe race the wide-awake Hoosier promoters have stolen a march on their rivals, and together with their other rich prizes seem to have compiled the red letter track program of the year.

### Native Car Scores on Georgia Grade.

First honors in the automobile hillclimb held at Dublin, Ga., on the 28th ult., and an event of the season in the little Georgia town, were captured by a native product, the White Star, an Atlanta made car, which, driven by Eberlein, topped the hill in 35 seconds. Second place was closely contested and resulted in a tie between Marshall, piloting a White, and Meller, in a Buick, both of whom made the climb in 37 seconds. Bashinski drove an Ohio up the hill in 40 seconds, and the last man was Marshall, E-M-F., who required 42 seconds for the trip. The tie was not run off.

### Munn Heads Texas Association.

Directors of the Texas State Automobile Association, at a meeting held in San Antonio, following its incorporation, elected the following officers: J. W. Munn, Galveston, president; A. H. Evans, Eagle Pass, first vice-president; R. E. McKie, San Marcos, second vice-president; W. W. Seley, Waco, third vice-president; R. W. Carr, secretary-treasurer. The full board will hold its next meeting in the city of Galveston, August 2.

## GOOD SPORT AT SAN FRANCISCO

**Oldfield Turns Several Swift Miles, but King is Biggest Winner—Two Sensational Accidents Occur.**

With excellent weather, large crowds and prompt work in running off the events, the two days' race meet held on the Ingleside mile dirt track near San Francisco, Cal., Saturday and Sunday, April 24th and 25th, proved a successful affair. The meeting was promoted by the Islam Temple of the Mystic Shrine, and the presence of several well known drivers and cars was responsible for a crowd of 4,000 people on Saturday afternoon, and the excellence of the racing on that day caused about 10,000 persons to visit the track on Sunday, the closing day of the meet.

Although "Me & My car" were billed as the features, the greatest interest centered in several close finishes provided by drivers in the stock car events. Several of the finishes were of the bonnet-to-bonnet order. The track was soft in spots, but despite this fact Oldfield managed to drive a mile exhibition in 51.56 seconds, which, however, is slower than Ralph DePalma's mile at Minneapolis, Minn., last year; DePalma's time was 50 $\frac{1}{4}$  seconds—the fastest ever recorded on a mile dirt track.

The largest individual scoring at the meet was made by Maxwell cars, which won four events, finished second once and third twice. Knox cars also figured well.

Saturday—April 24.

The best sport of the first afternoon's racing was furnished by smaller cars in the stock car events. In the race for cars selling for between \$1,200 and \$1,600, C. O. King in a Maxwell and George Nelson in an Oakland fought it out for every foot of the 5 miles, the former winning by a narrow margin. Again in the five miles free-for-all handicap King and Nelson hooked up at several stages and finished in the same positions as in the first race.

Oldfield and his side partner, Kircher, competed in a handicap match in which Oldfield, driving a Knox, was allowed 8 seconds handicap in two miles, by Kircher in the big Darracq. Oldfield won the first heat and might have won the second had he not loafed in the homestretch, for Kircher to come up and make a close finish. As a result Kircher won. Oldfield, however, won a 10 miles handicap, driving a Knox, and drove a mile against time in 52 12-100 seconds, while Kircher turned a mile in 54 9-100 seconds. The summaries:

One mile, for "Brownie cars"—Won by Robert McNight; second, Lloyd Schully. Time not taken.

Five miles free-for-all, for motorcycles—Won by Charles Balke, Thor; second, W.

G. Collins, Indian. Time, 4:43 16-100.

Five miles, for cars listing at \$1,200 and under—Won by Joe Nickrent, Buick; second, A. Ruddle, Ford; third, Frank O'Brien, Ford. Time, 5:29 94-100.

Five miles, cars listing between \$1,200 and \$1,600—Won by C. O. King, Maxwell; second, George Nelson, Oakland; third, T. F. Holmes, Maxwell. Time, 5:37 52-100.

Five miles, cars listing between \$1,601 and \$2,000—Won by Frank Murray, Buick; second, Walter C. Morris, Autocar. Time, 5:33 75-100.

Five miles free-for-all handicap—Won by C. O. King, Maxwell; second, George Nelson, Oakland; third, Walter C. Morris, Autocar. Time, 5:18 35-100.

Two miles handicap match—First heat won by B. Oldfield, Knox; second, B. Kircher, Darracq. Time, 2:22 56-100. Second heat won by Kircher; second, Oldfield. Time, 2:02 90-100.

Ten miles free-for-all handicap—Won by B. Oldfield, Knox; second, Walter C. Morris, Autocar; third, Frank O'Brien, Ford. Time, 11:08 2-100.

One mile time trials—Won by B. Oldfield, Benz, 0:52 12-100; second, B. Kircher, Darracq, 0:54 90-100.

#### Saturday, April 25.

With 10,000 persons looking on, the second day's meeting went well until the final race of the afternoon, when a spectacular accident occurred in which William Nelson nearly lost his life. The event was a 5 miles handicap for members of the Mystic Shrine, and young Nelson, together with his father Fernando Nelson, were among the entrants. William Nelson was making the upper turn when one of the front wheels of his car collapsed, and in less time than it takes to tell, the car had broken through the strong outer railing and plunged down an embankment. A. B. Bright, the mechanic, was thrown from the car but landed in a soft spot and escaped with a sprained wrist and a lacerated right knee. But Nelson was not so fortunate. His worst apparent injury was a circular cut to the bone around the right eye, which required 130 stitches to close. He was also badly bruised and lacerated and, it is feared, sustained internal injuries. The race was won by W. T. Warren, Matheson.

Another exciting incident happened in the 10 miles free-for-all handicap—one of the big events of the afternoon. Kircher in his big Darracq was behind Oldfield's Knox and he was reeling off a sizzling pace in an endeavor to cut down the lead of the field. He followed Oldfield for nine of the ten miles, and when rounding the turn into the last mile his steering knuckle broke. Kircher went through the muslin inside fence and the front wheels spread, causing the axle to dig into the ground. The machine stopped within 30 feet, but Kircher kept right on going. He executed two beautiful somersaults in midair and landed without

turning a hair. A few minutes later he was traveling around with Oldfield as serenely as though nothing had happened. The race was won by C. O. King, Maxwell, after an exciting battle against Frank Murray, Buick. King also scored a pretty win in the five miles free-for-all handicap. The summaries:

Five miles free-for-all, motorcycles—Won by W. G. Collins, Indian; second, Charles Balke, Thor. Time, 4:46 51-100.

Five miles match, motorcycles—Won by Charles Balke, Thor; second, W. G. Collins, Indian. Time, 4:37.

Five miles, cars listing at \$1,200 and under—Won by Joe Nickrent, Buick; second, Norman Cowan, Ford. Time, 5:56.

Five miles handicap, private owners, for members of the Mystic Shrine—Won by W. T. Warren, Matheson; second, Palmer-Singer. Time, 6:08.

Five miles, cars listing between \$1,200 and \$1,600—Won by George Nelson, Oakland; second, C. F. Hoag, Maxwell; third, A. Ruddle, Ford. Time, 5:32 75-100.

Five miles, cars listing between \$1,600 and \$2,000—Won by Frank Murray, Buick; second, Frank Free, Autocar. Time, 5:58 28-100.

Five miles free-for-all handicap—Won by C. O. King, Maxwell; second, George Nelson, Oakland. Time, 5:10 30-100.

Four miles handicap match—Won by B. Kircher, Darracq; second, B. Oldfield, Knox. Time, 3:56 98-100.

One mile time trials—B. Oldfield, Benz, 0:51 56-100 and 0:52 21-100; B. Kircher, Darracq, 0:53 56-100.

Ten miles free-for-all handicap—Won by C. O. King, Maxwell; second, Frank Murray, Buick; third, Walter C. Morris, Autocar; fourth, B. Oldfield, Knox. Time, 8:36 85-100.

#### Twelve to Start in 24 Hours Race.

With many of the veterans of former twice-around-the-clock contests again entered, as well as several new aspirants for honors, the entry lists for the opening 24 hours race of the season at Brighton Beach track, New York City, on May 13-14, closed this week with 12 nominations, the full quota which will be permitted to line up for the long journey. Among the old timers who again will come to the scratch are a pair each of Stearnses and Buicks, while the representatives of the Ranier, Fiat, Marion, Simplex, Houghton-Rockwell, Selden, Croxton-Keeton and Cole will pin their faith to a single car each. The three last named are making their debut at this style of racing. Significant by their absence, the Loziers, which last fall established the present record of 1,196 miles, prefer to rest on their laurels for the present. A new scoreboard is to be erected in front of the grandstand to keep the "fans" informed as to the drivers who are on the track at all times, and the inner pole will be marked by the usual cloth fence, which at night will further be indicated by

green lights instead of the usual red ones. The latter change was made to avoid any possible accidents by the drivers confusing the tail lights of leading cars for the pole lights. As usual, "fabulous sums" will be spent in rebuilding the track, which, of course, is expected to prove "faster than ever." Although no announcement to the contrary has been made, the coming race will differ from its predecessors in that it will be a free-for-all event instead of being open to stock cars only.

#### "Guessability" on Relay Plan.

Although automobile relay races are unpopular in certain sections of the country since one contest of the sort which was attempted last year was stopped by the authorities because of a fatal accident, the official organ of the New York State Automobile Association is arranging an inter-club relay, from which, so it is announced, the speed menace will be eliminated. The affair will start from Syracuse, May 28, and embrace the large cities in the central section of the state. Local clubs will furnish the relays in their territories, the route lying through Auburn, Cortland, Ithaca, Watkins, Elmira, Owego, Binghamton, Oneonta, Cooperstown, Richfield Springs, Utica, Rome, Oneida and back to Syracuse. It is planned to have the contest occupy three days and finish on Memorial Day. Inasmuch as there will be secret time schedules for each leg of the run, it really will take that form of infantile motoring amusement known as a "guessability" run, but distinguished from the ordinary kind by the relay feature.

#### Work Stops on Narragansett Track.

Work on the conversion of the Narragansett Park mile dirt track at Providence, R. I., into a motordrome, which has been in progress for several months, ceased suddenly last week, and from the reticence of the promoters regarding their future plans it seems probable that the projected speedway will not be completed. Several thousand dollars already has been expended in preliminary work, and the course has been plowed and made ready for the filling and top foundation. The Rhode Island Automobile Club has a two days' race meet billed at the track on September 9-10, and unless the course is in condition by that time the meeting probably will be abandoned, as there is no other suitable oval to be had in the state.

#### New York Registrations Pass 100,000 Mark.

The registrations of New York State this week passed the 100,000 mark, that number being assigned to Peter Barlow, a New York City magistrate. While the registrations apparently stand for 100,000 separate cars, very many represent cars that have changed hands several times, while probably one-third of the number long since were consigned to the junk pile.

**MOTORISTS AS ROAD IMPROVERS**

**Louisianans Do More Than Talk—Give Money and Support Convicts and Provide Fine Object Lesson.**

While the movement for better roads has attained great headway all over the country, and automobile organizations have added impetus to it, it is doubtful if any of them

In Louisiana the Governor has a right to furnish convicts for other work than on the cotton and sugar plantations of the state as long as they are not leased. On these farms they have paid their own expenses, but at times there are more convicts than are necessary, so in conjunction with the automobilists it was arranged by the state authorities late last fall to organize camps of twenty-four negroes each for work on the roads. The white prisoners are used

a week; the state agreeing to furnish the camp equipment, consisting of a commissary wagon, one or two berth wagons, a portable screened jail and such tents and other outfit as was necessary.

On February 21st of this year the actual work on this roadway was started and the first formal inspection took place on April 17th. In just about two months, working six days a week, the convicts have dug ditches and graded and crowned roads for a distance of about four miles, from Gentilly Road to Michoud Station, and they have given positive assurance of the success of this great undertaking. It is estimated that it will take eight months longer before the preliminary or comparatively rough work is completed, and perhaps within this time they may have an opportunity of putting on the top coat, which will be one of gravel with a heavy dressing of asphaltum oil.

The state and city officials recently drove in motor cars over four miles of recently constructed surface at a lively clip, and the new road appeared to be particularly solid and well drained. But beyond the point to which the improvements have at present reached there are miles where an automobile would be useless, and, indeed, one of the cars sank so deeply as to necessitate taking it out. This was an apt illustration of the "before and after treatment" and showed the necessity for the enthusiasm now abounding.

The Motor League has paid for the plows, scrapers and other machinery and a large

NEW CHEF MENTEUR ROAD SHOWING SMOOTH GRADING AND CAMBRE

ever went to such length as the Motor League of Louisiana, a state in which good roads are few and far between.

Having convinced the state authorities of the desirability of utilizing the work of its negro convicts in building better roads, the Motor League took up the practical solution of the problem. For the sake of an experiment and in order to show exactly what could be done in the matter of road construction, the old trail leading from New Orleans to Chef Menteur, the origin of which dates back more than eighty years, was chosen for improvement. When the route was announced, the failure of the plan was at once predicted because the road was at that time practically an impassable swamp and lay through a country of luxuriant southern foliage, where splendid live oak trees and hanging Spanish moss formed an archway overhead. The estimated cost of the improvement was placed at \$30,000 and the Motor League endeavored to raise the money among its members. Seven members subscribed \$100 each and this money was used in surveying the road. City Engineer Hardee, who superintended the survey, reported favorably on it, and the City Council then appropriated \$2,000 for preliminary experimentation. The Mayor gave his assurance that if the road was built it would be maintained by the city, as its eighteen miles are within city limits.

CHEF MENTEUR HIGHWAY IN ITS UNIMPROVED STATE

in the commissary department and all of the men are watched by armed guards.

The Motor League agreed to take such camps of twenty-four negroes each and to pay for all feed, the salary of the armed guards, one-half of the cost of the resident engineer, and the fee of the visiting physician who inspects the prisoners three times

number of the members have contributed between \$100 and \$200 each to assure the furtherance of the operations. Their success is leading other parishes to inquire about the movement and Governor Sanders has assured them that any one in the state may receive organized camps of convict labor.

## OFFENSE THAT CAN'T BE PUNISHED

**Connecticut Lawmakers Meant Well but Provided no Penalty—Motorists with But One Tag Are Freed.**

Although the Connecticut automobile law which was passed last year specifically provides that all cars licensed in accordance with its provisions shall carry two number plates, the framers of the measure neglected to insert provision for a penalty to be imposed for violation of that particular clause. This point having been clearly established at a special police court hearing in Bridgeport, recently, a bunch of nine defendants, held jointly for trial on the charge of displaying but one marker on their cars, was discharged by Judge Carl Foster.

The case rather relieves the anxiety which developed in the breasts of some motorists living outside the Connecticut boundaries, but who occasionally motor across them, when Attorney-General Holcomb voiced the opinion, a few weeks ago, that the two-tag provision applied to all cars used within the state, irrespective of the residence of their owners. As a matter of fact, it would seem to have settled the point absolutely, since no less than five of the nine defendants in the test case came from New York State.

Acting on orders issued by Mayor Buckingham, the local police arrested as violators of the automobile law the following: Elgin Davis of Bridgeport, Fire Commissioner F. A. Strong, Henry H. Sprague, Robert Butt of Brooklyn, James Dennis, William Taylor of Yonkers, Edward Hannon of New York City, John B. Stevenson, chauffeur for Henry Burr, a Fairfield County millionaire, and F. C. Farrell of Brooklyn. In each the offense was that of displaying but one tag instead of the two prescribed by the law.

Assistant Prosecuting Attorney Redden asked Judge Carl Foster for a conviction and fine in each case. Foster ruled that ignorance of the law was no excuse, and fined each man \$5. Before they could pay their fines, however, someone stepped in and asked under which provision of the statute the fine was imposed. A hurried search through the laws showed no clause authorizing any punishment. A later and more careful scrutiny had the same result. Judge Foster then pleaded "ignorance" and discharged all the prisoners, first remanding the fines.

### "Statesmen" Scuttle Schultz's Bill.

As a result of the storm of protest which arose as soon as its true purpose was disclosed, Senator Schultz, of New York City, and practically all of the other statesmen who were in any way concerned with the introduction of the so-called Schultz bill have made haste to "stand from under." In

consequence, the measure which was drawn in the interests of a few Brooklyn horsemen who wished to preserve the use of the speedway on Ocean Parkway leading to Coney Island, has been recommitted in both houses, and is looked upon as finally buried. Senator Schultz and the others have been very apologetic since the true nature of the bill was explained to them and have given assurance that had they known that the bill was so framed as to permit any park commissioner to close any thoroughfare under his jurisdiction to automobiles, they never would have thought of supporting it.

### No More Smoking in New York City.

By an amendment to the smoke ordinance section of the sanitary code, the Board of Health of New York City has adopted a measure rendering it unlawful for automobiles to emit smoke while on the city streets. The new rule, which was passed on Thursday last, 28th ult., practically extends to all streets the same provision which heretofore has been effective in thoroughfares under the jurisdiction of the Park Department only. The new rule will go into effect on July 1 next, prior to which notices of its enforcement will be sent out to all owners, dealers, manufacturers and garagemen. In the meantime, with a view to securing a fair adjustment of the motorists' cause and to prevent police oppression in the enforcement of the rules, the Licensed Automobile Dealers' Association of the City of New York has appointed a committee to confer with Health Commissioner Lederle.

### Another Advantage of Electricity.

One marked advantage of using electric lights on the car is the facility which it provides for the adoption of a portable inspection lamp. Where such a lamp is used on a car designed to carry batteries for ignition purposes alone, of course a considerable length of flexible cable is required in order to provide means of access to all parts of the machine. But where the car is wired for electric lights, it follows that, with a relatively short length of cable and a socket plug of standard type, it is possible to connect in the inspection lamp at any one of no less than five points about the machine, permitting free use of the lamp.

### To Prevent "Catching on Behind."

When driving in the city, operators should take pains to see that unused trunk racks are folded and well secured. Unless this precaution is taken the ubiquitous small boy is apt to find a secure and comfortable resting place on the rack, where, if the top happens to be down, he is perfectly concealed from the driver. Besides tending to work injury to the finish of the tonneau, such ride stealing exploits are quite apt to result in injury to the youngsters, not infrequently causing inconvenience and delay to the driver of the car, even though he may be wholly blameless in the matter.

## A. A. A. ELECTS A NEW SECRETARY

**Elliott Resigns and Is Succeeded by Bruce —Other Transactions at Meeting of Executive Committee.**

The American Automobile Association has a new secretary, Robert Bruce, of New York City. He was elected to the office at a meeting of the executive committee held on Tuesday last, 3d, and succeeds Frederick H. Elliott, who, after more than three years' faithful service, resigned to become secretary of the so-called Touring Club of America, the New York proprietary corporation, which enlists "subscribers" as distinguished from voting members.

For several years past Bruce has been engaged in Blue Book work and is therefore well posted on roads and touring matters. He is an earnest, studious, methodical man who knows how to apply himself to any task he may take in hand.

Charles Thaddeus Terry, chairman of the legislative board, who was present, reported his intention of going to Washington to look after the fate of the Federal registration bill, which, despite the assurances of the lawmakers to the contrary, has been allowed to slumber throughout the present session. A delegation from the Chicago Motor Club, having in charge a petition carrying over 5,000 signatures secured in Congressman Mann's district, is about to press the matter with Mr. Mann, who is chairman of the Interstate and Foreign Commerce committee, which has had the measure in charge.

From Governor T. M. Campbell of Texas, Mayor S. J. Hay and the Board of Trade of Dallas an invitation was presented urging Chairman Butler to include the State of Texas, and the city of Dallas in particular, in the itinerary of the forthcoming Glidden tour. The pathfinder, who has already moved on into Kansas, has included Texas in that part of the Glidden map already plotted. The week of June 6 was officially designated as "Orphan's week" for the A. A. A. clubs.

Among those present were President L. S. Speare, First Vice-President Robert P. Hooper of the Automobile Club of Germantown, Powell Evans, chairman Touring Information Board and president of the Automobile Club of Philadelphia; A. H. Knoll, Automobile Club of Buffalo; J. H. Edwards, Automobile Club of Hudson County, N. J.; H. A. Bonnell, New Jersey Automobile and Motor Club; A. E. Lerche, Automobile Club of Springfield, Mass.; S. A. Miles, National Association Automobile Manufacturers; A. G. Batchelder, chairman executive committee; Charles Thaddeus Terry, chairman legislative board; S. M. Butler, chairman contest board, and Robert Bruce, the newly elected secretary.

**"PLUGGER" ARRIVES IN NEW YORK**

**Mile-Hunter from Michigan Pays a Visit and Goes On—Its Picturesque Appearance and Record.**

Splashed with the mud of many states and its body panels "tattooed" with a motley collection of hotel labels, advertising stickers, initials and other decorations which attest to its wide travels, the Regal "Plugger," which left the Regal factory in Detroit, Mich., on April 11, on a 5,000 miles "plug" among the Regal representatives,

"circle." Its total mileage is said to be 18,000, and it brought back to New York the travel stained American flag which former Mayor McClellan presented to it at the start of its transcontinental trip last year. After resting for a day, the car started on the second leg of its trip, which includes Philadelphia, Pittsburg, Wheeling and back to Cleveland. Leaving the Forest City, the wanderers will "leave their cards" at Kansas City, St. Louis and Minneapolis.

An opportune arrival in Philadelphia on the 30th ult. permitted the crew to participate in the Quaker City Clu's "guessability" run to Atlantic City, and the battle-scarred car furnished quite a contrast to the other 100

**GLIDDEN ROUTE IS LENGTHENED**

**Omaha's Plea Is Heeded, Which Adds Another Day—Pathfinders Now Near to the Turning Point.**

Strenuous indeed has been the past week in the peregrinations of the Glidden pathfinders who are exploring the great Southwest, laying out the route which the great national caravan will traverse next June. Worn by the racking and exhausting efforts of the previous week's battles with mud and swollen rivers, Driver Joe Gardham succumbed to the scorching heat of the Texas plains near Decatur Tex., on Saturday, 30th ult., and was prostrated at a ranch nine miles from that town. After a good rest, however, he was able to take the wheel again on the following day and the scouts made Lawton, Okla., on Saturday night.

Good roads on Sunday enabled the pathfinders to progress to the extent of a hundred miles, and that night they enjoyed the hospitality of Enid, still in Oklahoma. Another good run on Monday, 1st, brought the loggers into Kansas, the prohibition state, and they put up for the night at Wichita, the day's mileage being 120. Over 1,800 miles of the tour have been mapped out at this writing, but after reaching St. Joseph, Mo., the scouts will deviate from their original schedule in compliance with instructions from Secretary Butler of the American Automobile Association.

Returning from California, Secretary Butler stopped off at Omaha, Neb., and after President W. R. McKeen of the newly organized Nebraska State Automobile Association had his ear for a few minutes he succeeded in convincing the A. A. A. official that Omaha's recent efforts in behalf of the A. A. A. should be recognized by switching the tour that way for a night stop. Accordingly, Dai Lewis, who is plotting the route, received instructions to include Omaha in his itinerary, so the pathfinders now are headed that way and will not arrive in Chicago, the end of the tour, as soon as expected. By the same token the route will be longer than at first announced, which will add an extra day to the tour. The new stretch commences after leaving St. Joseph and the original route will be picked up again at Des Moines, Ia.

**Motor Stages for Famous Battlefield.**

The directors of the Chambersburg, Gettysburg and Waynesboro Electric Railway intend to operate an automobile line between the terminal of the line and the Gettysburg battlefield. They propose to purchase several large passenger automobiles and inaugurate a regular schedule between the two places.

REGAL "PLUGGER" LEAVING NEW YORK FOR PHILADELPHIA

rolled into New York City on the 28th ult., escorted by an enthusiastic party of local Regal owners headed by Manager E. S. Hilton of the metropolitan branch. The car is driven by Lee Cuson and R. W. Dean, factory representatives, and on reaching the metropolis completed the first lap of its schedule, 1,335 miles, having visited Toledo, Buffalo, Rochester, Syracuse, Albany, Boston and Providence in that order since leaving its home city. According to its routing, it will have crossed 14 states and touched 64 cities when the circuit is completed.

The car first began its long distance stunts last July, when it made a transcontinental trip from New York to San Francisco, 4,032 miles, in 30 days, and is said to have piled up an additional 11,281 miles in demonstratng work in the interval between the finish of its ocean-to-ocean jaunt and the present girdling of the Regal

spick and span machines. True to its name, the "Plugger" plugged along consistently and checked in well inside the time limit.

Regarding its extensive travels the car "speaks for itself," for one has but to glance at the hood and body to learn its past career. On the hood and tonneau panels are signs telling of its 'cross-continent ramble and the mileage, and this respectable jaunt in itself is considerably swelled when the eye rests on the side panels of the front seats, where "all who run"—or walk, either—may read of its extensive demonstrating service. Each tonneau door is embellished with the Regal "Plug-o-meter" and the distance of the present trek. Significant of the road conditions which are met, the shovels and rope which are carried on the running board are impressive evidence that there still remains much unimproved "high-way" in this wide land.

## AUTOMOBILES FOR EVERYBODY

**Bright Young Man Offers "Any Make" on Instalments—No Security Required—Prospective Purchaser's Experience.**

To coin a more or less legitimate word, "autotopia" has arrived, that long expected day when any man, however humble, can purchase an automobile for "so much down, so much per week," that happy day "has come" at last—that is, it has come unless the plans and projects of one Guernsey Stevenson go sadly awry.

Stevenson, a very nervous young man of 30 or 32, who lived interestingly in Philadelphia before coming to the bigger city, is operating as the Terminal Auto Co., in the basement arcade of the Hudson Terminal Building in New York, and it is there the seeker for automobiles "on easy payments" must betake himself.

Stevenson really hoped to have the glad news spread to the wide, wide world ere this. He had prepared fine, large advertisements for a large number of daily papers, but somehow or other they have not yet appeared—due, however, to no unwillingness on the part of the former Philadelphian. He still is hoping that others will do as one Jersey City publication has done—i. e., print his advertisement and let the dear public know where "any make of automobile on instalments," may be procured. That is the tenor of his ad. and of his business cards, which, however, do not bear his name.

When the Motor World man called at the Terminal Auto Co.'s "salesrooms," Stevenson was absent, but as the office boy said he would return shortly, the visitor decided to wait, and was shown to a chair in the private offices. The "salesrooms" consist of a plush-rope space, nine-tenths of which is occupied by a Western made car that closely resembles a well-known foreign model. The remaining space constitutes the private office.

When the Terminal Auto Co. arrived in person and the Motor World man made known his "desire" to purchase a medium-priced car on the instalment plan, the negotiations commenced. Stevenson appeared to be suffering from Philadelphia nervousness, but between pencil taps, finger-drumming and picking at his trousers leg seam he managed to tell the prospective purchaser that he could supply "any car that is made" on payment of 20 per cent. cash down and the balance at the rate of 10 per cent. per month. He would guarantee to produce the car within two weeks after the first instalment was paid. Usually, he said, he could get a car within two or three days, but he always specified two weeks, as he didn't want customers to be dissatisfied. He inquired the make of car the Motor World

man preferred. Being told that a Maxwell or Overland would do, Stevenson delved into the recesses of a desk drawer and brought out a bunch of catalogs. He found the Maxwell book, but was sorry—so sorry!—that he had lost the Overland catalog. However, the loss didn't matter, as he knew the prices. A Maxwell car listing at \$1,000 could be had by paying \$200 down and \$100 per month for eight months. The possession of an Overland would entail \$210 down and the remaining \$840 in eight monthly instalments.

In view of the fact that immediate deliveries of most cars are difficult to secure, the Motor World man wanted assurance that he could get his car within two weeks. He also wanted to know what kind of security he would have to give.

"You do not have to give any security," replied Stevenson. "All I require is the names of two persons who know you."

Purchasing an automobile at such easy terms and without giving security to bind the payments seemed to present such possibilities that the seeker for knowledge wondered how it could be done. He was told.

"You see," explained the Terminal Auto Co., "the car isn't yours until the last payment is made. In the meantime you are operating it under a lease. I am not afraid, as I am fully protected. Each car put out by me is insured against fire, accident or theft. If you run away with it the company will get after you for larceny, and if anything else happens to it I am fully protected. I buy my cars for cash direct from the manufacturers and take the risk of getting my money."

"Will I give a demonstration? Of course, but I haven't got the cars here just now. I am going to have this entire floor pretty soon and then will have all makes of cars on display. But I'll tell you what to do. You can go up to the Overland and Maxwell places and they will give you a demonstration. Don't tell them you are going to buy a car of me, but say that you are in the market for a car. Don't pay any deposit, because they will expect you to buy a car from them. It isn't necessary, anyhow, as they'll be glad to give you a demonstration. And, by the way, bring me back an Overland catalog."

The Motor World man had a friend—a college student—who might wish to purchase a car at the same terms, but he wanted a much more expensive machine, if it could be secured.

"Any make of car manufactured you can get on those terms—20 per cent. down and 10 per cent. per month," asserted Mr. Stevenson. "What kind of car does your friend prefer?"

He was told that the friend had tried to get a Pierce-Arrow and a Locomobile, but he couldn't get a delivery, because he was informed that the output for the year already was sold.

"Don't you believe it," said Stevenson. "That's what they all say. It sounds good in the papers. Say, looky' here. What the h— are their factories running for if they have sold all their cars?"

It being suggested that perhaps they were working on orders long in hand, or maybe on next year's product, the instalment man's sharp features assumed the expression of a frown, and he grunted:

"Oh, fiddlesticks! I'll guarantee to get you any car made inside of two weeks."

The Motor World man then left, ostensibly to get a demonstration of the Overland and Maxwell cars, but promised to return in the morning with the initial payment for which car he selected. At the Overland and Maxwell establishments they laughed at Stevenson's pretensions, and hoped he would show them how to get more of their own cars, which are badly needed for full cash purchasers.

Doubtless the other metropolitan agents and branch houses that are crying for cars and which yet cannot afford to sell on the instalment plan, will be interested and will learn something from the young man who can get any car he wants whenever he wants it and sell it on easy payments without even requiring security for it. The undertaking cannot well fail to prove uncommonly instructive.

### Automobile Mail Service for Nashville.

Following closely upon the heels of the report that Los Angeles, Cal., had decided to install motor cars for collection of mails comes the news that Nashville, Tenn., is to have a complete automobile mail-collecting service. Postmaster Wills has forwarded to Washington recommendations to that effect, in consequence of a highly satisfactory series of tests with motor cars. He found that by the use of the automobiles for the collection of rural mails, delivery was advanced twenty-four hours.

### Garage "Converted" into Church House.

While a number of churches and parish houses have been converted into garages, a turning of the tables has been recorded. The first instance of the kind occurred, curiously enough, in New York City, where the big garage at Madison avenue, between 74th and 73d street, is being made over into a parish house for the Madison Avenue Presbyterian Church. The work will cost when finished about \$8,000.

### Double Control for "Road Lessons."

As a medium of instructing pupils in "road driving," one of the big New York automobile schools has installed a special car fitted with a double control, so that two persons simultaneously can have control of brakes, clutch, and gasoline pedal. This arrangement is particularly valuable in emergencies when it would be too late for the instructor to reach over and catch hold of the ordinary levers.

## JUNK MAN WHO WAS "UP TO SNUFF"

**Sold Parts and Even Built Engine from Factory Scrap—Then Traded on Manufacturers' Repute.**

Building motors out of parts discarded by the inspection department of a well known automobile manufacturer and afterward offering them for sale under the maker's name was the audacious yet simple project disclosed by an investigation undertaken by the manufacturer upon learning that a motor bearing his name plate was being vended by a man in no wise connected with his organization. The resulting discovery that the junk man who handled the waste material from the plant was disposing of certain parts outside the regular market for scrap, caused an order to go forth providing that all parts be broken up before being thrown out. Incidentally, the discovery reveals a possible method of activity hitherto unnoticed and one which manufacturers in general will make haste to suppress if detected in connection with their own operations.

The enterprise, which in the case in point took shape in Buffalo, N. Y., and resulted in an offer to sell a Pierce-Arrow motor reclaimed from the scrap heap, was made possible by the close methods of inspection which prevail in the construction of the Pierce-Arrow Motor Car Co.'s products. Parts which varied only by a few thousandths from the required standards which were discarded from time to time and frequently for no other reason than that they happened to be a very little over or under size, ultimately found their way into the hands of the enterprising counterfeiter, who with the expenditure of only a relatively small amount of machine work and labor thus was enabled to produce a very good imitation of the genuine article, which he promptly labeled "Pierce-Arrow."

Needless to add, means were taken speedily to prevent further efforts along the same line, and arrangements made to break up all discarded components, as already indicated, in order to render them useless for all purposes save that of raw material. The Buffalo enterprise is a natural growth of close inspection methods and the policy which many of the larger and more successful automobile manufacturers have inaugurated of throwing out all materials, manufactured or otherwise, which fail to come up to specifications.

### How to Oil Chains While Driving.

Where double chain drive is employed on cars which are called upon to make long runs under unfavorable road conditions, it is a good scheme to provide a method of oiling the chains at frequent and regular intervals. Where the oil-tight chain case is

used, of course this is automatically provided for. Otherwise it readily is possible to contrive an arrangement for the purpose by mounting a couple of small funnels, one over either of the driving sprockets and at such height as easily to be reached from the driver's seat. From the funnels copper tubes can be led to points directly over the chains. By this means it is possible to reduce the friction of the chains and, if employed in connection with frequent and thorough cleaning of the links and sprockets, the method should work no harm to the transmission.

### 3-In-One as a Magneto Lubricant.

That remarkable lubricant, 3-in-One oil, which already had been applied to a wide variety of uses, now has been found equally useful for the bearings of magnetos. Even before its makers, the 3-in-One Oil Co., 42 Broadway, New York City, had decided to place it on the market for this specific purpose, it had been tried and found satisfactory and its use recommended by one of the most prominent makers of high grade cars, and now its use as a magneto lubricant is to be aggressively pushed. 3-in-One is a clear oil compound free from acid and that does not dry out or gum nor tend to collect dust like mineral oils. The 3-in-One Oil Co. always has maintained the policy of trial before purchase, and this is to be carried out in connection with the new application of the oil, which is to say that a liberal sample bottle of the oil, sufficient to enable it to be given a thorough test, will be supplied free of cost to anyone asking for it.

### Trying to Lift Gas Truck's Embargo.

With the growing use of gasoline trucks, efforts have been renewed to induce the New York insurance authorities to reduce the extra fire hazard of 10 per cent. which is imposed upon the owners of piers who permit such trucks on their properties. Since the extra hazard was imposed, some two or three years since, it has served practically to bar gasoline vehicles from the New York waterfront, few of the pier owners being willing to assume the risk and added expense. Relief rests with the New York Fire Insurance Exchange, the manager of which states that the Exchange committee probably will recommend a reduction of 5 per cent., but he appears to have small faith that the Exchange itself will adopt the recommendation.

### Locking Ignition Saves Batteries.

Whatever may be said of the futility of installing locking devices in the ignition circuit as a means of preventing the car from being stolen, there is one important argument in favor of the practice. It prevents meddlers from switching on the batteries and causing them to run down when the machine is left unattended for any length of time.

## GETTING RID OF THE GLOBULES

**One of the Many Efforts to Improve Carburation—Good Results of Breaking Up the Gasolene.**

With implicit confidence in the manufacturer of his car, the motorist long has solaced himself with the conviction that, whatever mystery surrounded the performance of the machine in other respects, the action of the carburetter was one simple of understanding and perfectly understood. True, numerous theories have been advanced about carburetter action, and a bewildering variety of shapes, sizes and patterns have been offered for use. Notwithstanding, the average automobile owner who ever gave the matter a thought, has been certain that air flowing into the mixing chamber to satisfy the partial vacuum created by the movement of the piston in the cylinder, has gasified a thin stream of fuel which is squirting out of the nozzle. The mixed fuel vapor and air thus created is known in automobile language as the "gas," and ordinarily is supposed to be a body of uniform constituency and inflammability, and to respond unvaryingly in quantity and quality to the exact requirement of the motor.

Growing intelligence on the part of the motoring body, coupled with a certain eagerness on the part of those who are inflated with their own ideas on the subject, however, has brought about a marked change in regard to the popular understanding of what the gas really is, as served to the average motor in automobile use. Candor compels the admission that in most cases it is not a gas at all, but plain fresh air, partially impregnated with fuel vapor, but also laden with an unwieldy mass of gasoline in liquid form unaltered, save that it is subdivided into a multitude of very fine particles. That the ideal requirement of a uniform vapor seldom is attained even under the most favorable of conditions largely is a matter of theory, it is true, but theory supported by the best of circumstantial evidence. For example, when running with a rich mixture, it occasionally is possible to catch a few drops of pure, unaltered gasoline on a sheet of paper held near the muffler discharge pipe of an engine. This, of course, shows that, theory aside, a certain small quantity of fuel actually passes through the cylinder, suffers the intense heat of the explosion, and escapes unvaporized, let alone being burned. By more abstruse—and to the layman less convincing—methods it has been shown that in many cases pure gasoline vapor is present in the exhaust of an engine which, seemingly, is running under normal conditions, and performing its expected amount of work. It is possible to show this by means of a chemical analysis of the exhaust.

Little windows let into the sides of the intake manifold at various points also have been used by experimenters to study carburettor phenomena, the result being that under some circumstances, the glass panes in the manifold were covered with a fine spray of liquid fuel which occasionally accumulated in sufficient quantities to trickle down, just as water gathers and runs down the southeast window when a southerly fog-laden wind is blowing.

By these and other methods of investigation and reasoning those who are most familiar with the carburettor problem have arrived at a point where they have embraced the "globular" theory. Philosophical observation of the performance of the ordinary garden hose assists materially in understanding the principal part of the globular theory. Those who have opportunity to study the action of this implement, or whose memory is sufficiently good to permit its operation to be recalled vividly to mind, are aware that after the water has been projected for a relatively short distance it is broken up into a fine spray which is composed of very fine globular particles. Precisely similar is the action which goes on within the ordinary carburettor. The gasolene, lifted from the jet by air pressure on the body of fuel in the float chamber, and urged forward by the frictional contact of the rapidly flowing air in the mixing chamber, follows practically the same law which obtains in the performance of the ordinary hose.

But it must be borne in mind that what is desired is not to spray the fuel, but to vaporize it; since that is the first of the several functions which the carburettor is called upon to perform. Vaporizing gasolene, or any other liquid fuel, is precisely similar to the process of vaporizing water—that is to say, converting it into steam. It requires the application of heat. When heat is applied to any liquid, the first effect is to raise its temperature; after a certain amount of heat has been absorbed, however, the temperature ceases to rise, and the addition of more heat goes to promote the conversion of the liquid into a gas. Pressure also is an important consideration in general, but in the case of the carburettor, it is not taken into account ordinarily since it is reasonably constant.

Converting the fuel into a fine spray and causing it to mingle with the air in a misty state promotes its evaporation, since by subdividing it into a mass of tiny globules it causes a maximum amount of surface to come into contact with the air. And it is important to note that the rate of heat interchange between the air and gasolene depends both upon the difference in temperature between the two substances and also upon the total area of contact through which the interchange may be effected.

Why, then, does it happen that a perfectly good engine will draw in, compress, burn, expand and exhaust a body of gas, carrying

with it a few particles of gasolene which pass through absolutely unscorched, so to speak? The answer must be that it is because (1) either insufficient time is given the mixture to permit the globules to become thoroughly absorbed and the vapor disseminated throughout the air, (2) that the globules are too coarse or, what amounts to the same thing, too closely arranged to permit the air to mingle with them perfectly, or (3) that the difference in temperature between the air and gasolene is not sufficiently great to promote a rapid interchange of heat. Obviously the question largely is one of vaporization, though the imperfect intermingling of the ingredients of the mixture also may have something to do with it.

Various methods of preventing this difficulty have been adopted by different designers. One clings to the idea that the time element is the most important one to consider, and therefore constructs an intake manifold having a very long path for the gas to travel, believing that by this means a better intermingling of the constituents can be accomplished and hence, a more nearly perfect gas developed. Another inventor adopts some ingenious method of promoting the spraying effect of the nozzle, such as providing a baffle surface for it to impinge against upon leaving the orifice, increasing the velocity of the air by reducing the cross-sectional area of the mixing chamber, or even replacing the single nozzle with two or more, with the same end in view. Still a third carburettor maker, certain that the whole difficulty lies in a lack of heat supply in the gas, increases the temperature of the mixing chamber, extends the jacket to cover a large proportion of the manifold, or even provides a jacket close up to the cylinders, in order to ensure an adequate heating effect.

In what has been said will be found no reference to compensation. That is another and no less intricate phase of the carburettor problem, and one which for a time engaged the attention of inventors almost to the exclusion of all else. But continued experiment revealed the fact that the perfectly satisfactory carburettor was not to be achieved by way of the automatic air valve alone, nor by any other of the several methods of compensation which have been proposed and tried out. Just at present the globule practically has eclipsed the compensating device in the eye of the carburettor man, to use a rather extravagant figure of speech.

Not that the need of compensation ever was overrated or its difficulties of accomplishment unduly magnified, but rather that a better compromise has been effected in respect to this obstacle than as yet has been applied in the suppression of the obstructing globule. It is absolutely essential that the mixture of gasolene vapor and air shall be proportioned correctly at all speeds and under all conditions of throttle opening.

Also it is recognized as being by no means an easy matter of accomplishment when the widely varying conditions which have to be subserved in the operation of the ordinary automobile engine are considered. But it is recognized as an even more pressing necessity just now, to secure the absolute and perfect vaporization and intermingling of the constituents, regardless of the degree of success which has been attained in regulating their proportions.

As for the part which the average motorist is permitted to play in this most important and—to the technically minded—interesting part in the development of the motor car power plant, it is for the most part that of the remote and partially mystified looker-on. Some there be who are willing and sufficiently interested to buy one and another new carburettor, thereby openly questioning the judgment of the manufacturer, and try them out after their own peculiar fashion. Nor are such experiments to be discouraged, either on grounds of futility or expense. They contribute in no small measure to the fund of general information and not infrequently breed new and sometimes helpful conclusions. Save in one respect, however, the average motorist in abandoning the exact arrangement provided by the manufacturer is striking out pretty much at random and in the dark.

Experience has proved that one practical method of assisting the work of the ordinary carburettor exists in a device of which the "Homo" is a good type, which in attachment form may be inserted in the intake line of any engine and which in the case of the Homo is a small pinwheel fan, mounted on ball bearings, which is caused to revolve by the flow of gas, and which in its revolution carries a wire mesh. The constant agitation of the gas produced by the spinning of the mesh results in the splitting up of the globules as well as in the diffusion of the heat which is in the air and thus perfects the vaporization and intermingling of the fuel with the air.

In this principle is found a method of improving the carburation of the average car, which may be carried out by the owner himself, and which in practice has been known to develop really astonishing results. As has been pointed out, the action of the ordinary form of jet and mixing device is unsatisfactory for reasons which are not clearly determined, though the inherent difficulty is well understood. By agitating the mixture it is plain to see that the gas within the intake pipe is caused to be thoroughly mixed and also that the globules tend to be split up into finer particles which more readily yield to the vaporizing influence of the air. The very simplicity of the method, coupled with the direct way in which it furnishes a means of combating the globular difficulty should render this class of device a particularly useful acquisition.

## WEIGHT'S RELATION TO UPKEEP

Franklin Man Indicates the Effect It Has  
on Car and Tires—Argues for Air-  
Cooling.

Speaking of the importance of economy in the maintenance of an automobile, George Babcock, of the H. H. Franklin Mfg. Co., of Syracuse, N. Y., in his lecture before the Brooklyn Y. M. C. A. called attention to the rapid increase of use of the motor car by doctors and other professional men, who are compelled to study the cost of upkeep even more than the first cost. He divided the question of economically running a car into two subdivisions—one relating to the cost of operation, the other to that of maintenance, including repairs. Included in the subdivision maintenance he names "investment" as being greatly influenced by the probable maintenance cost. In fact, he stated as a positive fact that the item of investment can seldom be considered when compared to the item of maintenance.

"It is unusual, said Mr. Babcock, "that investment in mechanical equipment which has somewhat high first cost does not turn out in the long run to be the most satisfactory from the standpoint of total cost; therefore, economy if considered in its best form will direct the selection of the machine that will require the least operating expense for a given output and one which will have the longest life. This is especially true now, as the time is past when the owner must change his car from year to year to be in continuous possession of a modern machine."

Turning from the mere general discussion of economy in operation, the speaker then named as one of the most important single factors in economical car operation weight of the body of the car. Besides the injurious effect which overloading the springs has upon the latter, and the discomfort it causes the passengers, the power of the engine is influenced in a very large degree by the weight of the car. Roadbed and wheel friction are increased by the car weight; raising of the car up the grades is purely a matter of car weight and is directly proportional to the latter. A heavy car, therefore, requires a heavier and larger engine; this heavier engine makes a heavier car, and this, in turn, causes more car and roadbed friction. A heavy car is hard to get started quickly. If the power of the engine is applied too quickly, the tires slip; in trying to stop quickly a heavy car will slide for some distance on the tires.

Taking up the matter of cooling the gas engine, the apparatus for which has considerable to do with the weight of the car, Mr. Babcock then proceeded to show his audience why, in his opinion, air-cooling is

more efficient, more economical and more satisfactory than water-cooling, the former, of course, being the chief characteristic of the Franklin car.

"The engine power," he explained, "is developed by the expansion of the gas due to the heat which it generates in burning. This limit of heat is measured by its destructive action on the cylinder lubricating oil. Cylinder oils have now been developed to a very high degree of heat resistance for use in gas engine work. The limiting continuous temperature under which oils will lubricate is 350 degrees. The piston rings and cylinder walls of cast iron and valves of nickel steel—if you will recall the materials of a common stove—are not destroyed at exceedingly high continuous temperatures. The allowance in the design for expansion due to heat can be easily cared for. Lubricating oil is therefore the only other substance in this heated area, and, as this is the least refractory, provision need only be made for its durability.

"It will be noticed that the safe temperature which we have mentioned is considerably above the boiling point of water. If water surrounding a cylinder boiled at the cylinder wall the steam formed would prevent the circulation of colder water in the confined space, and no cooling could occur. In a water cooled engine the temperature at the wall must not, in continuous operation, be raised above 212 degrees; usual practice is 200 degrees. Therefore to secure a higher wall temperature some medium must be used that will not vaporize at less than 400 degrees, or vapor—such as air—must be used.

"If we can then lubricate other wearing parts of the engine satisfactorily and the temperature of the cylinder wall is kept below the burning point of the oil we have no need to fear engine trouble. With the modern positive feed oiler such lubrication can easily be obtained.

"Again, as we have seen, we should maintain, for economy's sake, the highest possible temperature in the cylinder that will allow of reliable operation. Ignition is surer at a high than at low temperatures, and the resulting burning mixture is more rapid. Therefore, the economical temperature will be limited by the safe limit of the oil. Economy in heat means economy in power, and economy in power means a light weight engine and car, and this means economy in maintenance of car and tires.

"Up to this time the automobile gasoline engine has been compared in weight and economy to the steam engine, electric motor or stationary type of gas engine, and the public has been satisfied. This is, however, now changing. The economical operation of gas engines in certain motor vehicles is being compared to the operation of similar installations. This is the only true comparison.

"The particular reason that the Franklin company adopted the method of air-cooling

was that after a considerable amount of experimental work it was found that an engine could be readily cooled by air if sufficient amount of cylinder surface could be exposed and the air changes sufficiently rapid over this surface. Various methods were tried to secure this desirable feature.

"In the 1910 model the entire engine is enclosed by the boot and diaphragm. The suction by the sirocco fan flywheel draws the air through stacks about the cylinders. This passes uniformly over the cylinder walls and flanges and gives absolutely positive and uniform cooling. It is a very easy matter to maintain the cylinder wall temperature by this method as low as 210 degrees, but the design is such as will allow of about 350 degrees."

### Court Rules Taxicabs "Preferred Risks."

By the granting of a double indemnity in a suit to recover the full amount of an accident insurance policy, the Court of Common Pleas, in Philadelphia, has placed the public motor cab in the class of "preferred risks," which is to say that, besides being given full recognition as a public conveyance, the taximeter cab is automatically given the same position in the accident insurance field as railway cars, steamships, trolley cars and elevators. The decision arises out of the purely legal opinion that, from the nature of its mission, the public service motor car becomes a public conveyance in the eyes of the law.

The action in which the opinion was rendered was brought by Annie E. Primrose against the Casualty Co. of America to recover for the death of her husband, Frank J. Primrose, who received fatal injuries in an accident while riding in a taxicab from Essington to Philadelphia. Primrose carried a \$10,000 accident policy in the Casualty Co., which contained a clause providing for double indemnity in the case of an accident to the insured while riding in a public conveyance. The company paid the \$10,000, but contested the claim for double indemnity on the ground that the motor vehicle was not a public conveyance within the meaning of the policy. Such a vehicle, it was asserted, had no regular route on the public streets, no unchanging termini, and while hired out was in the absolute control of the hiring individual.

Judge Kinsey, who first heard the case, directed the jury to award the widow the additional \$10,000 under the policy, and his action was sustained by the per curiam opinion of the court, which in part says:

The Automobile Company of Philadelphia was a common carrier within the ruling of *Lloyd vs. Haugh*, 223 Pa., 148; its conveyances were, therefore, public conveyances within the terms of the policy, and the testimony shows that they were provided for carrying the public as passengers for hire. The deceased husband of the plaintiff was at the time of the accident riding and being carried in one of those conveyances for a stipulated fare or reward. He was being carried as a passenger from one point to another.

## WHAT TO DO IN CASE OF ACCIDENT

### Why Motorists Should Have Knowledge of First Aid—Some of the Commoner Injuries and Treatments.

That accidents will happen in the best of regulated families is an uncontrovertible truth, and the frequent recurrence in the daily papers of that stock phrase "died before medical attention could be summoned" drives home the force of the argument, that every person should acquaint himself with the rudimentary essentials of first aid to the injured.

Particularly is this true with automobilists, for although the record of automobile accidents is less than is occasioned in other ways, as proved by statistics, it follows that the motorist has greater reason for such knowledge than other persons, for the very simple reason that because of the character of the vehicle, when accidents do occur they generally happen in remote places where it is not always possible to secure prompt medical assistance.

A knowledge of first aid to the injured also is useful for the automobilist because he may at any time be called upon to play the role of good samaritan. In many cases where a person is bowled over by a street car, or injured in some other manner, it is a passing automobile that is requisitioned as an ambulance or to bring a doctor. The value of knowing what to do at the right time in such instances is apparent.

#### Shock.

One of the first things for a beginner in first aid to learn is the prime importance of recognizing and treating shock. The definition of shock is a depression of the nervous system, and may be slight or profound, according to the constitution of the person and the extent of the injury received. In slight injuries the symptoms may be hardly apparent, while a form that would very well illustrate a severe case of shock would be that following a serious railroad injury, and which could hardly be mistaken. There is no other condition which so closely resembles death. It is very necessary that shock, or collapse, be given immediate attention, for if there is no reaction within a certain time (about an hour) the patient will succumb to heart failure. If the constitution of a person be quite sensitive, however, a fright may be sufficient cause to produce shock.

The symptoms which would denote that shock is present are as follows: There is apathy, partial or complete unconsciousness. The breathing is feeble, the face is pinched and anxious looking; the eyelids are in a drooping position; the eyes are lustreless, sunken deeply and turned upward, the pupils generally being dilated. The pulse may

be absent at the wrist, or, if noticeable, is rapid, irregular and weak. The skin is cold and pale; the surface of the body is covered with a cold perspiration, the forehead being covered with large beads of sweat. The skin is sometimes so cold that the person shivers. The mind may wander, and the fingers and nails may be of a bluish color. While articulation is difficult, there is no paralysis present. The sensibility to pain may be so blunted that an operation can be performed without the patient suffering.

When reaction sets in the color and warmth slowly return, the eyes become brighter and the mind clearer; the pulse becomes stronger, and the patient seems more interested in the surroundings. Vomiting is regarded as a favorable symptom, and is usually a sign that reaction has commenced. Reaction does not always insure the safety of the patient, however, as it may be interrupted by hemorrhage or failure of the heart—and death. In cases where there is an injury to the head, the reaction may be so intense as to produce serious cerebral diseases, such as inflammation or congestion of the brain; for this reason the patient should be watched carefully, and the excessive reaction taken care of by applying cold to the head and warmth to the extremities and placing the person in a sitting position.

#### Treatment of Shock.

Loosen the clothing and ascertain whether hemorrhage exists, or whether there is some other symptom present requiring treatment before the attention be turned to the shock. Unless there is something else very necessary to attend to, the shock should receive the first treatment.

If possible, the patient should be conveyed to a place nearby, where the treatment may be better performed. While being removed, the head should be kept as low as, or somewhat lower than, the body, or the extremities may be raised, so as to help the flow of blood to the brain. If possible, four persons should carry the patient, one for each extremity, care being taken not to let the body sag. If one or more bones of the extremities be fractured, a temporary splint may be applied while transportation is being made. After the place selected has been reached, the patient should be carefully stripped of clothing, cutting it away, if necessary, to avoid delay. He then should be placed in a warm bed, his head still being kept low.

The next thing to be done is to apply warmth to the surface of the body, and, if no hemorrhage exists, internal stimulation. The first may be accomplished by applying hot water bottles, bags of hot salt, hot bricks wrapped in paper, etc., to the extremities, under the armpits, between the thighs, and to the pit of the stomach, but not to the head, as the heat may cause congestion when reaction occurs. Dry heat is the es-

sential element. The heat should not be so intense that burns or blisters are caused, for it must be remembered that the person is not in a position to say whether or not the heat is too great. A hot plate enveloped in a cloth may be placed over the region of the heart, and, if unusual vomiting occurs, mustard plasters applied over the stomach. Friction is invaluable in exciting the circulation, and should be resorted to when heat in other forms cannot be applied.

The internal stimulation is governed by the condition of the patient. If able to swallow, he should be given about two teaspoonfuls of whisky or brandy, with a small amount of hot water, or, better still, hot milk; this may be repeated every ten or fifteen minutes, until four or five doses have been taken, or reaction becomes apparent. When the latter occurs, the above stimulation should be lessened or discontinued. Excessive amounts of liquor should not be given, as it might cause undue vomiting and encourage excessive reaction. If several large doses have been given with no effect, it is a sign that the stomach is unable to absorb the liquid; its further administration would be useless. If the person is not able to swallow, the liquor should not be forced down, as this might cause strangulation. In cases where the fluid cannot be given through the mouth, a tablespoonful or more of the liquor in half a cupful of warm milk or water can be introduced into the rectum by a syringe, and may be repeated every fifteen or twenty minutes; also pint injections of water as hot as can be borne by the hand. One half the amount of alcohol diluted as above would be a substitute for the liquors, if the later are not to be had. Beer and ale, containing but two or three per cent of alcohol, would be worse than useless, simply filling up the stomach, with no satisfactory result. A small amount of spirits of ammonia or other, or about four or five drops of nitrite of amyl, on the palm of the hand, or on a handkerchief, and placed under the patient's nose has a decided stimulant effect. Warm turpentine rubbed up and down the spine can be used with benefit, if it does not bother the treatment already begun. Stimulants can also be administered very effectively with the use of the hypodermic needle, but this should not be attempted by the layman. In desperate cases, artificial respiration may be resorted to, but when a patient reaches such a state that this becomes necessary, it is very doubtful whether it will prove of any avail. It does not hurt, however, to try this means, as a person's life is well worth trying to save.

When the reaction has set in (if it is not a fatal case), some form of nutriment may be administered in small quantities, if the patient cares to take it. It must be of a sort that can readily be absorbed, for it would not be wise to call on the strength of a person to digest food, when he needs

all that he has to overcome the effects of the accident. Warm beef tea, or milk, or a sip of kumys, taken occasionally, will be found quite sufficient for the time being.

#### Contusions.

A contusion is an injury inflicted upon a portion of the body by a blow from a blunt instrument, also from a fall, or severe pressure, and resulting in the lacerations of blood-vessels (usually small) and other structures beneath the skin, the latter remaining unbroken.

The subcutaneous escape of blood is immediately followed by swelling and discoloration of the skin; the color being at first black and blue, then green, yellow and so on, until the the extravasated blood is removed by absorption, and the affected part regains its normal color and appearance—usually within two weeks. A black eye is a familiar example of a simple contusion.

In severe contusions, although the skin may at first be unbroken, the soft tissues are often so badly injured, that death of the affected structures (gangrene) follows.

In contusions which extend deeply into the tissues, the discoloration may not appear for a number of days.

When a contusion is followed by very rapid and extensive swelling, in which pulsation can be detected, it indicates that a large artery has been divided.

#### Treatment of Contusions.

Slight contusions need no special consideration. In those of a more severe nature the treatment depends upon the time that elapsed since the injury, and its gravity. If seen early, the indications for treatment are: (1) To prevent the further escape of blood in the tissues; (2) to counteract the pain, shock, or inflammatory action that may follow; (3) to preserve the vitality of the part which may be endangered in severe contusions; (4) to promote the absorption of the blood which has already escaped. Number one can be met by the use of hot (not warm) or cold applications, the latter proving more effective—particularly if used in the form of ice broken into small pieces and placed in a rubber bag made for this purpose, or in a bladder or towel, and applied to the part and retained only until hemorrhage is controlled. Although ice is valuable in checking the extravasation of blood, it should be used with care and not in all cases. In slight contusions, however, where the vitality of the affected tissue is impaired, the use of ice, by still reducing the vitality, may cause gangrene of the parts. Compresses soaked in dilute alcoholic solutions of whiskey, brandy, cologne, arnica, camphor, etc., or solutions containing acetate of lead (sugar of lead), carbolic acid, alum, vinegar, lemon-juice, or common salt, are also very efficacious. Elevation of the part affected diminishes the tendency to the further escape of blood. If shock accompanies the con-

tusion, it is to be treated according to directions given in a previous chapter.

In severe contusions, where the vitality of the part is greatly impaired by the obstruction to the circulation due to the escape of blood into the tissues and consequent swelling, the temperature of the part is lowered, and cold should not be used. The local application of warmth is then indicated, and should be applied in the dry form, as bottles filled with hot water, a bag with bran or oatmeal which has been heated, or whatever form of dry heat can be easily and quickly obtained, will answer. The part should also be surrounded by woolen cloths or any fabric that will serve to retain heat, and if a limb is the part affected, it should be slightly elevated.

#### Wounds.

A wound is an injury of the outer tissues in any part of the body, associated with more or less division of the skin and deeper soft structures, and produced by some mechanical agent.

An incised wound is one made by a sharp instrument, as a knife, or piece of glass. The edges of the wound, when brought together, fit accurately, and completely close the opening.

Hemorrhage constitutes one of the principal dangers of this form of injury.

Lacerated wounds are made by stones, falling against sharp metal edges, etc., and produce more or less destruction of the tissues about the wound, the edges being torn and ragged.

Punctured wounds are inflicted by instruments which are sharp and narrow-pointed, such as a bayonet, a broken spoke, a long splinter, which might have been torn from a fence that was smashed by a driver going through it, etc. Although the openings are quite small, the wounds usually penetrate to a considerable depth, and may injure important blood-vessels and vital organs.

A contused wound is one in which the division of the soft structures is associated with contusion at the point of injury.

Healing of wounds.—Although the healing of wounds is divided into a number of different classes by surgeons, it will be sufficient for us to recognize but two of them—union by first intention, and union by second intention, or granulation.

Union by first intention usually occurs when the edges of the wound fit together nicely, and are not displaced by hemorrhage or improper dressing; when foreign bodies are removed and the wound properly cleaned, and the injured part kept quiet. It is always desirable to obtain this result, which, besides other advantages, prevents disfiguring scars.

Wounds associated with considerable destruction of the tissue, as in lacerated wounds, heal by second intention, or granulation. The first step of nature is to remove the destroyed and useless tissue about the wound by the process known as sup-

uration, or "maturation," and sloughing. After the wound has been thus cleaned, granulation becomes apparent; little conical shoots about the size of a pinhead, and pinkish in color, are found filling up the cavity of the wound. These little bodies are very vascular, and when excessive in size, and too rapid in growth, they rise above the surrounding part, and are commonly known as "proud flesh." After granulation has entirely filled the wound, the upper surface becomes smooth, shining and red, which appearance is the result of what is known as cicatrization, and is called a scar or cicatrix. The scar gradually becomes even whiter than the normal skin, and undergoes more or less contraction. The glands of the destroyed skin are not reproduced in the scar, consequently hair does not grow from the new formation.

#### Treatment of Wounds.

The treatment of a wound consists of the following indications: Arrest of hemorrhage; examination of the wound and removal of all foreign matter; support and protection of the injured part; and rest. The variety of hemorrhage should be determined, whether arterial, venous, or capillary, and arrested in the way described in the chapter on that subject.

A careful search should be made for foreign bodies, which, if allowed to remain, would interfere with the proper healing of the part. Pieces of clothing, splinters, etc., should be picked out with clean fingers or forceps, and the wound then cleaned with a disinfecting solution, or, if this cannot be obtained, pure water, or, better still, water that has been boiled.

If the wound be one of the incised class, the edges may be brought together closely and accurately, and retained in this position by applying over the wound a compress made of antiseptic gauze, preferably, then holding the parts together by strips of adhesive tape. This is a temporary dressing for the proper closing of the wound by sutures or stitches, which holds the edges closely together and favors accurate union. The strips of plaster should not entirely surround the limb, as this would interfere with the circulation. They should be applied with spaces between them, so as to allow any pus which may form to have a free exit. The proper way to apply adhesive tape is to place a strip on one side of the wound, bring the edges together, and then fasten the other end of the plaster on the opposite side of the wound. It should not be placed over the cut all at one time, as this would not allow the proper closing of the wound. In removing adhesive plaster, both ends should be loosened at the same time and carried from the wound, thereby preventing the separation of its edges, which interferes with the healing process.

Great care should be taken that the compresses which support the wound are made of some clean, soft material, such as linen,

THE NEW  
**Rambler**

New Rambler Fifty-Four Toy Tonneau without  
Spare Wheel and Wind Shield, \$2250.

*Rambler workman  
listening to inter-  
meshing of gears  
being tested for silence.*

Rambler gears are so cut and finished as to be noiseless. While other makers consider that only one finishing cut is necessary for a bevel gear, the Rambler method is to make two cuts. All gears are tested for noise before being assembled. Only those which run with absolute silence pass inspection.

# Thomas B. Jeffery & Company

Main Office and Factory: Kenosha, Wisconsin

Branches: Chicago, Milwaukee, Boston, Cleveland, San Francisco

muslin, lint, flannel, absorbent cotton, or, best of all, antiseptic gauze, which can be bought at any drug store.

The compress should be held in place by a bandage, which also helps to keep the edges of the wound together and prevents hemorrhage. Dressings should be undisturbed until healing takes place, unless they become offensive, or constitutional symptoms occur.

Lacerated wounds, which are associated with more or less destruction of the tissue, heal by granulation. Efforts should not be made to bring the edges closely together, or in direct opposition, as this might interfere with the proper escape of discharges; otherwise the same dressings should be applied as in incised wounds. Owing to the very vascular condition of the face and scalp, lacerated wounds of these parts, if not too severe, heal by primary union, or first intention, and should be treated as incised, until some evidence of suppuration or sloughing appears.

If a punctured wound is caused by a long splinter, the latter should be removed if possible, but not if it is liable to cause further injury. If the main portion of the splinter is removed, and there remained smaller pieces at the bottom of the wound, no attempt to remove should be made unless they come out without injuring the surrounding tissue. In a case of this sort the skill of a surgeon should be called upon.

Wounds of the abdominal walls are very dangerous, particularly so if the injury extends to the abdominal cavity, the external opening being large enough to allow of the escape of the bowels or intestines. If this occurs, the mass should be covered with clean cloths, wrung out in warm or hot water, for protection, until the arrival of the surgeon. Over this application should be placed other material, which tends to retain the warmth and offer general support. A wound of the abdominal walls which does not enter the cavity, although dangerous, should be treated as an ordinary wound. The shock which accompanies wounds of this nature must receive the proper care.

Wounds of the thorax or chest are often associated with injury to the lungs. Should this complication exist, it can be recognized by pain and irritation, coughing, difficult breathing, spitting of blood, and the appearance of blood and mucus, and sometimes air at the external opening.

When this condition is present, the external opening should be closed and a compress and bandage firmly applied, and the patient placed in a recumbent position. Should great distress follow, the dressing should be removed and the patient turned over on the side corresponding to the wound, thus favoring the escape of accumulated blood in the chest, which was the probable cause of the oppression. Rest is absolutely essential to the proper healing of wounds, and should be insisted upon, particularly if the injury is of a serious nature.

## THE GIBNEYS "INVADE" NEW YORK

**Philadelphians Reverse the Usual Order of Things—Their Splendid Growth from an Humble Beginning.**

It is not often that Philadelphians invade and set up their stands in New York City, but the Gibneys—James L. Gibney & Bro.—have done that very thing. Having

GIBNEY BROS. NEW YORK STORE

grown from a small bicycle tire repairing firm in 1898 into a big automobile supply house in 1910, the progressive brothers have taken the next step and established a branch

GIBNEY BROS. PHILADELPHIA STORE

house in New York. It is located at 248-252 West 54th street, adjacent to Broadway, and in the big new building which just has been erected at that address.

The store will carry a large stock of tires

and accessories generally; that the Gibney specialties—the Auto Eleck-Trick vulcanizer and the Gibney wireless and sidewire solid tires—will be prominently featured goes without saying; in fact, the Messrs. Gibney say that the demand for these goods largely was instrumental in inducing them to open the New York branch, in which a complete applying and repairing shop will be included. The New York store, incidentally, will be managed by Walter A. Schott, and it is promised that it will be governed by the same fair dealing policies that built up the Gibney business from such an humble beginning.

The extent and expansion of the business is further attested by the growth of the traveling staff. In 1901 it consisted of one man; today ten travelers are employed, who cover the entire country east of the Mississippi river. The man attached to the new York house will travel New England and the territory adjacent to New York City, while the remainder of the country will be handled from Philadelphia as heretofore.

### When Thick Grease Helps Engines.

When, through neglect of the precaution to keep the cylinders clean by frequent injections of kerosene oil, the motor reaches a state where starting is rendered well-nigh impossible through the failure of the piston rings to expand in their slots, temporary relief may be found by the somewhat drastic expedient of forcing small quantities of very thick lubricating oil into the cylinders. After a few turns of the crank this becomes distributed over the cylinder walls so thoroughly as to form a very good packing for the pistons and to afford a reasonably strong suction—strong enough in most instances to enable the motor to induct and partially compress two or three charges per cylinder. Thereafter, of course, the increasing heat in the cylinders tends to "thaw" out the old lubricant which interferes with the action of the rings, thus permitting them to take up their normal work in the regular way.

### Vacuum Cleaning for: Varnish Room.

One of the more modern developments applied in connection with the finishing of automobiles is the vacuum cleaning system. Carriage and automobile painters long have had to deal with an exceedingly difficult problem in maintaining the varnish room free from dust. A good job depends almost entirely upon having the room in which it is done clean and held at an equable temperature. With the adoption of the vacuum cleaner, it now is made possible to clean the varnish rooms frequently without raising any dust and to do so without the necessity of sprinkling the floors, as formerly was necessary in order to lay the dust. The result is that it is easier to keep the air dry and at the right temperature so that better work can be done and drying more rapidly accomplished.

## RECENT PATENTS.

952,433. Variable Transmission Mechanism for Motor Vehicles. Leon M. J. C. Levasseur, Puteaux, France, assignor to La Societe "Antoinette," Puteaux, France. Filed Dec. 11, 1906. Serial No. 347,305.

1. In a motor-propelled vehicle, a device for throwing into and out of gear and for changing speed, a driving shaft, a driven shaft for propelling the vehicle, a casing having a guide in a side wall thereof and secured to one of said shafts, a core within the casing and secured to the other shaft, said core having radial slots, blades movably fitting said slots and having parts engaging the guide aforesaid of the casing, a gate within the casing and between it and the core, a steering device for the vehicle, and connections from said steering device for opening and closing the gate to the extent desired.

952,529. Change of Speed Device. Thomas J. Kehoe, Dayton, Ohio. Filed Jan. 4, 1909. Serial No. 470,649.

1. In a change of speed device, a main driving shaft, a driven shaft, means for forming a direct driving connection between said shafts, a pinion on said driving shaft, a pinion on said driving shaft, a gear connected to said driven shaft, and an intermediate reversing pinion arranged between said driving shaft pinion and said gear, a pair of slow speed pinions also arranged between said driving shaft pinion and said gear, and means for alternately establishing a driving connection between said driving pinion and gear through the medium of said reverse and slow speed pinions, substantially as specified.

952,535. Combined Friction and Positive Clutch. Allen Loomis, Detroit, Mich., assignor, by mesne assignments, to Packard Motor Car Co., Detroit, Mich., a corporation of Michigan. Filed Nov. 10, 1906. Serial No. 342,885.

1. In a clutch mechanism, the combination with a driving shaft, a clutch casing connected with said shaft, and primary clutch disks connecting with said casing, a clutch disk hub mounted with freedom to turn on said shaft within the casing, the secondary disks mounted on said hub, the clutch ring arranged to slide on and turn with said hub and adapted to bear on the clutch disks, a positive clutch member on said clutch ring, and a positive clutch member on said driven shaft and adapted to engage with the clutch member on the ring, for the purpose set forth.

952,575. Convertible Automobile Body. Ransom E. Olds, Lansing, Mich., assignor to Reo Motor Car Co., Lansing, Mich., a corporation of Michigan. Filed Dec. 4, 1905. Serial No. 290,077.

The combination with a vehicle body having a permanent seat and an integral sill portion extending in rear thereof, of a supplementary body portion forming a closed permanent deck upon the sill portion and comprising an end, sides and a rearwardly sloping top, said deck formed with a hinged seat section comprising an intermediate portion of the top and portions of the sides adjacent to the ends of the intermediate portion and rigidly attached thereto, and a supporting rail for the seat section upon the rear of the deck, said rail having spherical enlargements and the seat section pro-

vided with cup-shaped bearings adapted to register therewith when the seat is folded rearwardly.

952,706. Internal Combustion Engine. Ralph Lucas, Blackheath, England, assignor to "Valveless" Limited, London, England. Filed Jan. 28, 1909. Serial No. 474,792.

1. The combination of two cylinders placed side by side, a combustion chamber open to one end of both cylinders, a crank chamber open to the other end of both cylinders, means for supplying air to the crank chamber, a plurality of passages connecting the crank and combustion chambers, means for supplying fuel to one of the passages, and a valve adapted to close the other passages while the latter passage is left open.

952,799. Device for Supplying Compressed Air. Louis Galli, New York, N. Y. Filed April 24, 1907. Serial No. 369,926.

1. An engine comprising a plurality of cylinders; a piston in each of said cylinders; gas inlet and exhaust valves for each cylinder; means for rendering the valves of one cylinder inoperative, said means comprising lift rods; studs rotatable and adjustable upon said lift rods, and adapted to engage the stems of said valves, an air inlet and outlet attachment for said cylinder, removably mounted therein, said attachment comprising an inlet valve operating under atmospheric pressure to admit air to the cylinder; and a valved outlet to said attachment operating to permit the egress of air from the cylinder; and a throttle intermediate said valves and the cylinder for

## The Standard by Which to Judge the Value of Any Car

With so many cars to choose from, each of which is claimed by its maker to represent greatest value, it is small wonder that many people are led to make a wrong choice.

Before you allow yourself to be confused by various agents who talk long and volubly of the advantages of different styles of transmission, carbureters, splash and force feed, oiling system, etc., make it a point to know one car of established reputation.

Choose the Haynes, because it is the only car of established reputation selling at a moderate price.

It gives you a standard by which to judge both the highest priced cars and those of moderate cost.

Get to know this

## Haynes Model 19 \$2000 Fully Equipped

Then see if you can find any car that sells under \$3,000 that has anything in it or on it you can not get in this Haynes for \$1,000 less. Compare its construction, appearance, performance, reputation with any car of similar price and see if you can find one that approaches it in value.

When you make the Haynes your standard you are on the right road to a permanently satisfactory purchase at the lowest possible price.

Start your investigation to-day. Write for descriptive booklet and we will tell you where and when you may secure a demonstration.

interrupting the communication between the valves and cylinder.

952,800. Starting Device for Motor Vehicles. Alphonse E. Garnier, Paris, France. Filed Dec. 7, 1909. Serial No. 531,842.

1. Starting device for motor vehicles comprising in combination a disk keyed on the engine shaft, pins fixed on said disk according to a circle, a lever pivoted on the body of the vehicle, a depending arm pivoted on said lever and adapted to come in engagement with the pins of the disk and a spring acting upon said lever, substantially as described and for the purpose set forth.

953,157. Jack for Automobiles. Edwin I. Spencer, Wichita, Kan. Filed Aug. 2, 1909. Serial No. 510,829.

A jack adapted to pass over the end of an axle close to the wheel thereof consisting of a head, a telescoping supporting member pivoted to and depending from each end of the head, the said members being provided with rigid feet at their lower ends projecting laterally beyond the sides of the said members, a brace pivoted to one of said members and adjustably secured to the

other member, a lifting screw threaded in the head and extending through the same, a hook swiveled on the lower end of said screw, and wheel engaging means suspended on said hook.

953,299. Cooling Device for Pneumatic Tires. Edward J. Schneider, Niagara Falls, N. Y. Filed June 12, 1909. Serial No. 501,822.

1. The combination with the inner tube of a pneumatic tire of a hollow metal cooling chamber mounted on the outside of the spokes of the wheel and having portions of such cooling chamber extending between the spokes, and connections between the chamber and tire.

953,308. Power Transmitting Mechanism. Harry C. Waite, Milwaukee, Wis., assignor of one-half to Samuel W. Watkins, Milwaukee, Wis. Filed Sept. 1, 1909. Serial No. 515,580.

1. As an article of manufacture, a friction gear driving member provided with a driving face, the portion near the center of which has a greater coefficient of friction than the portion removed from the center.

953,332. Search Light Controller. Frank

E. Harris, Lowell, Mass. Filed March 6, 1909. Serial No. 481,733.

1. A shade for automobile searchlights, which comprises a series of curved sections of different sizes which nest one within the other and are pivoted at the same points, and spring connections between them whereby they may be raised successively.

953,427. Sprocket Chain. Frank L. Morse, Ithaca, N. Y., assignor to Morse Chain Co., Ithaca, N. Y., a corporation of New York. Filed June 27, 1908. Serial No. 440,732.

1. An open link chain having links composed of side plates, and pintles formed in two parts, both of said parts extending through the side plates of the two adjacent links at each joint and bearing upon each other throughout the full outside width of the links of the chain.

953,428. Sprocket Chain. Frank L. Morse, Ithaca, N. Y., assignor to Morse Chain Co., Ithaca, N. Y., a corporation of New York. Filed June 27, 1908. Serial No. 440,733.

1. A drive chain having links composed

## FLANDERS FORMS A NEW COMPANY

**A. O. Smith, of Milwaukee, Joins Detroit in New Enterprise—Will Make Automatic Machinery and Parts.**

With Walter E. Flanders, president of the E-M-F. Co., as one of its directors, together with A. O. Smith, the Milwaukee parts maker; Dr. J. B. Book and William T. Barbour, of Detroit, a new company has been formed in Detroit, Mich., for the manufacture of automatic machinery and parts for the automobile trade. It will be known as the Grant & Wood Mfg. Co., and has been incorporated with \$1,000,000 capital.

The company has bought the Grant Automatic Machine Co., of Cleveland, O., and is moving the latter's machinery and equipment to the plant of the Chelsea Stove Works in Detroit, the Chelsea plant having been acquired by the new company. Additional land adjoining the stove works has been purchased and new buildings will be put up immediately. John J. Grant will be the consulting engineer for the concern, and he will bring with him a long experience in the designing of automatic machinery. The officers are: Eben B. Boye, of Cleveland, president and sales manager; A. O. Smith, vice-president; Harry L. Stanton, treasurer and secretary. The board of directors consists of Dr. J. B. Book, John T. Shaw, William T. Barbour, Walter E. Flanders, E. B. Boye, A. O. Smith and Robert M. Brownson.

### Seward to Supervise Kelly-Racine.

William Seward, Jr., who has been representing the Federal Rubber Co. in Chicago, Ill., and who in previous connection with the Hartford Rubber Works Co. and the Michelin Tire Co. has had a wide experience both in the production and the selling end of the tire business, has resigned his connection with the Federal company to become factory manager of the Kelly-Racine

Rubber Co., of Racine, Wis., recently organized by C. F. U. Kelly. The plant now being built on land adjoining that of the Mitchell-Lewis Motor Co. will be equipped under Seward's direction.

### Wood to Make Car of Vaughn Design.

Having developed a new car under the direction of Guy Vaughn at the factory of the New Departure Mfg. Co., at Bristol, Conn., the W. A. Wood Automobile Mfg. Co., of Kingston, N. Y., has been incorporated under New York laws, with \$3,000,000 capital, of which \$1,000,000 is 7 per cent, cumulative preferred and the balance common stock. The directors include William A. Wood, F. E. Moscovics, Charles W. Kahierth, E. C. Dekay, Francis Fitch, Samuel S. Slater and Henry W. Johns.

### Hildebrand Joins Chalmers Selling Staff.

C. C. Hildebrand has resigned as sales manager of the Stevens-Duryea Co., of Chicopee Falls, Mass., with which company he has been identified for a number of years and where he was regarded almost as a fixture by the trade. He has been made assistant general manager of the Chalmers Motor Co., of Detroit, Mich., and is succeeded at the Stevens-Duryea Co. by A. W. Barber, who has been his assistant.

### Vivax Absorbs the Duro Batteries.

The Vivax Storage Battery Co., of Chicago, Ill., has taken over the Chicago Battery Co., which has been making Duro batteries for automobile ignition and lighting. W. R. Gibbs, president and general manager of the Duro enterprise, has withdrawn and will make his home in the East, while Horace W. Beek, manager of the Vivax company, will direct the combined Vivax and Duro battery forces.

### McNutt Non-Explosive Can Goes Up.

Bankruptcy proceedings have been brought against the McNutt Non-Explosive Mfg. Co., of New York City, which was incorporated in 1908 with \$1,000,000 capital to manufacture a patent non-explosive safety can for garages.

## NO "GENTLEMEN'S AGREEMENT"

**Tire Makers Prove an Alibi and A. L. A. M. Agrees with Their Views—Why Tire Contracts Are Refused.**

Despite the fact that the advance notices of the meeting of the board of managers of the Association of Licensed Manufacturers yesterday (Wednesday) had in some degree suggested that the association was to smoke out a "gentlemen's agreement" or something of the sort among the tire makers, the meeting itself resulted not only in the tire makers being freed from suspicion of rapacious connivance against the automobile manufacturers but brought the latter completely around to the tire makers' view of the necessity for holding off on 1911 tire contracts. In fact, the situation was put in such a light that the tire makers, instead of entering compacts to plunder the motor car producers, would seem to have been protecting the car makers and the motoring public by co-operative means and by not accepting heavy 1911 contracts.

The meeting started in the morning and lasted until late in the day, luncheon being served in the association board room during the session, which was presided over by Colonel Charles Clifton, president of the A. L. A. M. Thirty-six of the eighty-odd firms composing the association were represented.

It developed that while it is true that the tire makers have been refusing 1911 contracts for present delivery, their reasons for doing so are quite different from what has been suspected in some quarters. Benjamin Briscoe, president of the United States Motor Co., presented an array of facts and figures concerning the rubber situation that opened the eyes of some of the members. It was shown that for the tire manufacturers to take heavy 1911 contracts for present or early delivery would mean that they would have to go into the open market for rubber, resulting in the raw ma-

terial not only holding its present extremely high price but in its probably going still higher, whereas in the absence of any heavy buying at present the price of crude rubber may be expected to make substantial declines, resulting in correspondingly lessened prices for tires.

As a result of the deliberations, it was decided that the A. L. A. M. members and the tire makers had best co-operate to avoid the necessity of the latter going into the rubber market in its present delicate state, where any substantial purchases might send prices soaring, with proportionate advances for the finished product. To effect this co-operation, the Association's tire committee, consisting of Albert L. Pope, chairman, with L. H. Kittredge, S. D. Waldon and R. D. Chapin, is to be raised to a membership of seven, the three new members to be appointed by the chairman.

S. M. Butler, chairman of the contest board of the American Automobile Association, attended the meeting in the interests of the contest board. He told the manufacturers of the plans that had been made for races and other competitive events throughout the country. He asked all of the makers who have not complied with the A. A. A. rule requiring them to file sworn to certificates of mechanical description of their stock models, to do so at once, as cars that may be entered in contests by their agents or owners can only be allowed to compete under protest until the certificates are on file in the contest board's office.

Howard E. Coffin, president of the Society of Automobile Engineers, addressed those present on the plans of the society, having in view the standardization and general advancement of motor car building.

#### Single Tube Patent Nearing Its End.

Expiration of the Tillinghast "single tube tire patent," which, in addition to being of wide effect and importance in the bicycle tire field, also covered such types of single tube tires as are used on electric and other automobiles, occurs this month, the patent having run its full 17 years since its issuance to Pardon W. Tillinghast on May 23, 1893. The patent, No. 497,971, was controlled by the Single Tube Automatic & Bicycle Co., which exacted royalties from all the manufacturers of single tube tires and was vigorous in its prosecution of those who refused to pay tribute. Its validity was attacked repeatedly, in a series of cases commencing in 1899, but the patent was sustained in every instance, the last decision being in February, 1910, in a decision against the Continental Rubber Works, of Erie, Pa.

#### Van Winkle Tempting the Georgians.

Atlanta, Ga., which is famous among its Southern sisters for its self-induced optimism and boom spirit, is to have another automobile manufacturing enterprise, for which the citizens are being asked to sub-

scribe. The concern is known as the Primo Motor Co., and has been organized with E. Van Winkle, head of the Van Winkle Gin & Machine Co., as its president; W. O. Fields as secretary, and Edward A. Cerf as treasurer. The board of directors includes the officers and J. F. Askew, Edward M. Pearce, H. S. Miles and H. S. Johnson, Jr. On the ground that "every automobile manufacturing concern is making money," investors are appealed to through the public prints to place their subscriptions for the stock at \$50 per share, being assured that the company's stock "will double in value in the first twelve months of its existence." Offices have been established at Rooms 406-8 Forsyth Building.

#### Changes Among Prominent Tradesmen.

L. A. Van Patten has been appointed publicity manager for the Hudson Motor Car Co., of Detroit, Mich. He formerly was a Chicago newspaperman.

J. H. Wagenhurst has been appointed general manager of the United Rim Co. and probably will make his headquarters at Akron, O. Previously he was connected with the Westinghouse establishment.

W. Owen Thomas, who at one time was the manufacturer of a very original car of his own design, has joined the staff of the Fal Motor Co., of Chicago, Ill. He will act in the capacity of consulting engineer.

Harry B. Tuttle, formerly with the Stoddard-Dayton selling organization, has been made superintendent of agencies for the Willys-Overland Co., of Toledo, O. He will appoint new agents for Overland and Marion cars.

Paul C. Kellogg, formerly New England sales manager for Remington typewriters, has been made sales manager for Alvan T. Fuller, of Boston, Mass. L. W. Conklin continues as general manager for Fuller's extensive automobile sales interests.

John D. Murphy has been appointed advertising manager of the Selden Motor Vehicle Co., of Rochester, N. Y. He formerly was a Boston newspaper man, but latterly has been connected with automobile publicity and advertising agency work.

M. H. Pearson has been appointed manager of the branch in Boston, Mass., which the Remy Electric Co., of Anderson, Ind., has established at 214 Pleasant street, in the Motor Mart. He formerly was in charge of the company's Kansas City branch.

H. B. Harper, former advertising manager of the Ford Motor Co., has been appointed export manager of the company and will have his office at 18 Broadway, New York. He succeeds R. M. Lockwood, who resigned. Harper's place will remain vacant, for a while at least.

Harry Scott, assistant sales manager of the New Departure Mfg. Co., of Bristol, Conn., has been appointed head of the technical and racing department of the Chalmers

Motor Co., of Detroit, Mich., and will assume his new duties on May 15. By reason of Scott's resignation from the New Departure organization, H. W. Jones, formerly with the Electric Vehicle Co. and later with the American Locomotive Co., has been made a general representative for the New Departure sales organization.

#### Port Huron Raises Cash for Cass.

Having had a taste of automobile manufacture through the fact that some of the Detroit factories have drawn upon its facilities for making axles and parts, Port Huron, Mich., now is anxious to have a complete motor car plant of its own. To this end the business men of the city, acting with the chamber of commerce, have subscribed \$16,000 towards the Cass Motor Truck Co., which promises to make Port Huron its home.

#### "Spitfire" Pleases "Spit-fire" People.

So closely is the name "Spit-Fire" identified with A. R. Mosler & Co., of New York City, manufacturers of "Spit-Fire" spark plugs, that the appearance of a play with the title "Spitfire" was made the occasion, last week, for a theater party for the Mosler officers and employees. After seeing the dramatic "Spitfire" the party was given a banquet.

#### Canadian Location for Texas Factory.

A Canadian automobile factory in Texas is the apparent anomaly undertaken by R. E. Parker, a Texas promoter, but the matter is cleared somewhat when it is explained that it is in the Texas town of Canadian that he proposes to build his factory. A number of the leading citizens of the place are said to have.

#### Stoddard-Dayton Not Yet Absorbed.

Doubtless due to the fact that the officials of both companies have been in conference, reports are circulating that the Stoddard-Dayton Motor Car Co. has been taken over by the United States Motor Co. A high official of the latter concern, however, yesterday denied that any deal had been consummated.

#### Made Parts; Will Now Make Cars.

Having made automobile parts for some time, the F. W. Spacke Machine Co., of Indianapolis, Ind., is preparing to go further and make complete cars. An addition to the factory is now being made for this purpose, the product to be a four cylinder touring car.

#### Garage Equipment Builders in Milwaukee.

The Garage Equipment Co., of Milwaukee, Wis., making a number of accessories and specialties for the automobile trade, has commenced the building of a new factory, at 142 South Pierce St. The structure will cost \$30,000, will be 150x100 feet and two stories high.

**STEVENSON'S INSTALMENT SALES**

**He Now Won't Even Insist on 20 Per Cent. Down—Gives References, but They Pan Out Poorly.**

Things are getting easier than ever for those persons who wish to buy new cars of "any make" on the instalment plan, if one is to believe the enterprising Guernsey Stevenson, who is operating in the Hudson Terminal building, New York City, as the Terminal Auto Co., and whose entertaining representations and methods of doing business received some uninvited attention in the Motor World of last week. In addition to selling cars on instalments without security, and requiring no references other than the names of two persons with whom the purchaser may happen to do business, Stevenson is now willing to relax his rule about requiring 20 per cent. of the purchase price down when the order is placed. If he cannot get the purchaser to pay 20 per cent. cash preliminary to waiting for the delivery of his car, Stevenson will take less.

An exposition of his "easy payment" scheme already having been given, no small interest attaches to the fact that up to yesterday (Wednesday) he was still doing business and taking deposits on cars to be delivered some time in the future. His willingness to take less than the 20 per cent. called for by his printed terms was disclosed in the course of a visit by a Motor World man, who, however, was not the same one who called on Stevenson last week, but who also was "seeking knowledge" concerning the enterprise.

"Does one make the first payment when the car is delivered?" the Motor World man asked, after making a preliminary noise like "a live one."

"Certainly not!" exclaimed the blooming cheeked Philadelphian, in haughty briskness. "You pay the money when you place the order, just as you do with any automobile agent, and then wait for the machine to come from the factory."

"But, you see," responded the Motor World man with becoming hesitancy and delicacy, "I don't know who you are and I would not like to pay out money until I knew more about you. Do you give references as to your stability and business standing?"

"Go to any bank and ask about us," the Terminal Auto Co. replied, waving his hand expansively as if to include both Maine and California.

"That seems pretty indefinite," his questioner murmured. "What particular bank would you name?"

"Oh, any bank there"—pointing toward New Jersey—"will tell you we are all right; any bank at all."

Then taking up a copy of the Mount Vernon Argus, a newspaper published in Mount Vernon, N. Y., that was one of the few to print the alluring advertisement which he had dispensed so generously, he said: "Now, there is a newspaper that knows us well. They know all about us and will tell you that we are good."

"Of course," he continued, "if you don't want to, you needn't pay the whole 20 per cent. down. If you pay \$100 or so—just enough to bind the bargain—why, then, we can fix it up for you so that everything will be satisfactory."

Literally following his advice to ask any bank, the Motor World man sought information concerning the Terminal Auto Co. from officials of several of the nearest banks, but it appeared that none of them had ever heard of the concern, let alone testifying to its financial soundness. Inquiry made to the business manager of the Mount Vernon Argus disclosed that the Mount Vernon publishers "know nothing as to his financial standing or as to his ability to carry out his promises," but they do know that although a representative of the paper had called to collect for the first advertisement and had seen the Terminal Auto Co. himself, they had been unable to get the money.

**Shifts in the Royal Tourist Forces.**

Changes have been made in the arrangement of the selling forces of the Royal Tourist Car Co., of Cleveland, O., by which E. D. Shurmer, a former head of the Royal Tourist interests, takes charge of the Western selling territory, with Chicago as a center. A. D. MacLachlin, the former general sales manager of the company, takes a traveling sales managership, and will confine his attentions to the East, making his headquarters in New York City.

**Beaver Dam Offered an Opportunity.**

The Minneapolis Motor & Truck Co., of the Minnesota city of that name, is flirting with Beaver Dam, Wis., for the use of a disused factory building at that place, and also for financial support. The company, which is capitalized at \$500,000, desires that the Beaver Dammers subscribe for from \$30,000 to \$50,000 of its stock to induce it to settle "in their midst."

**Evidence of Columbia Nut Prosperity.**

The Columbia Nut & Bolt Co., of Bridgeport, Conn., is adding another story to its factory, increasing the floor space by about 30 per cent. The machinery equipment for the manufacture of Columbia lock nuts is being doubled.

**More Bodies to be Made in Michigan.**

The Lindner Interior Mfg. Co., of Grand Rapids, Mich., has taken up the manufacture of automobile bodies. It has made preparations for an output of 6,000 bodies per year.

**DEALERS TRYING COUPON BOOK**

**Los Angeles Association Seeks to Lessen Sales on Credit—Coupons Interchangeable and Backed by Cash.**

To stimulate a cash basis for sales of accessories and for repair charges, the Licensed Automobile Dealers' Association, of Los Angeles, Cal., has perfected an interchangeable coupon book system which will afford customers what is practically a 5 per cent. discount for cash and which may be used for the purchase of oil, gasoline, accessories, tires and parts and for paying repair bills. The saving effected by the owner who uses a coupon book is looked to as insuring the employment of the system by a large proportion of the dealers' customers, resulting in lessening the volume of book accounts that many dealers begin to find burdensome.

The interchangeable coupon book, containing \$5, \$10, \$20, \$25 or \$50 worth of coupons, may be purchased from any member of the Licensed Association, and the coupons will be honored not only at the place where they were bought but at the establishments of any of the other dealers belonging to the association. The dealers have deposited a sum of money in a Los Angeles bank equal to the value represented by the coupons, and as more coupon books are needed the dealers will buy them from the bank, receiving cash from the customers as the latter take them. The coupons represent so much cash, but are of more value than cash to the owner, in that when payments are made in coupons a 5 per cent discount is allowed.

Several Los Angeles concerns have tried the coupon system individually, giving commutation on the meal ticket principle, and the plan has met with sufficient success to induce the association to try it as a whole. The fact that the coupons are good at the garages and repair shops of all the members instead of being limited to use at once place, and that they are backed by cash deposits in the bank, gives them an advantage over the ordinary form of commutation. In lessening the bookkeeping and avoiding the losses incident to credit accounts, the dealers expect to make up the 5 per cent.

**Bonnell Becomes a "Licensed" Man.**

Horace A. Bonnell, of Newark, N. J., has been appointed assistant to Alfred Reeves, general manager of the Association of Licensed Automobile Manufacturers, taking the place made vacant by the resignation of Coker F. Clarkson, who is now with the Society of Automobile Engineers. As treasurer of the American Automobile Association and manager of the automobile show in Newark, N. J., Bonnell is well versed in the fiscal side of the trade and sport.

**THE WEEK'S INCORPORATIONS.**

Detroit, Mich.—Wisner Carburetter Co., under Michigan laws with \$6,000 capital.

Smyrna, Del.—Smyrna Automobile Co., under Delaware laws with \$25,000 capital.

Wilmington, Del.—Automobile Union Oil Co., under Delaware laws with \$250,000 capital.

North Stonington, Conn.—North Stonington Garage, Inc., under Connecticut laws; articles of association.

Chicago, Ill.—Whipple Car Co., a Maine corporation with \$2,000,000 capital admitted to do business in Illinois.

Chicago, Ill.—Hartford Suspension Co., a New York corporation with \$100,000 capital admitted to do business in Illinois.

Madison, Wis.—Studebaker Automobile Co., an Indiana corporation with \$100,000 capital admitted to do business in Wisconsin.

Indianapolis, Ind.—Gearless Steering Device Co., an Arizona corporation with \$100,000 capital admitted to do business in Indiana.

Indianapolis, Ind.—German-American Car Co., a West Virginia corporation with \$350,000 capital admitted to do business in Indiana.

Scranton, Pa.—Scranton Taxicab Co., under Pennsylvania laws with \$5,000 capital. Corporators—R. A. Amerman and others.

Philadelphia, Pa.—Philadelphia Motor-drome Association, under New Jersey laws with \$2,000,000 capital; to operate an automobile track.

Fitchburg, Mass.—Bickford Auto Livery Co., under Massachusetts laws with \$5,000 capital; automobile livery. Corporators—O. E. Bickford and others.

Sandusky, O.—Sandusky Auto Parts & Truck Co., under Ohio laws with \$150,000 capital. Corporators—Daniel E. Storms and J. M. Woods, Indianapolis, Ind.

Atlanta, Ga.—Fitzsimmons Motors, Inc., under Georgia laws with \$5,000 capital; general automobile business. Corporators—George Fitzsimmons and others.

Portland, Me.—Automatic Lock, Nut & Bolt Co., under Maine laws with \$1,500,000 capital; locks, nuts, bolts, etc. Corporators—A. G. McPherson, B. Smith.

Atlanta, Ga.—Georgia Motor Car Co., under Georgia laws with \$50,000 capital; to deal in and manufacture automobiles. Corporators—G. W. Hanson and others.

Boston, Mass.—American Rapid Transit Co., under Massachusetts laws with \$200,000 capital; general automobile business. Corporators—G. A. Smith, F. L. Townsend.

Worcester, Mass.—Alsten & Goulding Co., under Massachusetts laws with \$75,000 capital; to manufacture automobile tires. Corporators—J. A. Alsten, H. C. Goulding.

Martinsville, Ind.—Martinsville Auto Co.,

under Indiana laws with \$10,000 capital; general automobile business. Corporators—K. I. and Blanche M. Nutter, W. E. Clark.

Norfolk, Va.—Seaboard Auto & Storage Co., Inc., under Virginia laws with \$20,000 capital; general garage business. Corporators—R. L. Reams, C. B. and E. G. Orrell.

Worcester, Mass.—Worcester Electrical Mfg. Co., under Massachusetts laws with \$30,000 capital; to manufacture electrical devices. Corporators—J. and J. P. McGrady.

Paterson, N. J.—Bonom International Turbine Co., under New Jersey laws with \$100,000 capital; to manufacture steam turbines. Corporators—A. Bonom, A. Brunner, A. Romella.

Meriden, Conn.—Blue Ribbon Garage, Inc., under Connecticut laws with \$50,000 capital. Corporators—Johannes Schiott, William E. Seeley, Sanford Stoddard, all of Bridgeport.

Stockton, N. J.—The Autoplume Co., under New Jersey laws with \$40,000 capital; to deal in patents, etc. Corporators—Theodore S. Moore, John W. Smith, Asa B. Hockenbury.

Jacksonville, Fla.—Florida Motor Co., under Florida laws with \$20,000 capital; general automobile business. Corporators—H. B. Clark, Breward, N. C.; J. A. Forsythe, Jr., Jacksonville.

New York, N. Y.—N. H. Badgley, Inc., under New York laws with \$25,000 capital; to manufacture and deal in rubber tires, rubber goods, etc. Corporators—A. Watson, M. Hotchner, M. Held.

Chicago, Ill.—Farrington-White Co., under Illinois laws with \$10,000 capital; to deal in automobiles and supplies. Corporators—William P. Farrington, Frank B. White, William B. White.

Bronx, N. Y.—Tremont Motor Car Co., under New York laws with \$1,000 capital; general automobile repair and supply business. Corporators—Seymour Mork, Harry Block, Emanuel M. Kaiser.

Camden, N. J.—Sweeney Automobile Co., under New Jersey laws with \$10,000 capital; to manufacture automobiles, motorcycles, etc. Corporators—F. R. Hansell, John A. MacPeak, William F. Eidell.

Detroit, Mich.—Peninsular Gear Works, under Michigan laws with \$60,000 capital; to manufacture automobile parts. Corporators—John B. Meyers, Elmer D. Greenmayer, Fritz Offenauer, all of Newcastle, Ind.

Philadelphia, Pa.—Auto Central Co., under Delaware laws with \$25,000 capital; general automobile business. Corporators—J. G. McPherson, A. W. Southworth, Philadelphia; D. P. Moore, Washington, D. C.

New York, N. Y.—Modern Transmission Mechanism Engine Co., under New York

laws with \$25,000 capital; to manufacture and deal in motors, engines, pumps, etc. Corporators—G. R. Jaeger, F. W. Jaeger, F. Eveland.

New York, N. Y.—Malley Motor Co., under New York laws with \$500 capital; to manufacture and repair motor vehicles, etc. Corporators—Thomas Malley, Brooklyn; W. H. Pumphrey, M. G. Crawford, New York City.

New York, N. Y.—Selnik-Klinger Co., under New York laws with \$5,000 capital; to manufacture and deal in automobiles and parts for same. Corporators—Henry Selnik, Brooklyn; Louis Klinger and John Blumenthal, New York City.

Trenton, N. J.—Coryell Automobile Sign Holder Co., under New Jersey laws with \$10,000 capital; to manufacture automobile number plate holders. Corporators—George H. Poulson, Jedediah G. Coleman, Harry S. Provost, Theodore Backes.

New York, N. Y.—Horseshoe Tire Co., under New York laws with \$25,000 capital; to manufacture and deal in automobiles, supplies and tires. Corporators—W. E. Holloway, W. Huber, New York City; H. D. Foster, Tompkinsville, S. I.

Philadelphia, Pa.—Automobile Owners' Association, under Delaware laws, with \$250,000 capital; to manufacture and deal in automobiles. Corporators—J. C. and F. J. Niles, W. Wilson, Alan Carson and H. J. Kunkle, all of Philadelphia.

New York, N. Y.—Auto Owners & Operators' Protective Association, under New York laws with \$25,000 capital; to manufacture and deal in automobiles, sundries, automobile insurance, etc. Corporators—P. J. McGrath, F. J. Hagen, H. Miller.

Cortland, N. Y.—Cortland Motor Wagon Co., under New York laws with \$100,000 capital; to manufacture and deal in automobiles and accessories. Corporators—L. O. Mecham, Hugh M. Duffey, Cortland; R. H. Jadwin, C. H. Pond, Scranton, Pa.

Binghamton, N. Y.—Chenango Motor Car Sales Co., under New York laws with \$15,000 capital; automobile sales business. Corporators—W. Bruce Roff, Alfred E. Landman, Binghamton; Harry K. Crandall, Vine Crandall, Athens, Pa.; Fred D. Corye, Buffalo.

New York, N. Y.—White Spot Safety Signal Co., under New York laws with \$100,000 capital; to manufacture and deal in automatic signals for automobiles and vehicles of all kinds. Corporators—L. O'Brien, E. E. Davis, Montclair, N. J.; J. T. Bunt, New York City.

**Increases in Capitalization.**

Chicago, Ill.—Long Mfg. Co., from \$100,000 to \$300,000.

York, Pa.—Pullman Motor Car Co., from \$100,000 to \$500,000.

Pittsfield, Mass.—Alden Sampton Mfg. Co., from \$300,000 to \$2,000,000.

## IN THE RETAIL TRADE.

Binghamton, N. Y., has a new automobile concern styled the Chenango Motor Car Sales Co. It will market Speedwell and Overland cars locally.

The White Company's Washington (D. C.) branch at 1124 Connecticut avenue has been discontinued; for the present the local headquarters will be at the Belmont garage.

Washington, D. C., has another exclusive electric automobile agency which has been opened by H. B. Leary, Jr., at 1717 Lamont street, N. W. He has the Bailey agency.

John Thomas, Washington, D. C., who has the Maxwell agency, has taken possession of new salesrooms at 1323 Fourteenth street, N. W. The new quarters afford much better facilities.

The Auto Supply Co., Los Angeles, Cal., has located a branch in San Francisco at 444 Golden Gate avenue. W. E. Van Duzen, treasurer of the company, will be the manager of the new store.

Possession shortly will be taken by the Van Da Grift Auto Co., Louisville, Ky., of a new garage at 7th street and Broadway, which is one of the finest in the city. It will have accommodations for 100 cars.

Adding another to their long chain of branches throughout New England, the Post & Lester Co., Hartford, Conn., have opened a store in Worcester, Mass., at 12-14 Mechanic street. O. A. Jones is in charge of it.

Coincident with its recent removal to 1214 V street, N. W., Washington, D. C., the Overland Garage has undergone a change of name and ownership and now is known as the Imperial Motor Co. E. A. Garlock is the new proprietor.

The Corker Motor Car Co., Atlanta, Ga., has taken possession of the new garage at the corner of James and Fairlie streets, a three story and basement brick structure. The company is agent for the Matheson, Haynes and Waverley electric.

Clyde, Curry & Co., Windsor, Ont., have entered the automobile business and secured the E-M-F. agency for Windsor and Essex counties. Work will be commenced shortly on the erection of a sales and garage building at Ouellette avenue and Park street.

Work soon will be started on a new garage for the C. P. Weeden Motor Co., Trenton, N. J., at 155-57 Brunswick avenue. The company at present is quartered temporarily at 178 Bushwick avenue and represents the Studebaker lines and Randolph trucks.

The Inter-State Motor Co., of Philadelphia, Pa., a newcomer in that city, has established itself at 518 North Broad street, where it will exploit Inter-State and Brush cars. M. Wertheimer, formerly a raincoat manufacturer, is the manager of the concern.

The Johnson-Kellam Motor Sales Co.,

Detroit, Mich., at present located in the Tolsma building, shortly will open new salesrooms at Woodward and Warren avenues. The company has arranged to market the entire output of the Detroit-Dearborn Motor Car Co.

With the opening of their new American garage on Clinton street, opposite the Pennsylvania station, Twist & Driscoll, Trenton, N. J., now have one of the finest establishments in the state. They are agents for the Hupmobile, Mitchell, American and Cole "30" cars.

The Harlan (La.) Garage Co., which is of recent birth, is about ready to take possession of its new garage on Seventh street, north. The plant includes a well equipped repair shop, and Rambler and Auburn cars will be handled. W. M. Lana and W. L. Paup are the proprietors.

The Washington Motor Vehicle Co., of Spokane, Wash., is completing a new garage at 508-10 Second avenue, which will be devoted exclusively to the care of electric vehicles. The building, which will be of modern construction, will be 35x75 and will include a complete charging plant.

F. E. Chambers and Julia Miller, Atlanta, Ga., who operated as the Buckeye Auto Co., have dissolved partnership, and Miss Miller has formed a new company under the title of the Holt-Boone Motor Co., to continue the business. The Ohio car agency for Atlanta and northern Georgia accrues to the new company.

The Segerstrom Automobile Co., Minneapolis, Minn., has leased the two story building at 202 Nicollet avenue, the first floor of which will be devoted exclusively to the sale of Rider-Lewis and Moon cars, for which the company has the agency. The Segerstrom Vulcanizing Co., a subsidiary, will occupy the second floor.

Abandoning the manufacturing for the selling field, W. C. McNabb, Atlanta, Ga., has "dipped into" the accessory business and opened offices in the Candler building, where he will conduct a jobbing business. He formerly was president of the McNabb Iron Works, and designed the Billy car, which is made by that company.

In keeping with its announced intention of operating its own branches, the E-M-F. Co., Detroit, Mich., has absorbed its Boston (Mass.) agency on Boylston street, which was formed by B. N. Crockett and C. A. Malley, when the company severed its relations with the Studebakers. Messrs. Crockett and Malley will remain with the local branch under the new regime.

One of the handsomest showrooms in Philadelphia, Pa., just has been occupied by the Taylor Motor Distributing Co., at 210-12 North Thirteenth street. The new quarters embrace the entire ground floor of a large concrete building and are luxuriously appointed. The company, which was formed recently, has the Matheson

agency and also acts as distributor for the Warren-Detroit cars for six adjacent states.

Plans have been drawn for a new sales and service building for the Ellis Motor Car Co., Newark, N. J., Pierce-Arrow representatives, which is expected to surpass anything of its kind in the state. It will add join the present establishment on Washington street, between New and Linden streets, and will be a four story brick and concrete structure, 50x100, and will represent an outlay of \$50,000. The building is expected to be ready September 1.

Alleging that the other members of the company, Charles A. Dickson and Benjamin C. Fink, acting as directors, voted to dissolve the Pope Auto Co., Newark, N. J., without an accounting, Alfred P. Heidrich, the other partner, has made application to Vice-Chancellor Garrison of Newark for the appointment of a receiver to take charge of the company's affairs. The company, which has been in existence two years, has the Pope-Hartford agency and Heidrich alleges the last year's profits were \$20,000, which are not accounted for. There are no creditors.

Several new and handsome garages now in process of erection in Minneapolis, Minn., will be completed shortly. The MacArthur-Zollars Motor Car Co. has a two story building, 75x136, at Thirteenth street and Nicollet avenue, which will be ready soon. It is built of brick with stone trimmings and has storage room for sixty cars as well as a complete repair shop. The concern handles the Amplex, Everitt, Anhut, Black Crow and Babcock electric lines. On May 15 the White Garage Co. expects to take possession of its new building on Tenth street, between Sixth and Seventh avenues. It is built of red brick, 50x150, two stories and basement and will cost \$30,000. It will be devoted to the sale of White cars and Waverley electrics.

## Bohemia Offers Opportunities.

Although the city of Reichenberg, Austria, and the surrounding country possess a great number of automobiles, and the roads are excellent and well adapted to touring, only one American automobile is owned in that district. Consul Charles B. Harris, stationed in this Bohemian town, reports that a good market exists there for high priced as well as medium priced automobiles, and that the well-to-do people of the neighborhood bought fully 800 automobiles during the past year. "The car desired in the immediate neighborhood of Reichenberg," says the consul, "is that constructed particularly strong for a mountainous country. There are many automobiles in this district, but only one American (a White), so far as known. The American cars can be sold here, if adapted to mountain traveling and their good qualities properly brought to the notice of the buyer."

# White Steam and Gasoline Cars for 1911

Having disposed of our 1910 product, we now announce our steam and gasoline models for 1911.

Full details regarding the new models, dates of delivery, etc., may be obtained on application to any of the offices or agencies of the company.

## THE WHITE COMPANY

Licensed under Selden Patent.

#### Carry the War to the "Horse Trotters."

The "nerve" of the corporal's guard of Brooklyn horsemen who are seeking to make more secure their pre-emption of a mid-section of the main highway to Coney Island is the most admirable thing about them. After the squelching of the "sneak" bill which would have served the horsemen's purpose, that two members of the legislature should father a measure which openly discloses the interests to be served shows the high order of statesmanship that inspires a portion of the New York legislature.

The day for "horse trots" on the public highways is past. That sort of thing constitutes a relic of provincialism. It has been too long endured in Brooklyn and the present is a good time to put a stop to it. The idea of permanently setting aside a public highway or any portion of it for the use of a particular form of sporting activity, whether with horses or automobiles, is ab-

horrent and contrary to the spirit of law and equal and exact justice.

The Coney Island Boulevard should be free for all manner of travel and the automobile interests should not be content merely to oppose the new and restrictive measure introduced at Albany. They should carry the war to the "horse trotters" by having introduced a bill that will not permit such continuous use of a public thoroughfare. It will throw those men on the defensive and serve to give the popular boulevard, and all of it, to the whole people, to whom it belongs.

As there are three horse tracks in the immediate vicinity of that portion of Coney Island Boulevard which the horsemen are seeking to grab, there is not and never was real excuse for permitting their "horse trots" on the highway; and that thousands of road users should be inconvenienced for the sake of the pleasure of ten or fifteen owners of high stepping nags—rarely is even that number in evidence—ought to be, if it is not, unthinkable.

#### Improving the Garage Service.

Perhaps it is not too much to say that the immense importance of the public garage is yet to be thoroughly appreciated. In a way, that is much the same as saying that people never appreciated the advantage of the village "boarding and sales" stables; but in a way it is much different. In the case of the motor vehicle, certain equipment features are required which the ordinary establishment of limited resources cannot acquire; which are beyond the means of the private owner, and which can be maintained only where a not inconsiderable amount of capital and a fairly good run of business are available. The well-established garage thus assumes an institutional importance which the enlarged stable never could pretend to. The present strength of the manufacturing end of the industry is a just cause for pride. But the garage business, taken as a whole, is an even greater enterprise; it involves the maintenance of all the cars at present in existence, as well as the provision for those which constantly are being thrust upon the market in such bewildering numbers.

A serious reflection in this connection is that the garage business always has been supposed to be a none too profitable undertaking. Save in rare instances, garagemen in town and country always insist that repairs, which constitute an important portion

of the garage's function, are more or less of a burden. There are plenty of reasons why this should be the case, and, possibly, a few why it should not. At all events, the complaint generally excites no comment and little sympathy, if any. But when the case of the isolated garageman who is forced to spread out the income from his garage to cover the repair shop is multiplied to the extent of covering the establishments which must care for the 300,000 cars, which it has been claimed are at present in use in this country, it appears that the garage problem is one of considerable gravity.

Like any other business which is built up by the annexation of small and unallied units, the garage undertaking is not subject to the same co-operative growth which the evolution of a producing industry usually results in. It is more like the evolution of the small store—conditions improve as facilities for conducting it, and fixtures, machinery and supplies multiply and cheapen; and the income of the average establishment of its class is governed in large measure by the general prosperity. All the same, the garage business as a whole is amenable to certain influences which automobile manufacturers and private owners alike can bring to bear. Certain abuses are to be discouraged, certain standards of conduct fostered, certain frictional elements such as overcharges, the tipping evil, substitutions of branded supplies and the like, may be adjusted alike by certain subtle methods known to the trade, and by external pressure brought to bear by the motorist himself. The garage problem is one of manifold application, but requiring individual solution. Nevertheless, it presents interesting possibilities for study and exploitation and is destined to continue to do so clear down to the end of the chapter.

#### About Driving on the High Speed.

Unless motorists are carefully instructed in the proper use of the machine, it is possible that the development of the motor which is characterized by high torque at low speed may become a not unmixed blessing. Just at present, with the long stroke proportions in high favor and slow rates of car speed demanded on high gear, this type of engine is very much to the front; or, rather, designers are striving very hard to develop this particular quality in their products. Nor is there any question as to the real merit of the principle in-

volved. The danger is that as a direct result of the general publicity which it receives and the ambitions of the average owner to put his machine through its best paces upon every possible occasion, the long stroke, slow speed engine may be subjected to undue abuse; and that short life in the bearings and high fuel costs may lead the engine itself into disrepute which is wholly undeserved.

As was pointed out a year or two ago, when continuous running on the high gear first became prevalent, it always is unwise and expensive, from the mechanical point of view, to operate the engine under overload conditions merely for the sake of keeping the speed lever in a certain position which happens, for the moment, to be fashionable. And this is about all that high gear running amounts to in many cases. Abuse of the engine under such circumstances causes the connecting rod brasses to wear excessively, develops looseness in the crank shaft bearings and generally tends to rack the car from end to end. Such abuse develops whenever it is attempted to force the car to climb too steep a grade on high gear, to force its way through deep mud on high gear with the engine partially throttled when the transmission is set for the direct drive, or whenever unduly rapid acceleration is attempted on city streets under similar mechanical conditions.

Another point to be considered in the same connection is that of fuel economy—never one to arouse much interest, but a point which, in the aggregate, is of vital importance to the industry and the trade. As may happen when any single feature is given excessive prominence, there is some chance that its development may lead to the neglect of others. Automobile design involves so much of compromise that to make a decided departure in any direction is pretty apt to lead to equivalent compensation in another. This is not the same as saying that the long stroke motor is not economical; merely that if slow speed and a powerful turning moment are made to appear the only desiderata, there is some chance that, among other things, economy may be sacrificed.

Largely the question is one for the operator to consider. Motorists should learn that the advantages of the high gear are as readily subject to abuse as any other advantages which may be available. Several years ago practically every car produced was supposed to be capable of making sixty

## COMING EVENTS

May 13, Denver, Colo.—Automobile races at Overland Park.

May 13-14, New York City—Motor Racing Association's 24 hours race at Brighton Beach track.

May 14, Kansas City, Mo.—Automobile Club of Kansas City's hill-climb on Dodson hill.

May 14, Vicksburg, Miss.—Vicksburg Automobile Association's hill climb on Mackey's hill.

May 18, Cheyenne, Wyo.—Cheyenne Motor Club's race meet on motordrome.

May 18-19, Norristown, Pa.—Norristown Automobile Club's third annual endurance run to Scranton and return.

May 19, Chicago, Ill.—Chicago Motor Club's second annual demountable rim test.

May 19-21, Hartford, Conn.—Automobile Club of Hartford's All-Connecticut reliability contest; 600 miles.

May 22, Fort Worth, Tex.—Fort Worth "Star-Telegram" endurance run.

May 22, Memphis, Tenn.—Automobile races at Tri-State fair grounds.

May 22-23, Brooklyn, N. Y.—Crescent Athletic Club-Long Island Automobile Club amateur touring contest on Long Island for Pardington trophy.

May 25, Columbus, O.—Columbus Automobile Club's reliability run to Indianapolis, Ind.

May 27, 28 and 30, Indianapolis, Ind.—Grand Circuit meeting and national championship races on Motor Speedway.

May 27-31, Washington, D. C.—Washington "Post" five days endurance run to Richmond, Va., and return.

May 28, White Plains, N. Y.—Amateur Automobile Contest Association's hillclimb.

May 28 and 30, Kansas City, Mo.—Automobile Club of Kansas City's two days' race meet at Elm Ridge track.

May 28-31, Syracuse, N. Y.—Central New York inter-club relay run.

May 29-30, San Francisco, Cal.—San Francisco Motor Club's two days race meet at Tanforan.

May 30, Oklahoma City, Okla.—Oklahoma Automobile Association's reliability contest.

May 30, Bridgeport, Conn.—Bridgeport Automobile Dealers' Association's hill-climb on Snake hill, Fairfield.

May 30, Denver, Colo.—Denver Motor Club's road race.

May 30, Briarcliff Manor, N. Y.—Amateur Automobile Contest Association's hill-climb.

May 30, Denver, Colo.—Denver Motor Club's annual road race.

June 1, Berlin, Germany.—Start of Prince Henry tour, finishing at Homburg on 8th.

June 2, New York City—Annual Orphan's Day outing at Coney Island.

June 3-4, Buffalo, N. Y.—Automobile races at Fort Erie track.

June 4, Worcester, Mass.—Automobile Club of Worcester's annual hillclimb on Dead Horse hill.

June 4, Philadelphia, Pa.—Quaker City Motor Club's race meet at Point Breeze track.

June 6, Atlanta, Ga.—Start of second annual New York-Atlanta Good Roads Tour, ending in New York June 14.

June 7, West Haven, Conn.—Yale Automobile Club's third annual hill-climb on Shingle hill.

June 11, St. Louis, Mo.—Automobile Club of St. Louis reliability contest.

June 11, Newark, N. J.—New Jersey Automobile and Motor Club's 280 miles reliability run.

June 11, Portland, Ore.—Portland Automobile Club's annual road race for Wemme Cup.

June 11, Wilkes-Barre, Pa.—Wilkes-Barre Automobile Club's annual hill climb on Giant's Despair.

June 15-30.—American Automobile Association's seventh annual national touring and reliability contest for the Glidden trophy, starting from Cincinnati and finishing at Chicago.

June 16-22, Albany, N. Y.—Albany Automobile Club's sixth annual tour to Atlantic City, N. J., and return.

June 25, Port Jefferson, N. Y.—Automobile Club of Port Jefferson's hillclimb on East Broadway hill.

July 1, 2 and 4, Indianapolis, Ind.—Grand Circuit meeting on Motor Speedway.

miles an hour on the road. Little is said of the maximum attainable speed at the present time, for the reason that the public has learned that almost any car will go as fast as the inclination of the average driver will require under normal circumstances. The present tendency among manufacturers is to advertise the slowest speed which the car will make on the high gear. But until

the public learns that, like the maximum, the minimum speed is for use only under special and favorable conditions, there is likelihood that abuse of that feature will prevail to some extent, and that high fuel and maintenance costs will result in certain quarters. What is necessary above all else is to teach the operator to favor the engine under all circumstances.

## SPORT ON ATLANTA'S SPEEDWAY

**Southern Course Provides Three Days of Good Racing—Feature Event a Thrilling Contest Run in Rain.**

Although no world's records were broken and few speedway marks were eclipsed, the three days' meeting at the Atlanta (Ga.) Speedway on Thursday, Friday and Saturday last, May 5, 6 and 7, was productive of some good sport. The races were well attended, though the crowds were not as large as the promoters doubtless would have desired. Fair weather greeted the contestants until late Saturday afternoon, when the final race was in progress.

So far as honors are concerned, they were well divided between the most prominent drivers. Ralph DePalma and his Fiat corralled three firsts, one second and two

15:57.41, the former record of 16:27.79 having been made by Robertson at the Atlanta meet last year. As there was no previous record for the distance, Kincaid and Aitken established a 200 miles 451-600 cubic inches category; Endicott established a record for 12 miles—13:21.95. None of these performances is very remarkable, as compared with the times made on the record-breaking board track at Los Angeles.

One of the added features of the meet was an aeroplane exhibition by Charles K. Hamilton, who made noteworthy flights each day, during the progress of the long races. One day Hamilton raced Kjelson, in an S. P. O. car, for four miles, or twice around the track. The man-bird sailed low to the ground and not more than a few feet separated car and airship any part of the distance. The aeroplane won out in the final stretch by a few feet, the time for the four miles being 5 minutes 6 seconds. Previously Hamilton had made one circuit (2 miles) in 2:38 $\frac{1}{4}$ .

breaking. Then the National went through the fence, as previously stated, in the 49th mile, and Clicquot retired at 52 miles, having run most of that distance on three cylinders. Strang got back into the race, but stopped three times before 150 miles, so that he never was a serious contender. By the time he had reached this distance Harroun, in his Marmon, had finished. To hold the interest of the spectators, a special handicap race between Asa C. Candler, Jr., Fiat, and William Stoddard, National, was run while Harroun was grinding off his miles. Candler allowed Stoddard one minute and the latter held the lead for 7 miles, when the Fiat romped past and came home a winner.

The first event of the day—a 20 miles 451-600 cubic inches stock chassis event—resulted in the only record of the afternoon. DePalma won over Aitken in 7:55.41, a record for the class, Endicott, in a Cole, won the 10 miles for cars within the 161-230 cubic inches classification, and Harroun and

THE HAMILTON-DE PALMA FIRST AERO-AUTOMOBILE RACE

thirds, which, upon a basis of 5, 3, 2 and 1 points for first, second, third and fourth, respectively, netted him 22 points. In cash prizes DePalma scooped in \$450. The next highest scorer in points was Ray Harroun, the victorious Marmon pilot, whose three firsts and two seconds netted him 21 points, \$900 in cash and a leg on the Atlanta Speedway \$10,000 trophy. Although he did not win as many races, Herbert Lytle, a familiar figure in all big races, won as much cash as any other individual driver. He scored a first, three seconds and a fourth, but in the race he won the prize was \$500, while a second prize netted him \$300. Altogether his cash prizes amounted to \$900.

The biggest team "killing" was placed to the credit of Robert Kincaid and John Aitken, the National cracks. Together they scored two firsts, two seconds and two thirds, netting them 20 points, \$1,300 in cash, and a grip on the Atlanta Automobile Association trophy, valued at \$10,000. Endicott, in the Cole car, also made an excellent showing, winning every race in his class—three of them; he got two cups and \$300 in cash.

In respect to records, DePalma broke the 20 miles speedway record, 450-600 cubic inches class, by covering the distance in

The only accident of the meet occurred the first day, during the 200 miles race. Aitken, in the National car, had completed 49 miles when the steering gear became deranged. The car went through the inside fence and over a 25-foot embankment. It remained right side up, however, and Aitken and his mechanic were uninjured, while the only damage to the car was two unshipped front wheels and a smashed radiator. But for the fact that Aitken had the presence of mind to shut off the power and apply the brakes when the car started through the fence he damage would have been more serious.

#### Thursday—May 5th.

Seven events comprised the first day's program, but in none of them were the finishes close enough to induce heart failure on the part of the spectators. The 200 miles for stock chassis between 301 and 450 cubic inches, which was to have been the feature event of the day, as the first prize consisted of a log on the Atlanta Speedway \$10,000 trophy and \$600 in gold, was robbed of its interest by mishaps. There were four starters—Aitken, National; Clicquot, Knox; Strang, S. P. O.; and Harroun in a Marmon. Strang was the first to experience difficulty, a steering knuckle

his Marmon car showed a clean pair of heels to DePalma and Aitken in the 10 miles free-for-all. DePalma attempted to break the 2 miles record, but his big car was not running smoothly and the attempt was unsuccessful. The summaries:

Twenty miles for stock chassis, 451-600 cubic inches—Won by Ralph DePalma, Fiat, 15:57.41 (speedway record); second, John Aitken, National, 16:61.08.

Ten miles match, amateur—Won by John Rutherford, Fiat, 8:53.30; second, Stoddard, National, 9:04.45.

Ten miles for stock chassis, 161-230 cubic inches—Won by Endicott, Cole, 10:47.87; second, Fain, Buick, 10:15.15; third, Cohen, E-M-F., 10:31.75.

Ten miles free-for-all—Won by Ray Harroun, Marmon, 7:43.47; second, Ralph DePalma, Fiat, 7:55.71; third, John Aitken, National, 8:06.06.

Two hundred miles for stock chassis, 301-450 cubic inches—Won by Ray Harroun, Marmon. Time, 3:02:31.25. (Only car to finish.)

Ten miles handicap—Won by Candler, Fiat, 7:55.14; second, Stoddard, National, 7:59.00.

Two miles against time—By DePalma, Fiat. Time, 1:32.09.

Friday—May 6th.

The great driving of Herbert Lytle in the 50 miles free-for-all on Friday was the feature of the second day's racing, and but for the fact that he had to stop and change a tire it is almost certain that he would have broken the speedway record for the to finish. At the start DePalma took the distance. The race was exciting from start lead, with Lytle second, the "Yellow Jacket" third, the Marmon fourth and the National fifth. For 6 miles there was no relative change in the teams, but on completing the

Marmon, 0:41.19; third, Walter Christie, Christie, 0:42.79; fourth, Herbert Lytle, American, 0:43.19.

Twelve miles free-for-all—Won by Ray Harroun, Marmon, 8:59.16 (establishing a speedway record); second, Herbert Lytle, American, 9:02.48; third, Ralph DePalma, Fiat, 9:03.58.

Ten miles for stock chassis, 301-450 cubic inches—Won by Herbert Kincaid, National, 8:18.11; second, Ray Harroun, Marmon, 8:43.83; third, Lewis Strang, S. P. O., 9:58.81.

CONTESTING ATLANTA ASSOCIATION TROPHY IN THE RAIN

8th mile the Fiat, with DePalma up, broke a spark plug and dropped back to last place. DePalma trailed the bunch until the 30th mile, when he moved up one position, only to quit altogether at 40 miles. The "Yellow Jacket" went out at 23 miles. Kincaid, in the National, led at 40 miles, Lytle having stopped to change a tire. When Lytle got back into the race the prettiest contest seen on the track developed. Throwing caution to the four winds, Lytle opened wide and started after Kincaid. The crowd was on tiptoe as the cars rounded the last turn, Kincaid slightly in the lead. The finish was superb! Lytle flashed over the line a few feet to the good, with the accompaniment of a volley of cheers.

The 12 miles free-for-all also was a great spectacle. The Fiat got away in the lead, the Marmon second and the American third. At the end of the fourth mile Harroun (Marmon) went to the front and remained there until the 8th mile, when something happened to DePalma and put him out of the running, and Lytle passed Harroun. The last lap practically was a neck and neck duel between this pair, Harroun winning in 8:59.16, and establishing a speedway record for the distance, no previous mark having been recorded. The mile free-for-all went to DePalma, by a margin of a second over Harroun, Walter Christie finishing third. This was the only event of the meet in which the unlucky Christie figured. Endicott also established a class record in the 60 miles event for small cars, which he won. The summaries:

One mile free-for-all—Won by Ralph DePalma, Fiat, 0:40.32; second, Ray Harroun,

Ten miles handicap, amateur—Won by Woodside, S. P. O., 8:26.32; second, Stoddard, National, 10:47.76.

Sixty miles for stock chassis, 161-230 cubic inches—Won by Endicott, Cole, 1:00:28.45; second, Cohen, E-M-F., 1:02:58.90.

Fifty miles free-for-all—Won by Herbert Lytle, American, 40:20.02; second, Herbert Kincaid, National, 40:21.17.

Saturday—May 7th.

Driving through an inch of water, with

Lytle, the latter being 10 miles ahead of Ralph DePalma. The other three cars were hopelessly out of it. It probably was one of the most thrilling events ever witnessed on a track, and the drivers who survived the oil and mud plug richly deserved all they earned. Aitken, however, should not get all the credit of the victory, as Kincaid had the wheel for the first part of the journey.

At the start the American car took the lead, with the National second and the Fiat third. These three cars maintained their relative positions until the 60th mile, when the Fiat, with DePalma up, passed Kincaid, in the National, the latter regaining second place after 20 miles more of fast driving. There was no further change until the 106th mile, when the National car assumed the lead. Aitken then took the wheel at about the same time the rain commenced, and he had the nastiest part of the drive.

When the rain started the real excitement of the event began for the spectators. As each car passed the grandstand it could be seen that the wheels were throwing up sheets of spray that so enveloped the drivers that it was a wonder they could see the track. The water brought the oil to the surface and the footing was treacherous. Tires were thrown in two instances, and in one case the car turned two complete circles in one direction, reversed one and then continued the race. This happened to Lytle at the end of the 120th mile, just before reaching the grandstand. After Lytle's car stopped its gyrations he calmly wiped the oil and dirt from his goggles and proceeded down the stretch. He certainly showed gameness throughout the race, and but for the fact that he had to stop twice to change tires the final sprint between him and Aitken might have made long distance au-

TRIPLE FLIGHT IN FRIDAY'S FREE-FOR-ALL

the wind blowing a gale of 60 miles an hour, the rain pouring in torrents and every revolution of the wheels throwing sheets of spray and oil in his face, John Aitken, piloting a National car, finished first in the 200 miles stock chassis race for the Atlanta Automobile Association \$10,000 trophy, on Saturday afternoon. Aitken finished 5 miles ahead of his nearest competitor, Herbert

tomobile race history. When DePalma finished, Starter Wagner called the race off. Harroun then was running in fourth place. Stoddard in the National was fifth, and Strang in the Allen-Kingston sixth. The Renault, the seventh car to start, left the track after completing 28 miles.

The rain, of course, broke up the meet after the 200 miles event, but before the

water fell two other good races were witnessed. DePalma won the 10 miles free-for-all in fast time and Endicott, in his little winning Cole, captured a class event and established a speedway class record for 12 miles, covering the distance in 13:22.60. The summaries:

Ten miles free-for-all—Won by Ralph DePalma, Fiat, 7:39.40; second, Herbert Lytle, American, 7:43.46; third, Herbert Kincaid, National, 8:19.05.

Twelve miles for stock chassis, 161-230 cubic inches—Won by Endicott, Cole, 13:21.95 (establishing speedway record); second, Cohen, E-M-F., 13:22.60.

ENDICOTT, COLE "30," UNIVERSAL, WINNER IN HIS CLASS

Two hundred miles for stock chassis, 451-600 cubic inches—Won by Kincaid and Aitken, National, 3:02:24.47 (establishing speedway record); second, Herbert Lytle, American, 3:05:10.25; third, Ralph DePalma, Fiat.

#### Sensational Spill in California Race.

Starting seventh in a field of eight, Frank Free, driving a Winton car, won the Fresno-Coalinga (Cal.) 64 miles road race on the 1st inst. in 1:11.43, and clipped 13 minutes from the former record for the course. Nick Nickrent in a Buick was a close second, in 1:14.52 and Stone in a Great Western third in 1:19.32, all three getting inside the old record. The race was marked by a sensational accident, in which Frank Murray at the wheel of a Buick narrowly escaped being killed. While attempting to pass a non-contesting car on a level stretch Murray was temporarily blinded by a cloud of dust and plunged into the rear of the other car at full speed. After turning three somersaults, the Buick landed in a field 45 feet from the road, a wreck, and Murray was picked up unconscious. Not having sustained serious injuries, he soon was revived, and later competed in the track meet at Coalinga.

## TIGHTENING ANTI-JOY RIDE LAW

**Technical Loophole, Through Which Offenders Escaped, to be Closed—Amendment that Serves the Purpose.**

Following the release by Judge Malone of two men who had "borrowed" an automobile standing in front of the Chalmers garage in New York, because the present law relating to unauthorized use of motor cars did not specifically include the streets of the city, Assemblyman Harold Spielberg

years have held "horse trots" on a portion of the Coney Island Boulevard to the inconvenience of all other traffic, have found two other legislators anxious to do their bidding. Senator Cullen and Assemblyman Goodspeed are the men in question. In their respective branches of the legislature they have introduced measures restricting the use of the boulevard from Twenty-second avenue to King's Highway to light drawn vehicles, thereby barring bicycles and motor cars.

#### Vanderbilt Spectator Gets Big Verdict.

An echo of the 1906 Vanderbilt Cup race was the award this week of a verdict of \$7,000 to Ralph S. Baldwin, the fourteen-year-old boy who was run into and badly injured on the fifth lap of the contest—the same in which Joseph Tracy made the fastest time of the day. Although it was announced at the time that the boy had been injured only slightly, suit was brought against the Locomobile Co. of America for \$25,000 damages. In addition to the \$7,000 which was awarded the boy, his father, Dr. Winfield S. Baldwin, of East Norwich, Conn., was awarded \$1,000 for costs.

#### Another Pathfinder on Its Way.

With auspicious skies overhead and flying pennants advertising the promoting newspapers, the Columbia pathfinding car which will carry the "scouts" who will lay out the route for the second Good Roads tour from New York to Atlanta, Ga., next month, started from Herald Square on Saturday, 7th inst. At the wheel was Henry Rolfe, a factory driver, while the other occupants were L. M. Bradley, advertising director of the United States Motor Co., which tendered the car for the work, Photographer Lazarnik and a representative of the promoters.

#### Carris "Treking" at Cometlike Speed.

C. S. Carris, driving a Franklin touring car, now is engaged in what is styled "the Franklin trek," a 3,500 mile circuit that will take him into 50 of the principal cities east of the Mississippi. That he is not trying to see how slowly he can travel is evidenced by the fact that he drove from Syracuse to Boston, 350 miles, the first day, and from Boston to New York, via a circuitous route, 285 miles, the next day. He still was "hitting it up" when last heard from.

#### "Touring Club" Acquires More Room.

Having outgrown its former home at 239 West Fifty-fourth street; New York City, the Touring Club of America, Inc., which consists largely of A. L. Westgard, has taken more commodious quarters in the Jones Speedometer Building, at Broadway and Seventy-sixth street, occupying the two floors recently vacated by the United Manufacturers. It is said that over 2,000 "subscribers" now do their touring via T. C. A. diagrams.

of the 10th Assembly District, at the request of Carl H. Page, has introduced an amendment to the present anti-joy riding law which is designed to cover the point. The paragraph, amended accordingly, has been referred to the Committee on Rules. It reads:

"1,293a. Unauthorized use of vehicles. Any chauffeur or other person who, without the consent of the owner, shall take, or cause to be taken, from a garage, stable, or other public building or place, [including a public or private lot, yard or driveway, or a public highway, street, alley, park or other public place,] an automobile or other motor vehicle, and operate or drive or cause the same to be operated or driven for his own profit, use, or purpose, steals the same and is guilty of larceny and shall be punished accordingly.

"This act shall take effect September first, 1910."

The words in brackets constitute the amendment that has been offered.

#### Brooklyn "Horse Trotters" Bob up Again.

Although the sponsors of the Lee-Schultz bill in the New York legislature abandoned it to its fate when its real nature was exposed, the Brooklyn horsemen who for

## VIRGINIANS IN ENDURANCE RUN

**En Route They Shake Hands with President Taft and Are Held up by Constable—Four Clean Scores.**

Marked by a most unusual defection in the ranks of the entrants when time was called, the three days "good roads" endurance run promoted by the Richmond (Va.) Times-Dispatch on May 5, 6 and 7, attracted 23 starters, 19 of whom were actual contestants, and 5 of them finished the 468 miles run with perfect scores. When the entry lists closed there were 33 nominations in hand, but for various reasons 14 of the entrants failed to show up at starting time and the other four starters were new contestants. The cars were divided into 7 divisions, according to the price classification of the American Automobile Association, under whose sanction and rules the contest was held.

Those who finished with perfect scores were Evans Maxwell, Hudson; Lee Foelger, Buick; F. E. Nichols, Reo; J. R. Williams, Buick, and E. J. Allen, Rambler. Each of these will receive a cup for their performance and, in addition, they tied for the Sweepstakes Cup, possession of which is to be decided by a drawing to be held by the owners of the winning cars. Another cup winner was John B. Swartwout, Stevens-Duryea, who, although not coming through clean, was the only one in his division to finish.

Accidents commenced early, the first one occurring at Calbert, where, in fording a creek, Dr. R. C. Bryan's Chalmers was run into by L. M. Foster's Buick. The latter car was badly damaged but continued in the run. The first to be eliminated was D. D. Daniels, Hupmobile, who approached a bridge near Orange at high speed and collided with it. Daniels was thrown against a tree and rendered unconscious, and although not seriously injured he retired under orders of his physician.

The first day's run was to Washington, D. C., 178 miles, and the greater part of it was over such good roads that the motorists arrived at the night control several hours ahead of their schedule. The cars were parked for the night in front of the National Museum under police guard, and by midnight 17 had reported.

Before leaving the capital on Friday, 6th, the contestants drove to the White House, where they were greeted by President Taft, who, after shaking hands with each member of the party and being photographed with them, made a short speech congratulating them on the cause which they represented and of which he was heartily in favor and wished them success. The second day's run was to Harrisonburg, W. Va., 139 miles. Rocky roads and hills were frequent on the

run to Winchester and much tire trouble was experienced. Several of the cars were delayed by tire trouble and others lost time with broken springs, which added to their penalizations.

An early start from Harrisonburg was made on Saturday, 7th, the final day for the homeward run to Richmond, and several of the lucky ones who escaped trouble repeated the usual performance of finishing from two to three hours ahead of the schedule. The only untoward incident of the contest occurred near Mount Crawford on the last day, when three of the cars were held up for speeding by a constable on the outskirts of the town, who declared he had been delegated by the Mayor to corral those who exceeded the limit of 12 miles an hour. After fruitless argument the Mayor was summoned and held court on the spot, assessing each of the drivers \$10, which was paid. During the enactment of the little farce some of the tourists who came along later managed to get by successfully without being held up, as the minions of the law were too busy to notice them. Others who discerned from a distance what was occurring turned back and went through the town by another road which was pointed out by some kindly villagers. The action of Mount Crawford's Mayor universally was condemned.

For the first time during the run rain fell—on the last day; but this did not serve to dampen the enthusiasm of the crowds that lined the streets of the towns, and at Fife the most enthusiastic welcome of the trip was accorded, banners being stretched across the road, while little girls tossed roses into the machines as they passed. At Rio Vista a delegation from the Richmond Automobile Club met the returning motorists and escorted them to the final control, where 16 checked in. After a technical examination the scores were announced, as follows:

### Division 2A—Cars listing between \$801 and \$1,200.

Driver and Car.	Penalizations, Points.
Evans Maxwell, Hudson	0
R. T. Taylor, Ford	12
I. J. Tignor, Overland	73
F. Schwartzschild, Buick	185

### Division 3A—Cars listing between \$1,201 and \$1,600.

Lee Foelger, Chalmers	0
F. E. Nichols, Reo	0
Palmatary, Chalmers	290
Dr. S. H. McNally, Maxwell	317

### Division 4A—Cars listing between \$1,601 and \$2,000.

J. R. Williams, Buick	0
B. A. Blenner, White	20
E. J. Allen, Rambler	27
L. M. Foster, Buick	1,206

### Division 5A—Cars listing between \$2,001 and \$3,000.

E. J. Allen, Rambler	0
Dr. R. C. Bryan, Chalmers	7
Dr. B. L. Hillsman, Olds	15

### Division 7A—Cars listing \$4,000 and over.

J. B. Swartwout, Stevens-Duryea	—

## SALT LAKE CITY SEES FIRST MEET

**And the Sport Was Exciting Enough to Please All—B. Oldfield & Co. Make Several Showings.**

Salt Lake City, which, needless to say, is in Utah, experienced its first taste of automobile racing on Saturday and Sunday last, May 7th and 8th, and, like the little child who had eaten all his candy, "cried for more." Despite the fact that Colonel Bill A. Pickens's genial personality and bar checks secured much advance publicity for Ben Kercher and Barney Oldfield, they were not the only thrill-makers.

There were a number of features at the first day's meeting, three of the events furnishing eyelash finishes, and they were so exciting that even Jack Prince, who built the Los Angeles mile track, and who is in Salt Lake City for a similar purpose, was moved to applaud. Another exciting incident was when Bert Smalley threw a tire and plunged through the fence, with no worse results than two broken fingers. The exhibitions of Oldfield and Kerscher were tame affairs, the former doing 55 seconds and the latter 58 seconds for the mile.

There were several stirring finishes and exciting incidents during the first day's racing—events so exciting that the crowd of 3,000 persons were in an uproar from start to finish. One of the closest events was the 5 miles scratch for stock chassis, which Bert Smalley won by a length in 5:55½. Frank Irving in a Thomas Flyer was the runner-up, and Bert Angell and Carl Winters were only a few yards behind at the tape. Another nerve-tingling race was the 5 miles handicap for stock chassis, which Bert Angell won by a yard from Frank Irving, the latter driving his Thomas Flyer. Oldfield won a 3 miles special handicap handily with his Knox, but was beaten by Carl Winters in the 5 miles free-for-all handicap by the narrow margin of a wheel's diameter. The summaries:

One mile against time—By Barney Oldfield, Benz. Time, 0:55. By Ben Kerscher, Darracq. Time, 0:58.

Five miles scratch, for stock chassis—Won by Bert Smalley, American; second, Frank Irving, Thomas; third, Bert Angell, Buick. Time, 5:55½.

Three miles handicap match—Won by Barney Oldfield, Knox (0:10); second, Ben Kerscher, Darracq (scratch). Time, 3:20¾.

Five miles handicap, for stock chassis—Won by Bert Angell, Buick (0:35); second, Frank Irving, Thomas (scratch); third, A. F. Savage, Hupmobile (1:30); fourth, Carl Winters, Buick (0:45). Time, 6:23¼.

Five miles handicap, free-for-all—Won by Carl Winters, Buick (1:30); second, Barney Oldfield, Knox (0:20); third, Ben Kerscher, Darracq (scratch). Time, 6:41.

## MISS SCOTT TO CROSS CONTINENT

Woman Driver and Companion to Essay the Feat—Not a Fireworks Affair, but a Touring Demonstration.

Miss Scott—Miss Blanche Scott—is going to cross the continent, and in an Overland car. She will start from New York City on Monday next, 16th inst., and if she does not reach San Francisco it will surprise not a few of those who have met her. She is a bright, ambitious, bustling little woman who came to New York from Chicago a year or so ago, and here, as there, she has been acting as an automobile

of committees of welcome or by other of the means ordinarily adopted to mark the progress of a political organization committee or a circus. Instead the procession of one car will pass through hamlet and village unheralded save in sections where the coming of any car would be an unusual event, and indistinguishable from other cars save by the lettering on the side of the luggage compartment, which bears this modest device: "The Car, the Girl and the Wide, Wide World."

The car itself is a regular stock Overland runabout of 25 horsepower, which lists at \$1,000 and carries Goodyear "Q. D." tires, and standard equipment in every respect. Its only unusual feature is the luggage locker on the rear deck, which is especially

MISS SCOTT READY TO START HER OVERLAND TRIP OVERLAND

saleswoman and demonstrator for women purchasers—not overlooking the man buyer—and generally seeking to prove that womankind is as competent to handle steering wheel and levers as to hold a pair of reins.

She has been anxious to demonstrate the fact, and the Overland people have afforded her the opportunity. She is to set forth accompanied only by Miss Amy Lyman Philip, a lady of ripe experience as a foreign traveler and motorist, who, like Miss Scott, not only knows how to drive a car but is thoroughly familiar with its mechanism as well. No mere man mechanic will be included in the impedimenta of the trip, the ladies being absolutely convinced of their joint ability to cope with any emergency which may arise in the course of the journey. Such extra supplies and heavy repair-work as may be required will be secured at points along the way, one of the objects of the demonstration being to show that two energetic women cannot be stranded anywhere in this broad land.

It is explained in advance that the arrivals and departures from the various points of call on the journey will not be signalized by the firing of rockets, organization

constructed to hold four dress suit cases and a liberal repair outfit. This will suffice for the earlier stages of the journey; but at Granger, Wyo., a "Western outfit," including a tent and other camping utensils and baggage will be added.

The itinerary out of New York will be the well-traveled one as far as Chicago. From the Windy City, the route is mapped to touch at Milwaukee, Dubuque, Omaha, Hastings, Denver, Cheyenne, Laramie and Granger. The more serious part of the undertaking will be encountered after the departure from the latter point, whence the expedition will call at Ogden, making a side trip to Salt Lake City, Tacoma, Ely and Goldfield—this region of frontier romance not being included in the usual transcontinental program. From Tonopah the course will lie across the desert to San Francisco by way of Los Angeles. No attempt will be made to follow a fixed schedule, nor effort made to break records, and in every respect the trip will partake of the nature of a leisurely sight-seeing trip such as any two women might take without the idea of demonstrating anything except their own ability to look out for themselves.

## STRIKING FLORAL DECORATIONS

Chicago's Parade Brings Out Some Beautiful and Unique Designs—The Ones that Secured the Awards.

To select a coterie of 11 "best decorated" cars from a field of over 150, most of which represented an individuality and artistic effort worthy of reward, and at the same time retain the good will of the non-winners, was the well-nigh impossible task assigned to the judges of the Chicago Automobile Trade Association's floral parade on Monday last, 9th inst. It was the first annual affair of the sort under local trade auspices, and although somewhat marred by the postponement from the previous Saturday, on account of rain, which considerably cut down the number of participants, it nevertheless was the largest ever held in Chicago.

Comparatively few of the cars were embellished with natural flowers, but those which were made a handsome appearance. The first prize in this division was easily won by D. J. Joyce, in an Alco, which was a veritable bower of American Beauty roses. Joyce's win was an expensive one, for the postponement of the parade necessitated a duplicate order of flowers to replace those originally intended for Saturday. Thomas Murray, with a special limousine bedecked with roses, carried off second prize, and F. J. Paterson's Stearns similarly dressed, received honorable mention.

For cars using artificial flowers, an Oldsmobile entered by the local agency was conceded to "outblossom" its rivals, the color scheme being purple and white, clematis blossoms being used to further the effect. The occupants were young ladies dressed in white duck with purple and white hats. The impending visit of Halley's comet was anticipated by a White, which was rigged up with white and yellow chrysanthemums, and a huge yellow ball and streamer carried aloft to represent the celestial visitor. This effort was rewarded with second prize. A Royal Tourist, in keeping with its name, carried as passengers several European "royalties" and received honorable mention.

The judges had a hard time selecting the winner in the electric division, but finally settled on a Detroit, its embellishment suggestive of flight aiding in the selection. The car itself was covered with white chrysanthemums, while before it "flew" a bevy of huge butterflies, lending the impression that the winged insects were drawing the vehicle. Deprived of first place, the Baker, rigged up as an immense swan and appearing very realistic, took second award without serious opposition.

In the private owners' class a Winton

showered with red poinsettias carried off first award and the consolation went to a McFarlan, driven by Mrs. C. A. Coey. There was much rivalry among the entrants in the float division, and the surprise sprung by Manager McNab of the Maxwell branch easily surpassed the other arrangements. McNab, who is a canny Scot, had rigged up a Maxwell to represent Scotia, and was very strong on details, having heather and thistle from his native land and a quartet of Scotch pipers to extract Highland airs from the bagpipes. This float was one of the hits of the parade. Appealing strongly to the great army of baseball "fans," the Overland display was very striking and took second honors in the float class. Faithfully duplicated to the smallest external detail was a huge baseball built of white flowers, with a violet hued bat of proportional size, which pierced the immense sphere. Surmounting the ball were figures representative of both the big league ball teams in the Windy City.

Other strikingly decorated cars were a Locomobile covered with yellow and white chrysanthemums and Mercury wings on the wheels, a Brush with a golden crown covered with flowers, a Selden torpedo suggesting a flower-laden yacht with the sails, manned by girls, and a Hupmobile rigged up as a locomotive, the only things necessary to complete the realism being steel rails and the hiss of steam.

#### The Car that Accompanied Weston.

Ordinarily an automobile when crossing the American continent tries to make some sort of speed record, but the 12 horsepower Maxwell runabout which accompanied the veteran walker, Edward Payson Weston, on his jaunt of 3,500 miles, performed a lot of even more trying work—slow-speed travel and often with unusually heavy loads on "fierce" roads. Despite the fact that the car was not washed or polished during the long trip, according to the statement of the driver, Dundas Kinnaird, no adjustments or repairs were made on it, with the exception of a feed pipe running to the carburetter which was worn by vibration. The car was employed for carrying Mr. Weston's baggage and cooking utensils, and conveyed hundreds of newspaper men; at one time twelve men were on the car at once.

#### Simple Means of Plotting a Route.

For laying out a proposed route on a road map, a very good tip is that suggested by an old-time tourist who follows the plan of using a number of short lengths of very fine chain, such as is used for eyeglasses, for example. When laid down on the map the chain readily lies over any road which it may be desired to follow, taking its curves easily and affording an easy method of tracing the route without straining the eyes or defacing the map. By using several short lengths of chain, branched routes may be picked out.

## COLLISION MARS MORGAN'S RUN

**But His Old Friends, the Hotel Keepers, Obtain Their Bits—31 Starters; Survivors Being Counted.**

The two days' reliability run from New York City to Atlantic City, N. J., and return, which W. J. Morgan conducted on the 10th and 11th under the title of the Motor Contest association, which is one of his several aliases, finished so late last evening (Wednesday) that the official report was not ready at this writing, although it was said that 27 out of 31 starters had finished. Inquiry at Morgan's office revealed the fact that the report would be ready some time to-day, in ample time for publication in the afternoon paper with which Morgan is connected.

The contesting cars were divided into seven classes, according to the American Automobile Association's price classification, and started from Columbus Circle at 8.30 Tuesday morning for Atlantic City. After crossing the ferry to Jersey City, which was the real starting point, the cars were checked out. The contest had not long been under way before a serious accident occurred to one of the contestants—Dr. D. A. Dallas, of Montclair, who was driving a Koehler car. Near Elizabeth, while bowling along in the open, Dallas collided with a Ford driven by W. H. Mount, which was approaching from the opposite direction. Both drivers turned out to avoid a covered wagon, the hood of which temporarily obscured their view and prevented them learning of each other's intentions. Five persons were injured in the crash, Dallas sustaining a scalp wound and bruises, while Mount had four ribs broken. Two lady passengers in the Koehler car were seriously injured, while the chauffeur, J. L. Breyer, sustained a dislocated knee and bruises. The cars were badly damaged.

Lakewood, the noon control, was 90 miles out, where an enforced stop of one hour was made for lunch. The afternoon run to Atlantic City was 66 miles, making the total for the day 156. The seaside resort was the rendezvous of two reliability contests on Tuesday night, the contestants in the Motor Club of Harrisburg's run also checking in there, so that both parties fraternized with each other. More than two-thirds of the New Yorkers completed the first day's run with scores intact. Rain on the second day made the going harder and brought penalizations to some who hitherto had escaped.

The starters and the cars they drove were as follows: Lewis Strang, Pierce-Racine; R. Newton, Stoddard-Dayton; F. Warming-ton, Cole; H. F. Earl, Auburn; W. C. Poretner, National; Paul Harvey, Franklin; Joseph Kingsland, Zust; Joseph Bell, Chalm-

ers; H. S. Clark, Mercer; Leo Anderson, Midland; Charles Hinman, Mora; W. H. Bowers, Regal; Charles F. Fox, Franklin; W. C. Davenport, Buick; Philip Hines, Buick; O. K. DeLamater, Mitchell; Robert W. Flagg, Welch-Detroit; L. M. Bradley, Maxwell; W. E. Shuttleworth, Haynes; George L. Reiss, Overland; J. L. Breyer, Koehler; Neil Whalen, Matheson; V. P. Pisani, Zust; R. G. Gillan, Hupmobile; E. D. Cutting, Hupmobile; Charles Schaefer, Maxwell; O. P. Bernhart, Croxton-Keeton; W. F. Bradley, Maxwell; L. P. Burne, Cadillac; N. L. Lichtenberg, Cadillac; Joseph Trehou, Mercer.

#### Tells Motorists a "Touching" Tale.

New Jersey automobilists visiting New York during the past few weeks have been made the victims of a new confidence game, in which an automobile accessory, a young man with a chauffeur's cap and the name of some garage located in Paterson, Newark, Montclair or the Oranges, play important parts. The young swindler's plan is to approach a machine at the New York entrance of the ferry house with a gearing, connecting rod or similar part of the machinery in his hand, to which a tag has been attached. One of the male members of the party is called aside and informed in a confidential manner that the man is an employe at one of the garages in this and that place, and had been sent to New York to get the part which he holds. He declares that his pocket has either been picked or that he lost his wallet, containing his railroad ticket. He completes his story with a modest request for the loan of \$1. The loan will be returned if the automobile owner will stop at the garage where he is employed. In nearly every case the motorist is caught by the plausible tale and the modest behavior of the swindler, and helps the fellow by handing out the amount requested. Inquiries at the various garages have been made, but without success. The swindler usually gave the name of Charles Fairchild.

#### Doctor's Car with an Unusual Record.

To use a car for two years to the extent of 29,463 miles, and to wash it but three times during that period, certainly is "going some." Louis Engel, the Cartercar agent at Buffalo, who just has become possessed of such a car, believes that it thus holds the "non-wash endurance record." The machine was turned in for a new Cartercar by Dr. Carr of Buffalo, who avers that but fourteen hours were spent during the two years in repairing, while the original spark plugs were still in the engine and, according to the doctor's statement, had never been removed nor cleaned. The car is still in good running condition, and Mr. Engel is questioning seriously the advisability of giving it a bath at this late date. In fact, he believes it holds a record of which few "hobos" can boast.

## HARRISBURG'S HARD CONTEST

**Rain During Two Days Makes the Going Sloppy—Technical Examination Necessary to Decide the Winners.**

Because of the hard racking they received it is thought unlikely that any of the cars in the three days' endurance contest promoted by the Motor Club of Harrisburg, Pa. which finished in that city last night, will receive perfect scores. Apparently seven

Harrisburg, Pa., at 7 a. m., under auspices that were not encouraging. Fifty cars got away without unusual incident, there being 21 cars in the manufacturers' class, 17 in the club members' division, and 12 official cars. The latter were alive with flags and there was no mistaking them.

The first stage of the journey led the drivers to Lebanon, and this really was the hardest part of the run, as it rained from the time the first cars set out from Harrisburg until the last cars checked in at Lebanon. Considering the fact that many

appreciated. Between Norristown and Jeffersonville there were several dangerous depressions in the road and railroad crossings that might have brought grief to the cars but for the thoughtfulness of the club in stationing couriers at these points. In fact, considerable interest was shown in all the towns passed.

After leaving Philadelphia the enduranciers encountered another rainstorm, but the excellent roads between Philadelphia and the sea are so constructed that they absorb the water almost as soon as it has fallen. As a result, no cars lost points between the Quaker City and Atlantic City.

The day's run of 168 miles brought disappointment to only four drivers in the manufacturers' class, a penalty of 15 points being assessed against G. F. Snyder, Mitchell; 4 points against H. P. Hardesty, Pullman; 19 points against E. Yeager, Columbia, and 27 points against W. P. Sieg, Kline-Kar. No reports were made for the members' division. The following manufacturers' cars had perfect scores:

J. A. Kline, Kline Kar; R. L. Morton, Kline Kar; C. C. Fairman, Kline Kar; Samuel Cole, Kline Kar; Frank Hosmer, Regal; John Burns, Franklin; Herbert Welker, Pullman; Norman Gallatin, Pullman; Herbert Bitner, Pullman; George Ickes, Pullman; W. W. Vandergrift, Inter-State; Thomas Berger, Warren-Detroit; H. L. Brownback, Enger; E. Greenwood, Marion; C. Greenwood, Overland; William McCalla,

HARRISBURGERS ARRIVING AT PHILADELPHIA

cars had no road penalties against them but it was given out that all the cars were more or less loose in parts or adjustments and that no scores would be announced until the technical committee has made an exhaustive examination of those that finished. No results will be announced until late tonight or Friday morning.

The contest began on Monday morning, 9th inst., the first day's journey taking the contestants from Harrisburg to Atlantic City, through a rain storm that damaged several scores. The second day's ride on Tuesday was from Atlantic City to Wildwood over a circuitous route through southern New Jersey, and the last leg of the journey was from Wildwood back to Harrisburg.

There are two classes competing for the numerous trophies offered by Harrisburg interests—a manufacturers' class and a class restricted to members of the Motor Club of Harrisburg, with the owners driving. In each class there are four subdivisions, as follows: Class A, touring cars listing at \$2,001 and over; Class B, touring cars listing at \$2,000 and under; Class C, roadsters listing at \$1,601 and over, and Class D, runabouts listing at \$1,600 and under.

**First Day—Monday, May 10.**

With a drizzling rain dampening the ardor of the contestants, the first day's run to Atlantic city started from Market Square,

CHECKING IN HARRISBURG CONTESTANTS IN THE RAIN

of the roads were rough and hilly, it is remarkable that so many got through without marks against them.

From Lebanon the contestants had fairly plain sailing into Reading, and from that city to Pottstown, Norristown and into Philadelphia, which was designated the noon control. The pilot car was the first to arrive in Reading, at 7.30 a. m., the remaining cars arriving within half an hour.

The Norristown Automobile Club showed its interest in the run in a way that was

Kline Kar, and A. D. Rea, Maxwell.

**Second Day—Tuesday, May 10.**

If the first day's going bordered a bit on the strenuous it was parlor car riding on Tuesday, and the dominant feature was the hospitality extended the visiting motorists in all the towns through which they passed. The route was from Atlantic City to May's Landing, Vineland, Alloway, Salem, Bridgeton, Millville and Cape May Courthouse to Wildwood, a distance of 137.6 miles.

The only withdrawal during the day was by G. F. Snyder, who had suffered a penalization of 15 points on the trip from Harrisburg to Atlantic City. Snyder experienced further trouble, which practically put him out of the running insofar as a perfect score was concerned, although he continued in the run as a non-contestant.

The reception at Vineland was out of the ordinary. That city is off the route of most endurance runs, and consequently the advent of half a hundred automobiles at one time was an event unprecedented in its annals. The town therefore was decorated in honor of the endurance hosts, the public schools declared a holiday and the municipal brass band met the tourists at the entrance to the city. One of Vineland's principal products is unfarmed grape juice, and to impress this upon the tourists each pas-

the Harrisburg Motor Club came to an end. The run of 196 miles from Wildwood, N. J., to Harrisburg, Pa., was undoubtedly the severest part of the journey. The run from Wildwood to Philadelphia was through a terrific rainstorm, which made the roads a sea of mud and delayed the drivers considerably. The delay caused the contestants to lose little time in Philadelphia, and a cup of coffee and a sandwich was all the dinner most of them allowed themselves. Despite the fact that in the larger cities passed through there was the usual quota of curiosity seekers, the reception accorded the contestants was cold and distant compared to the first two days.

The cars began arriving in Harrisburg a few minutes before 5 o'clock, and all of them were checked in before 5.30 p. m. Four Kline Kars and two Pullmans, with

worse than by allowing it to race at high speed without load.

Don't advance the spark lever when cranking.

Don't shift the gears without first releasing the clutch.

Don't apply the brakes hard except in an emergency.

Don't start before seeing to the gasoline, oil and water.

Don't tear the motor to pieces. Locate the trouble first.

Don't allow the machinery to be covered with dirt. Wipe it often.

Don't let in the clutch suddenly.

Don't hurry when operating the car and gear shifting lever.

Don't allow the motor to knock by reason of having the spark lever advanced too far ahead on heavy grades or when pulling

OFFICIAL CAR IN HARRISBURG ENDURANCE RUN

SHOWING ITS NUMEROUS BANNERS AND SIGNS

senger was presented with a large bottle of the delicious fluid. Every car also was decorated with "Vineland" pennants.

The reception at Wildwood also was enthusiastic. The automobile club had prepared an elaborate luncheon and reception, while a splendid orchestra discoursed music. Varied entertainment was provided in the evening, when the North Wildwood Automobile Club presented the Harrisburg organization with a sterling silver cup 24 inches in height.

Despite the easy going, there were a number of additional penalizations during the day. Frank Hosmer, Regal, was taxed 6 points; Herbert Bitner, Pullman, lost 1 point, and George Ickes, who piloted a car of the same make, had 15 points marked against his perfect tally. The others who fell from the clean sheet category were H. L. Brownback, Enger, with 9 points; C. Greenwood, Overland, with 12 points, and William McCalla, Kline Kar, who was penalized 3 points.

Third Day—Wednesday, May 11.

With 9 of the 21 cars that started in the manufacturers' class finishing with perfect road scores, the fourth annual contest of

a Franklin, Marion and Maxwell, were the machines to finish the 500 miles run with perfect road scores, but it was announced that no definite figures would be given out until to-day (Thursday). After finishing, all the machines were locked up and will be given a thorough test by the technical committee, and from Harrisburg reports it is thought that no cars will escape this final examination.

#### Decalog of Valuable "Don'ts."

"Advice is cheap" may be a trite saying, but nevertheless it often is very valuable to the recipient. The average novice in automobile driving is apt to get advice of the good, bad and indifferent sort from all kinds of well-intentioned people in staggering quantities, and it is "up to him" to pick out the good from the bad, the chaff from the wheat. The sort of advice given by the Hudson Motor Car Co. to the users of its cars may be accepted and utilized advantageously by the owners of other cars. It is condensed in a decalog of "Don'ts":

Don't race the engine. If you release the clutch the engine will run away. Close the throttle. You cannot abuse the motor

a heavy load. The driver will, however, find it best to keep his spark advanced where the pull is slight as the motor works cooler and uses less gasoline.

#### Suggestions for Prolonging Tires.

With the intent of relieving the owner of a motor car as much as possible of the troubles incident to the use of pneumatics, one of the prominent automobile concerns gives its customers the following good advice: Remove the tires from your car every 1,000 to 1,500 miles, separating the tubes from the shoes, cleaning each carefully and rubbing each with soapstone, scrape the rim and put on some graphite. Vulcanize all cuts and punctures so as to keep dirt and dampness from the fabric. It is advisable every once in a while to change the left hand tire to the right hand wheel. The valve stem of the inner tubes should be occasionally tested, so that the tire may not run partially flat, thereby injuring the fabric. Inner tubes should be carried in a dry place and away from oil and grease. Tires should be pumped up hard. Carefully following these suggestions will result in considerably increasing the average life of a tire.

**MOTOR CARS FOR EMERGENCY USE**

**How They Are Thus Employed by a New York Gas Company—Comparison with Cost of Horse Service.**

Despite the fact that hospital ambulances, police patrols, fire engines and similar "trouble wagons" occupy such an important part in the safeguarding of life and property in the large cities of the civilized world, it is not always easy to get reliable and unbiased reports comparing the old-style horse drawn vehicles of this class with the more modern motor propelled wagons. A notable exception to this general statement

has rear entrance, and two side lockers extending the entire length of the same and containing the repair tools, searchlights, safety helmet, first aid to the injured kit, etc. The lockers also provide seats for six men. The crew numbers five men at night and four men during daylight hours; the driver in each case being exempted from repair work.

As it is, of course, of the utmost importance that a complaint of leaking gas be responded to with the greatest possible speed, the practical efficiency of the department is dependent upon the promptness with which it responds to a call. When a representative of the Motor World called at the emergency station at 80 Elizabeth street, the crew just had returned from a

ceeds at once to the address given, the alarm gong usually insuring a clear passage. Immediately on arrival, the source of the trouble is determined. If it proves an inside leak, caused by broken house pipes, fixtures or meters, it is speedily repaired and the crew returns to the automobile. The foreman then telephones to the station to find out if any other call has come in the meantime, in order that it might be attended to direct, instead of returning to the station. If the accident is a more serious one, involving the rupture of a big main in the street, the men at once set up their searchlight, and proceed to open up the street. While engaged in this work the driver of the car, who possesses a list of all the company's workmen living in that district, collects a force of these and rushes them to the scene. They then take up the work of locating and repairing the leak, while the emergency wagon with its crew returns to the station to be ready for other calls.

Frequently the emergency crews are called in to assist the firemen at a blaze, their duty in such cases being the shutting off of the gas supply of the buildings. In order that the firemen and policemen readily may call out the emergency crews, small gummed labels are supplied them to be pasted in the helmet or cap, which give the several emergency districts with the telephone numbers of the stations.

The members of the emergency crews have nothing but praise for the good performance of the cars, and express themselves very emphatically about the advantages of the automobile over the horse-drawn trouble wagons formerly used. As one of the men put it: "Them horses in slushy weather was making more trouble for the men in the wagon than the trouble wagon could handle."

A careful record of the cost of maintaining automobiles in the emergency service proves that there is little to choose between the motor car and the horse-drawn wagon, the cost of operation and maintenance being practically the same in both instances, when single horse shifts are employed. In winter, and when traffic is hindered by slush and snow, two horses have to be used on each wagon, making the cost of the latter higher than that of the motor car.

**Comparison of Operating Cost per Month.  
Automobile.**

Chauffeurs .....	\$165.30
Gasoline and Oil .....	8.45
Fire expense .....	12.82
<b>Total .....</b>	<b>\$186.57</b>

**Horse-Drawn Vehicle.**

Drivers .....	\$131.75
Horses (including all stable charges) .....	53.66
<b>Total .....</b>	<b>\$185.41</b>

The cost of repairs and depreciation have not been included in the above comparison, but the company's experience to date shows that the repairs and depreciation on the au-

EMERGENCY TROUBLE WAGON OF NEW YORK GAS CO.

are the emergency wagons of the Consolidated Gas Co. of New York City, three of which have been in service for several months.

Although firemen, belonging to the regular fire department of the city, are supposed to fight any blaze occurring within the limits of the city, often it is found impossible to attack the fire with any degree of efficiency, unless the gas supply to the house is shut off. In these cases help from the gas company had to be obtained, and this usually was sent by a slow moving horse and wagon. Finding that much time and money was lost in this manner, the Consolidated Gas Co. installed an automobile emergency service, which is doing excellent work.

For the purpose of quick service Manhattan Island is divided into three sections, in the center of each of which is located one of the "trouble stations." The equipment of each station consists of an automobile, carrying a complete emergency repair outfit, and a crew of several men. The machines are 35 horsepower models, with special bodies placed on the stock chassis, 36x4-inch Diamond smooth tread tires, and provided with one spare wheel each. The body

call to Leonard street, where a fallen chandelier had snapped the gas pipe and the gas was rushing into the house at a great rate, threatening a disastrous explosion. The man in whose flat the accident happened rushed across the street to a telephone pay station and called up the trouble department. He had barely reached his own door when the automobile dashed up to the curb and the crew started to stop the leak. The total time elapsed between the calling up and the arrival of the car was two minutes. The majority of complaints of leaking gas or accidents are reported to the company's emergency stations per telephone by policemen, firemen, janitors and tenants. The man on duty at the telephone, immediately on receipt of a call and before waiting to take the details of the complaint, sounds an electric alarm which summons the crew, who at once start for their quarters. In the meantime the telephone man has secured the address, written it on a ticket, and a messenger hands it to the foreman as the machine passes out of the yard. The record time for the whole proceeding is eight seconds, and at no station does it exceed fifteen seconds.

The automobile, leaving the yard, pro-

tomobiles will be approximately the same as those needed on the ordinary "trouble wagon." Adding to this the depreciation on livestock, the comparison becomes much more favorable to the automobile, as horses depreciate rapidly in the service demanded of them.

The rate of speed in responding to calls is now limited by city ordinance to fifteen miles an hour, and this rate is constantly maintained. Compared with the speed of the horse vehicles, and even with the speed limit strictly observed, the automobile shows a great advantage. Twelve calls taken at random from the records, when the

tant the call may be. On very short calls the two kinds of wagons would be equally efficient, but if a number of short calls follow each other in rapid succession the horse soon becomes exhausted and merely ambles along.

If the motor cars were not limited by ordinance to a speed of fifteen miles per hour, a much better showing could be made, as the cars easily are capable of going thirty miles an hour, with full crew and equipment. The much greater radius of activity of the motor car also adds to its advantages. It sometimes happens that two urgent calls from widely separated sections

showed that during three days in May, 1909, by actual count 5,003 automobiles and 4,988 horse-drawn vehicles passed the observer. Similar tests during February this year showed the following proportions: Motor vehicles, 5,956; horse-drawn vehicles, 2,778—giving the power vehicles a majority of 400 more than two to one. In the cab service particularly the motor taxicab is making short work of the old-fashioned hansoms, as the figures for several tests made in 1908, 1909 and 1910 prove. On April 9th, 1908, the observer counted 160 taxicabs and 80 hansoms; on April 19th, 1909, the proportion was 179 to 57, and on February 21st, 1910, the hansoms were outnumbered by 298 to 29, or more than ten to one.

#### Taxicab Owners Sue Striking Drivers.

As a sequel to labor troubles which Chicago taximeter cab operators have been having with their chauffeurs during the last five or six weeks, three suits aggregating \$60,000 have been filed against the officers and members of the union. Action was brought in the Superior Court on Friday of last week, 6th inst., by the Walden W. Shaw Auto Livery Co., the Auto Taxicab Co., and the W. M. Trout Auto Livery Co., each asking damages to the extent of \$20,000 for alleged breach of contract. The defendants are the officers and members of the Auto Livery Chauffeurs' Union, No. 727, International Brotherhood of Teamsters.

It is charged that the members of the union violated their agreement with the employers when they declared a strike; their contracts being in effect until May 1 in two instances and until April 15 in the third. The case is being watched with interest, as it is the first to come up in the Cook county courts in which an attempt has been made to collect damages for violation of contract between employers and organized labor.

#### Total Wreck of a Fire Engine.

An automobile accident, in which a big brand new motor fire engine was completely demolished and three men were killed, occurred last Friday in Macon, Ga. The new automobile engine had been bought only the week before, and for the first time was driven by a member of the local fire department. The representative of the Webb Motor Fire Engine Co., who had delivered the machine and instructed the driver, was still in town when the accident happened. Going at high speed through a narrow street, the car grazed the curbstone, "sideswiped" one of the men against a telegraph pole, crushed his companion against a second pole, blew up both tires on the right hand side, skidded, and finally turned a somersault and fell on top of the remaining five men in the car, one of whom was killed outright. The driver was badly hurt and may die, while all the rest were painfully injured. The engine is a total loss.

EMERGENCY WAGON LEAVING STATION ON HURRY CALL

horse-drawn vehicles were in use, gave a total distance of 14.555 miles, which were covered in 103 minutes, making the average speed of the horse-drawn wagon 8.478 miles per hour. Taking twelve calls from the same district, where automobiles now are in use, and selecting, as far as possible, runs of the same nature as those chosen in the case of the horse-drawn vehicle, a total distance of 17.957 miles was covered in 72 minutes, or at an average speed of 14,064 miles per hour.

The best illustrations of the increased efficiency of the motor car over the horse-drawn vehicle, however, are supplied by the long distance calls. Before the installation of the automobiles, horse-drawn wagons would proceed for part of the distance at a high speed, but soon, owing to the horse becoming exhausted, the rate of travel would decrease and fall far below the average set up by the motor car, which travels at the same speed, no matter how far dis-

of Manhattan, but still included in the same "trouble" district, come simultaneously; in this case one of the automobiles of the other two districts must go beyond its own territory, sometimes as far as three and four miles. With the old horse-drawn wagons it was almost impossible to attend to such cases, and several costly conflagrations can be traced to the inability of workmen from the gas company to reach the scene of trouble promptly.

#### How the Horse is Being Retired.

The extraordinary advance of the automobile made especially in the large cities during the past two years is most clearly shown by a comparison of statistics giving the number of horses and horse-drawn vehicles in London, England. While there were 450,000 horses in London in 1900, there are now but 110,000. Special tests made at selected points within city limits, in no way preferred by touring automobiles,

## GLIDDEN SCOUTS NEARING CHICAGO

**Easy Sailing Follows Strenuous Mudplugging—Entry List is Extended—Seventeen Entries Already in Hand.**

After being delayed by heavy rains which rendered progress temporarily impossible, and was followed by a return to the old familiar occupations of mud bucking and bridge building in the early part of the week, the Glidden pathfinders now are again in the good roads belt and are making rapid progress towards their goal, Chicago. The daily runs practically are without incident, although longer, owing to the good

however, the pulling being done by a couple of electric cars. Although rendered well-nigh impassable after a heavy rain, the roads in the vicinity are said to be in fine shape in ordinary weather. After being in the clutches of a mudhole between Leavenworth and Atchison for four hours, the pathfinders finally reached the latter city at midnight, well soaked and very tired after their highly strenuous day.

Leaving Atchison late the following morning, the scouts continued their battle with the submerged roads, over which traffic had been suspended for three days, and pulled into St. Joseph that afternoon, after declaring that the stretch between Kansas City and St. Joseph was the worst that they had encountered so far on the entire trip.

good style and registered at Omaha that night, where they received a great welcome. The first accident of the trip occurred that day on entering Shenandoah, Ia., when Photographer Krohn was tossed out while the car was rounding a sharp turn. It was at first thought that his skull was fractured, but examination fortunately disproved this theory and he continued with the car. The 159 miles from Omaha to Des Moines, Ia., was traversed on Tuesday, 10th, in the official running time of ten hours. The car is expected to arrive in Chicago, the end of the tour, the latter part of this week.

Because of the unexpected length of time which has been required to map the route, the time for entering at the regular fee has been advanced from May 1 to 15. After

"SPYING OUT THE LAND" FROM ROADSIDE "WATCHTOWER"

TYPICAL APPROACH TO OKLAHOMA PRAIRIE TOWN

roads, and the escorts are virtually continuous.

Leaving Wichita, Kan., on the 4th, the pathfinders found excellent roads and made the longest day's run since the start—170 miles—stopping for the night at Ottawa, Kans. An escort of Wichita motorists accompanied the scouts as far as Emporia, where they were met by Kansas City brethren. Traversing the historic Santa Fe trail, the explorers on the 5th entered Missouri, the 10th state on the route, and completed the 64 miles between Ottawa and Kansas City.

With the rain falling in torrents, the pathfinders rolled out of Kansas City on the 6th, headed for St. Joseph, and, as might be expected, soon ran into difficulties. While plowing through mud and water up to the hubs, the Chalmers party came upon a bridge washout fifteen miles out, and a halt was made to consider ways and means of circumventing the elements. It was decided to recruit the farmers in the vicinity into a construction gang and, after a couple of hours' hard work, they constructed a bridge of railroad ties and stones over which the car was able to pass.

It was not long, however, before another difficulty presented itself near Leavenworth, where the flooded roads forced the scouts to take to the interurban tracks, and here they became stalled in the mire. Animal power was not called on for aid this time,

At St. Joseph the nose of the Chalmers was turned westward towards Omaha, and the logging of the newly added section of the

CROSSING AN OKLAHOMA FORD

tour commenced. The trail blazers enjoyed the hospitality of Marysville, Mo., on Sunday night, 8th, having had to stop and dig the sticky clay off the wheels several times.

With much improved roads on Monday the pathfinders boosted the odometer in

that date the additional fee of \$100 per entry, or \$300 in all will prevail.

It at first was thought the tourists could run from Dallas, Texas, direct to Oklahoma City, Okla., in one day, but the pathfinder reports that two days will be required for this distance, and another day must be added, making it impossible to reach Kansas City as at first planned for the second Sunday stop. From Dallas the run will be to Lawton, Okla., via Decatur, instead of Gainesville, Texas. Lawton will be the ninth night's stop, and the tenth day's run will be to Oklahoma City. This will bring the tourists to Wichita, Kans., for a day's rest on Sunday, June 26; and they will finish in Chicago Friday, July 1.

The official distance for the first half of the tour from Cincinnati, O., to Dallas, Tex., as recorded by the pathfinder's odometer is 1,253 miles, while the second half will be much longer on account of the addition of the Omaha section. Seventeen entries already have been made for the contest, of which 9 will compete for the Glidden trophy, 6 for the Chicago prize, and 2 non-contestants. The nominations are as follows: Glidden trophy—Premier Motor Mfg. Co., 2; Chalmers Motor Co., 3; Cole Motor Car Co., 1; Maxwell-Briscoe Motor Co., 2; Parry Auto Co., 1. Chicago trophy—Moline A. to Co., 3; Lexington Motor Car Co., 1; Cole Motor Car Co., 1; Parry Auto Co., 1.

## MOTOR TRUCKS FOR THE BUSINESS OF THE BREWER AND THE BUTCHER

HEAVY GASOLINE TRUCK DESIGNED FOR CASE GOODS

GENERAL ELECTRIC TRUCK USED SINCE 1903

GASOLINE STAKE TRUCK FOR HAULING CASKS

HEAVY CAR FOR BOTTLED DELIVERY

TRUCK USED IN WHOLESALE GROCERY TRADE

SOLID TIRES ON MEAT DELIVERY WAGON

**MOTOR TRUCK FOR TIRE HAULAGE**

**Ponderous Vehicle Employed by Hartford Company—The Use and Heavy Loads to which it is Subjected.**

Perhaps no sort of industrial enterprise is more strikingly in need of rapid and economical methods of primary transportation than is the automobile industry and its various tributary undertakings. This is so because of the extreme haste with which production operations are carried on, necessitating urgency in hurrying materials into the works as well as in expediting the removal of the finished product. Thus it fol-

The car is a 60 horsepower Mack gasoline truck, which is of special construction and weighs 9,800 pounds, or nearly five tons. It measures 21 feet over all, has a 14 foot wheel base and is 80 inches wide. Incidentally, the large panels on either side of the driver's seat offered ample space for advertising purposes—a consideration which is not without its advantages. The tire equipment, as a matter of course, is of the Hartford Solid Motor type, 36 by 6 inch single tires being used on the front wheels, 36 by 5 inch twins on the rear wheels.

Since being put into service, the truck has averaged no less than 112 miles per week, carrying approximately 247,880 pounds of merchandise, including materials and supplies ingoing and completed tires

MASSIVE TRUCK IN HARTFORD TIRE SERVICE

lows that automobile makers, parts makers and manufacturers of supplies and accessories rapidly are coming to use the commercial motor vehicle, not with the faithful object of "practicing what they preach," but out of thoroughly mercenary and appreciative motives.

A good instance in point is the huge motor truck which recently has been installed in the service of the Hartford Rubber Works Co., Hartford, Conn., and which is here depicted. Owing to its location, the freight stations and docks are a full three miles from the shipping and receiving platforms of the factory; which is to say that, other things being equal, the rate of production is directly measured by the promptness and reliability of the transportation system employed in feeding the works. Also it follows that an important item of waste or economy may be included in the production figures, according to the way in which this branch of the business is handled. Although motor vehicles have been employed before, it was deemed expedient to introduce new equipment, and for this purpose the vehicle shown in the picture was chosen.

outgoing. The usual day's work includes the transportation of some 30,000 pounds of outgoing freight alone, the machine easily making five round trips a day. When fully loaded it will hold 28 large wooden cases, each of which contains 15 automobile tires or 50 bicycle tires. The average useful load thus amounts to about three tons.

**Weak Mixture Due to Low Pressure.**

When the car habitually is run at moderate or high rates of speed, no ill effects are apt to manifest themselves as a result of leakage in the pressure line leading from the check valve to the fuel tank. If such leaks exist, however, they are apt to induce trouble when it is attempted to run the car for any length of time at slow speed. In such cases, the influx of gas into the tank will not be sufficiently rapid to correspond with the outflow of gasoline and the result will be that the engine suddenly will commence to draw a weak mixture in consequence of the deprivation of its fuel supply. On this account it is wise to cultivate the habit of watching the pressure gauge in order to make sure that the fuel supply is being maintained at its required rate.

**TEST OF PUSH-PEDAL STARTING**

**Royal Automobile Tries Out a System and Proves it Practicable—The Tests Applied and the Results.**

Although motor starting devices of the pedal actuated variety are by no means unknown, being used, indeed, on several makes of car on both sides of the water at the present time, the fact remains that not a few motorists are somewhat skeptical as to the real practicability of the system. In other words, although it is considered mechanically feasible, the foot-board substitute for the conventional starting crank commonly is regarded with a certain measure of distrust. Interest therefore attaches to a recent trial of a device of the sort which was carried out by the Royal Automobile Club of Great Britain, in which the system was completely vindicated, the starting of a medium sized motor equipment with magneto ignition alone being successfully accomplished under all the conditions prescribed by the test committee.

The starting system in use was of the push-pedal variety and so contrived that when not in use the pedal could be held flush with the foot board and therefore entirely out of the way. When released and brought into engagement, a single downward thrust of the pedal served to rotate the crank shaft through a sufficient angle to throw it over the usual compression interval and, under normal conditions, to secure the start. The car upon which the apparatus was installed was of 38 horsepower, furnished with Eisemann magneto ignition equipment but without batteries.

The first test was made to determine what degree of cylinder compression could be obtained merely by depressing the starting pedal through the length of its regular travel. Results noted by means of a pressure gauge showed, respectively, 39, 37, 30 and 32 pounds per square inch for the four cylinders. In each case, the figure given represents the maximum reading on the gauge inserted in the spark plug hole, and obtained while the pedal was being pushed down slowly to the limit of its travel. The remainder of the test was made under normal running conditions.

Within five seconds from the initial attempt, the engine started "cold," two strokes of the pedal being necessary to get it going. At the instant of starting, the temperature of the water in the radiator was noted as being 48 degrees Fahr. The machine was then operated in London traffic for 2 hours and 47 minutes, during which time nine stops were made; the restarting of the motor in each case being accomplished by means of the pedal. The greatest delay was one of nearly half an hour, after which the motor was started with two strokes of the

pedal. The greatest number of strokes required at any time was four, which followed an inadvertent stop when the motor had been throttled down too closely while running through congested traffic.

The complete record of the trip, showing the duration of the delays and the number of pedal impulses required to start the motor in each case follows:

Stop.	Duration required minutes to start.	Impulses
1 .....	25	3
2 .....	1	1
3 .....	1	1
4 .....	19	1
5 .....	1	1
6 .....	1	4
7 .....	2	1
8 .....	28½	2
9 .....	10	1

#### Unsuspected Causes of Back-Firing.

A relatively small particle of mud or even a small stone may be sufficient to cause the engine to back-fire when throttled down, if it happens to lodge between the auxiliary air valve of the carburetter and its seat when the car is running at high speed. Similarly, an accumulation of dust on the valve stem, if the latter is unduly lubricated, may have a similar effect, after the car has been run "wide open" for some distance. In either case, the difficulty is due to the weak mixture which results from the admission of an excess of air to the mixing chamber.

#### Usefulness of the Socket Wrench.

Socket wrenches of the sort which are provided with universally jointed shanks, are particularly useful in getting at the studs which hold the engine cylinders down upon the crank case. Without such a tool it frequently is well-nigh impossible to draw these members perfectly tight. Yet it goes without saying that it is very important that they shall be of uniform tension with the corresponding members on the same cylinder and that means be kept at hand to tighten them at any time when they may be found slack.

#### Mysterious Knocking of Loose Cylinder.

A loose cylinder may become the cause of a peculiar and rather mysterious knocking sound owing to the fact that it will tend to follow the motion of the piston and to slam down its bed every time the piston commences its downward stroke. Furthermore, such looseness, which may originate where the nuts which hold the cylinder in place are slightly loose, has a strong tendency to result in snapping off one of the studs sooner or later, which, in turn, may cause a pretty general smashup of the entire machine.

#### Tire Patch for Rim Cuts and Blowouts.

In providing accessories which will assist tire service and prevent many of the unnecessary cases of tire damage which can

be avoided by precaution, the tire companies themselves are even more active than outsiders, another instance of enterprise in this direction being afforded in the Goodyear rim cut patch, which the Goodyear Tire & Rubber Co., of Akron, O., has been offering. The patch, as indicated by the illustration, is fitted with a fabric flap which goes around the bead of the tire, repairing a rim cut both on the inside and the outside of the casing. Two plies of heavy

frictioned fabric form the body of the patch, with three-ply reinforcement between the two outer plies. The heavy reinforcement extends over almost the entire surface of the patch, and takes care of almost any blowouts from which the tire may be suffering. Three sizes are given, so that the device may be used on tires ranging from 2½ to 5 inches in diameter.

#### Lock that Controls Ignition System.

As a means for locking a car so that its engine can not be operated during the ab-

sence of the owner or authorized driver, a new Connecticut magneto switch fitted with a Yale lock has been brought out by the Connecticut Telephone & Electric Co., of Meriden, Conn. As indicated by the accompanying illustration, the lock is placed in such a position on the switch that it does not in any way disfigure the appearance of the latter. In addition to controlling the double ignition system so that when the lock is on neither the battery nor the magneto current can be employed for running the engine, the switch also has the usual removable or pull-out plug, which, when taken out, will stop the flow of ignition current

in the ordinary way. The pull-out plug is used for short stops, while the lock may be put into effect for such periods as when the car is in a garage over night or is left alone long enough to invite outsiders to tamper with it or to attempt to use it without permission. The locking of the ignition system, as provided for in the new Connecticut switch, does not prevent the car being moved about the garage floor, but renders it inoperative for road use.

#### Jericho Exhaust Horn for Small Cars.

For small cars another model has been added to the Jericho exhaust gas horns made by the Randall-Faichney Co., of Boston, Mass. The new model is known as No. 0, and sells at \$7, including brass pedal, attaching coupling, cable, cable clamps, pulley and fittings. To operate on a minimum exhaust from small engines, the length of the sound chamber opening has been shortened to some extent and the horn has been made a trifle narrower than the smallest of the other models, but the principle of operation, as previously developed, is exactly the same. To assist dealers and owners in attaching the Jericho horn to different cars, the company has issued a catalog or booklet, giving a complete list of American cars and some foreign machines, with information as to the size horn and the fittings required for each make and model. All the details are given for considerably over a hundred standard models.

#### Requirements for Brake Lining.

Lining materials for brakes present one serious requirement; in addition to furnishing the required frictional resistance and being able to withstand the pressure necessarily involved, they must be of such a nature as not to be affected by heat. With a wide range of materials to choose from, experience has proved the success of the woven asbestos fabric in many instances. Much depends upon the care, adjustment and use of the brakes, it is true, but even more upon the lining material which is used for them. These obvious truths and a number of useful suggestions in regard to the care and repair of brakes in general are set forth in a little pamphlet just issued by the H. W. Jones-Melville Co., New York City, which directs especial attention to the J-M No-Burn brake band lining, a product developed for this particular purpose.

#### "Latest Agony" in Automobile Finishes.

What is described as the "latest agony" in motor car finish has been developed at the factory of the Locomobile Company of America, Bridgeport, Conn., and apparently has found such favor as to warrant its being adopted for a large number of cars. The finish consists of a black body with white or very light striping and wheels finished in "natural wood," without paint or gloss varnish.

**WHAT TO DO IN CASE OF ACCIDENT****Further Exposition of Available First Aid Treatment—Dislocations, Sprains, Hemorrhages, Burns and Concussion.**

Although shock, contusions and wounds are frequently experienced in automobile accidents and a knowledge of the treatment of such cases greatly is to be desired, as detailed in last week's Motor World, they are not the only injuries within the ken of the motorist. Equally is it well to know the proper procedure in cases of concussion, hemorrhage and burns, despite the fact that these are of less common occurrence than sprains, dislocations and fractures.

A sprain is a common ailment and is generally apt to prove troublesome if not attended to immediately. Automobilists have been known to sprain a wrist or dislocate a shoulder while cranking an obstinate engine, and a case is known of one man who sprained an ankle because of too great eagerness and carelessness in mounting the driver's seat. Because he did not know how to reduce the swelling, and medical attendance was not at hand, a simple sprain developed complications and compelled him to use a crutch for the major part of a month. The old adage, "a stitch in time saves nine," is applicable.

**Dislocations.**

A dislocation or luxation is a forcible displacement of one articular (joint) surface of a bone from another, and may be the result of direct or indirect violence, or of muscular contraction. More or less rupture of the ligaments always takes place. The chief signs of dislocation are deformity and loss of function of the joint. The mobility of the part is greatly decreased, while in fractures there is increased mobility. In dislocation the deformity is at the joint, while in fractures it is usually about the shaft. The reduction of a dislocation requires considerable skill, and should be performed by the surgeon. Exceptions to this rule may be made in dislocation of the shoulder, lower jaw and fingers.

Dislocation of the humerus usually takes place downward. The reduction of this dislocation may be accomplished in the following way: A firmly compressed ball of cotton or similar material should be placed in the armpit; the attendant should then remove the shoe from his foot nearest the affected side of the patient (facing the latter) and press the heel upward against the ball which was placed in the armpit; he also should grasp the patient's hand and arm and pull downward, thus making extension and counter-extension. In this manner the head of the humerus is disengaged, and, if the foot of the attendant can be turned

outward and the arm of the patient brought toward the chest during the extension and counter-extension, the bone will generally slip back into its proper position. After the reduction the arm should be bandaged to the chest to prevent a redislocation. It should not be forgotten that the axillary space contains many nerves and blood-vessels, and too rough a manipulation may be followed by very serious consequences.

Dislocation of the inferior maxillar (lower jaw) may be the result of a blow, but usually follows the act of yawning, laughing or vomiting. The deformity is striking; the jaw is protruded and remains open, the patient being unable to bring the teeth together. The articular surfaces of the bone in this injury being carried forward, and somewhat upward, the reduction should be accomplished by depressing the articular portions of the lower jaw and forcing them backward. This may be accomplished in the following manner: The patient should be placed in a chair, with the operator standing before him, having his thumbs well padded to guard against the possibility of being bitten by the patient when the jaw snaps back to its proper position. The attendant then places a thumb upon each posterior molar tooth of the inferior maxillar, and presses downward and, with his fingers, tilts the chin upward. While the bone is being carried downward in this manner, a backward pressure with the thumbs should then be added to help carry the articular surfaces to their proper position. The jaw should then be held in place by a four-tailed bandage, which will be described later.

Dislocation of the phalanges may be reduced by bending the dislocated bone further back, at the same time making extension and counter-extension, then suddenly flexing the joint. The subsequent adjustment of a dorsal and plantar splint is necessary.

**Sprains.**

A sprain is a twisting or wrenching of a joint, associated with considerable stretching, and even tearing, of the tendons and ligaments of the affected part. Sprains usually occur at the ankle or wrist. Pronounced swelling and pain rapidly ensue, and are characteristic of the injury; though it is often difficult to decide between a sprain, a dislocation and a fracture. The proper relation of the ends of the bone composing the joint and the absence of the principal signs of dislocation and fracture indicate that a sprain exists. A sprain is always troublesome, and may be followed by serious results, a common sequel being ankylosis, or stiffness of the joint.

**Treatment of Sprains.**

The part should be elevated and a cold application made, preferably the rubber bag or a pig's bladder filled with ice. Should neither of these be obtainable, the cracked ice may be placed in a handkerchief or

towel, and, if possible, the dressing enveloped with oiled silk or rubber cloth. If the ice cannot be procured, cloths wrung out in cold water should be substituted. A roller-bandage, carefully applied from the extremity upward, is also valuable in preventing the continuation of the swelling. The ice or cold-water applications can be applied over the bandage; it must be borne in mind, however, that a bandage that has been wet will shrink, and may make too much pressure, or even cause strangulation of the part. After the acute symptoms have subsided, and the heat and swelling have diminished, the cold applications should be discontinued and gentle friction substituted. Or the joint may be rubbed with a stimulating lotion, as soap-liniment, alcohol, or salt water. Massage is also a valuable remedy. In severe sprains affecting the larger joints, these parts should be kept quiet for two or three weeks, and motion then be gradually performed.

**Hemorrhage.**

Hemorrhage is the escape of blood as the result of an injury to a blood vessel, and is classified as arterial, venous and capillary. In arterial hemorrhage the blood is thrown from the injured vessel in jets or spurts, and has a bright red or scarlet color. In venous hemorrhage the blood flows from the wound in a slow, steady stream, the color being dark red or purple. In capillary hemorrhage the blood oozes from the general surface of the wound and not from one point, as in either of the other two cases.

Hemorrhage is arrested in two ways—natural and artificial. The natural means of arresting an arterial hemorrhage is as follows: After an artery has been entirely divided the muscular coat produces a contraction and retraction of the vessel at the seat of the injury. The contraction diminishes the diameter of the artery, while the retraction draws the ends of the vessel backward into its sheath. The blood at the mouth of the injury forms a coagulum or clot, which aids in the prevention of a further escape of blood. The clot at the mouth of the injured vessel in time becomes organized and firmly attached, and permanently stops the bleeding. When an artery is only partly divided the contraction and retraction cannot properly take place and the hemorrhage is very persistent. The manner in which nature arrests venous hemorrhage is the same as in arterial, as above detailed, and also the collapse of the vessel at the point of injury. The pressure in veins being much less than in arteries, the hemorrhage is less vigorous and much more easily controlled. In capillary hemorrhage the small size of the vessels and the contraction which follows their division, together with rapid formation of a clot, especially when the bleeding surface is exposed to the air, usually check the bleeding in a very short time.

The artificial means of arresting hemorrhage are as follows: Position, pressure, cold and heat, torsion, rest, styptics, and ligation. Elevation of the injured part aids in controlling the bleeding only where a small artery has been severed, but is of little value when larger ones are implicated, owing to the strong pressure of blood in arteries.

The pressure method of arresting hemorrhage is, next to ligation, the most important means that can be employed for this purpose. It may be applied directly to the bleeding surface, or it may be made along the course of the artery. In the latter case the pressure should always be made between the heart and the wound. Pressure with the finger can only be of avail for a short time, unless the one making the pressure can be relieved at short intervals. For this reason a tampon—if properly applied—is more effective than digital pressure, provided the surgeon is not expected for some time, or in case it is necessary to move the patient.

In tamponing, the wound should be thoroughly filled from the bottom. A tampon improperly applied is worse than useless. The material used for this purpose must be absolutely clean, and, if possible, made antiseptic. Should the surroundings permit, choice should be made from the following: Small strips of antiseptic gauze, linen, muslin, or absorbent cotton. After the above has been complied with, the tampon should be held firmly in place by a bandage, but should not be allowed to remain longer than twelve or fifteen hours, without the advice of the surgeon. If, at the end of this time, no hemorrhage recurs, the wound should be treated as an ordinary wound.

If the surgeon is not expected for some time an improvised tourniquet may be used in the stopping of a severe hemorrhage. An excellent tourniquet can be extemporized by folding a large handkerchief in the form of a cravat, placing between the folds a smooth stone, piece of wood, cork, potato, etc., or a good sized knot may be tied in the handkerchief. The latter is not as good as the stone, etc., however. The handkerchief is then bound loosely around the limb and tied, the portion acting as a pad being placed over the artery, between the wound and the heart, and held securely in this position while a cane or stick of some sort is passed between the handkerchief and the skin, at the side of the limb opposite the pad. The cane or stick is then twisted until the bleeding is brought under control. As the constriction of this form of pressure interferes with the return of venous circulation, the handkerchief should occasionally be loosened, if there is any sign of serious obstruction, as swelling and discoloration of the part below the constriction. Digital pressure should be applied while the tourniquet is loose. A handkerchief is given as an example of what may at once be secured, but parts of clothing, neckties, suspenders

or rubber tubing, rope, inner tubes, etc., may be used.

Vehous hemorrhage is easily controlled if the following rules are observed: (1) Remove everything between the injury and the heart that retards the flow of blood, as garters, tight clothing, etc.; (2) elevate the part injured; (3) apply a good firm compress directly to the wound. Of course, it must be understood that elevation of the part and the use of the tourniquet can only be resorted to when the bleeding is from an extremity—the arms or legs—and would be of no use if the bleeding was from the body or head. In the latter case, a compress bandaged tightly over the wound would be the only and most effective method that could be employed.

In capillary hemorrhage there is little to be done. Exposing the part to the air, applying cold or heat in the form of ice or wet cloths is all that is necessary. It might be stated that hot applications (about 120 to 125 degrees Fahr.) are far more effective than the cold applications.

#### Burns.

Burns are divided into three classes—first, second and third degree. It will not be necessary to deal with third degree burns, however, as the only one which the automobilist may have to treat is that of the first degree. Burns of the first degree are those where there is nothing more than a little redness of the skin and a slight annoying pain. The second degree burn is where there is a blister caused by the heat. Among the soothing remedies which generally can be procured by the motorist at once are bicarbonate of soda, common baking—not washing—soda, starch, flour, chalk, magnesia or charcoal. One of these may be thickly dusted over the burned surface. Vaseline, cosmopine, lanoline, olive, linseed, or castor oil; also lard and butter, provided that they are not rancid; white lead paint, or limewater, whitewash, or even ink, mucilage, or molasses may be employed, although inferior to some of the others.

In burns of the second degree, if there is any dirt or clothing attached to the blisters it should be carefully washed away with warm water, or softened with oil, and detached later. If the blisters are large they should be pricked at their lowest point and the contents allowed to escape, or should be absorbed with a piece of clean blotting paper, etc. The oily substances recommended for first degree burns may then be applied. One of the best applications, and one which is most often prescribed by the surgeon, is equal parts of linseed oil and limewater.

#### Concussion of the Brain.

Concussion of the brain is a term applied to a shaking up or jarring of this organ. More or less contusion of the cerebral tissue probably occurs in severe cases. It is

caused by a blow upon the head, or a shock transmitted upward through the spinal column. The injured person may only be stunned or dizzy for a moment, with no loss of consciousness; the face is usually pale, and more or less weakness and trembling of the limbs are present. These symptoms are usually followed by a rapid restoration to the normal condition. Sometimes in apparently mild cases, however, serious cerebral disturbances may occur (usually within a week). In severe cases there is a partial stupor, and a feeble pulse; the pupils may be contracted or dilated, and generally react to light; the surface of the body is cold, and restlessness and vomiting are usually present. As a rule, the breathing is natural. In very severe cases the patient is in the condition of shock, which has already been described in a preceding chapter. There is one point connected with the shock following concussion of the brain which must be emphasized—namely, that the reaction is usually excessive, being more pronounced than in shock accompanying injuries to the body, and often results in inflammation of the brain.

#### Treatment of Concussion.

In mild cases the treatment consists in keeping the patient quiet, with cooling application to the head. The more serious cases, which assume the form of shock, should receive the treatment appropriate to the latter condition, particular attention being paid to the extreme reaction that may occur. For this reason internal stimulants should not be given. Warmth to the extremities, and cold applied to the head, are also indicated. Rest and quietude must be insisted upon in all cases of concussion of the brain.

#### Compression of the Brain.

Compression of the brain commonly follows fracture of the skull, a portion of the broken bone being driven into the cerebral tissue and causing pressure. A cerebral hemorrhage may also cause this condition. It often is difficult to decide between concussion and compression of the brain. However, in compression the stupor is more profound, the pulse is slow, the pupils are dilated and do not respond to the action of light; the breathing is stertorous, similar to that in apoplexy. There is more or less paralysis present, and convulsions may occur.

#### Treatment of Compression.

Besides keeping the patient quiet and applying cold to the head, and preventing the administration of stimulants, very little can be accomplished by the unprofessional person, and the case should be placed in the hands of a surgeon as quickly as possible. If a wound is present it should be protected by an antiseptic compress, which can be held in place very effectively by a four-tailed bandage.

THE NEW  
**Rambler**

New Rambler Fifty-Four Toy Tonneau without  
Spare Wheel and Wind Shield, \$2250.

*Expert workmen  
gauging Rambler  
parts for accuracy.*

Quality in an automobile, and the final satisfaction obtained from its use, depends not only upon the quality of the materials and design, but more than anything else upon the accuracy with which the parts are made and fitted. The first workman is examining a transmission gear, gauging it for accuracy. The second is making sure that the position of the propeller shaft, squared for the sliding gears, is exactly centered to the main shaft.

## VARIATION OF THE BLOCK MOTOR

How it is Effected in Pullman Car and the Benefits Obtained—Three Chassis Afford Ten Models.

Whatever advantages may be claimed for the method of casting automobile engines in block form, there is this much to be said to its disadvantage, that in the event of the failure of one or more of the cylinders, or, indeed, the failure of any portion of the entire casting, it must be discarded or repaired at considerable expense. A decidedly ingenious method of securing many of the advantages which

for the difference in the method of assembling the cylinders, they are very much alike. Taking the three chassis as a basis, however, a full line of no less than ten distinct models is produced merely by the introduction of variations in body construction.

In respect to differences between these and the preceding models, relatively few changes have been made as far as mechanical methods of construction are concerned. Increased length of wheel base, longer and more easy riding springs, dropped frames and the adoption of longer strokes for the engines are alterations which practically summarize the differences involved.

To be more specific, the 35 horsepower motor now has a bore of  $4\frac{1}{2}$  and stroke of  $4\frac{3}{4}$  inches, the 50 horsepower a bore and

Control of the gears is obtained on the right side in each case. But on the smallest chassis the actuation is secured by means of a straight quadrant, instead of by the grid-iron segment which is used on the other two models. Final drive, which is by shaft, is obtained through a double jointed shaft on the 35 and 50 horsepower sizes, tubular torsion rods attached by means of ball and socket joints to a spring housing which is hinged to the center cross frame member. On the 30 horsepower car the tubular shaft and torsion member combined is employed, and therefore the shaft is provided with but a single cardan joint. The tubular housing member is hinged at its forward end to the cross frame center member, thus affording the necessary flexibility.

RIGHT SIDE SHOWING PECULIAR CYLINDER FORMATION

obtain in the case of the block motor is that of flanging the faces of neighboring cylinders, coring out large open ports at the sides, and then bolting them together in the form of a single unit.

This is a characteristic method with the Pullman Motor Car Co., of York, Pa., which has made it a permanent feature of the cars which bear the same name. In former years the cylinders have been cast individually and made up in the way indicated into the quadruple units which form the standard power plant. In one of the three models now current, however, a slightly different plan has been adopted. The cylinders are cast in pairs; but each of the two two-cylinder groups is cast with one end open, flanged and faced, and the two groups are bolted together as in the case of the four single cylinders.

The model upon which this change has been brought about is known as "O-10." The other two models which complete the line of chassis at present being produced are designated as "K-10" and "M-10." The horsepower ratings of the three models taken in this order are 30, 35 and 50. Save

stroke of  $5\frac{1}{4}$  by 6 inches, while the 30 horsepower engine, which is in reality a newcomer insofar as size is concerned, has cylinder dimensions of 4-1-32 by 5 inches.

Water circulation is maintained by means of gear driven centrifugal pumps on each of the models, the capacity being uniformly such that eight gallons of water will be delivered per minute with the engine turning at the rate of 900 revolutions per minute. On the 35 and 50 horsepower models, the radiators used are of the cellular type. On the 30 horsepower car the tubular type is employed. Double ignition is used on the 35 and 50 horsepower chassis, with Bosch high tension magneto and distributor and coil. The distributor is located between and above the rear cylinders and is driven from the cam shaft by means of helical gears.

Transmissions are of the sliding gear type on all models; on the 30 and 35 horsepower models they are of the three-speed pattern, while the largest chassis of the three is fitted with a "geared-up" fourth speed, which is to say that the direct driving arrangement is obtained on third speed.

MAGNETO AND PUMP MOUNTING ON PULLMAN ENGINE

All three models are mounted on Timken axles, the rear equipment in each case being of the full floating type. The "M-10" and "K-10" models carry the adjustable roller bearing type of mounting, while the "O-10" car is equipped with annular ball bearings. The combined area of effective braking surface on each of the models is over 500 square inches. The standard equipment is of the double pattern with newly developed equalizing bars. The spring mounting is of the semi-elliptical pattern insofar as the front suspensions of all three models is concerned; on the "K-10" model the same system is used in the rear, but on the other two three-quarter elliptic rear springs are employed.

Body equipment in the case of the 35 horsepower model is made optional between touring, small tonneau and roadster forms. In the case of the 50 horsepower chassis, the equipment may be either touring or small tonneau. The 30 horsepower size may be obtained with small tonneau or roadster mounting, according to the desire of the purchaser. Enclosed bodies are made to fit either the 35 or 50 horsepower chassis.

## RECENT PATENTS.

953,429. Drive Chain. Frank L. Morse, Ithaca, N. Y., assignor to Morse Chain Co., Ithaca, N. Y., a corporation of New York. Filed June 27, 1908. Serial No. 440,734.

1. A drive chain having links composed of a plurality of plates provided with apertures at their ends, three part pintles extending through said apertures and comprising two side parts or bushings and a central cylindrical pin normally free to turn upon one of the bushings, and means for restraining said central pin from making a free and complete rotary movement.

953,512. Tire Grip. Eugene E. Burns, Hartley, Iowa. Filed Dec. 4, 1909. Serial No. 531,474.

A tire grip comprising side chains, and cross chain members therebetween, each of said members comprising one piece of chain connected at its opposite ends to the side chains, and another piece connected at one end to one side chain and at the other end to said piece between its ends, and beyond the middle point thereof, whereby both pieces will contact with the ground at the middle line of the tire tread.

953,658. Adjustable Anti-Skid Device. Don E. J. Brackett, Cleveland, Ohio. Filed June 28, 1909. Serial No. 504,732.

1. An anti-skid device consisting of a retaining member and a flexible gripping member, the latter adapted to extend across the tread of a tire and with its ends removably attached to the retaining member, said retaining member consisting of a pair of clamp members each bearing a loop and arranged on opposite sides of a wheel-spoke, a clamping bolt and a locking bolt pivoted to one of said members and extending through the other of said members, and means co-operating with said bolts for locking said members to a vehicle-spoke.

953,673. Grip Tread for Tires. Harry D. Weed, Syracuse, N. Y. Filed Sept. 3, 1907. Serial No. 391,178.

1. In combination with a chain tire grip embodying cross chains, and side members to which the ends of the cross chains are connected, a take-up attachment surrounding the hug and embodying both flexible-yielding parts and flexible-unyielding parts connected together, and some of said parts being connected with one of the side members of the chain grip.

953,704. Reversing Gearing. Frank E. Paine, Jr., Detroit, Mich., assignor by mesne assignments, to Packard Motor Car Co., Detroit, Mich., a corporation of Michigan. Filed Oct. 1, 1907. Serial No. 395,386.

1. In a reversing driving mechanism, the combination with a dish-shaped bed or frame having a transverse partition therein and having bearings at its ends on opposite sides of said partition, of driving and driven shafts respectively supported in said bearings, reversing coupling mechanism mounted on said shafts between the partition and one end of said frame, and a rock shaft arranged to operate said coupling mechanism, said rock shaft being mounted in the lower part of the frame on the opposite side of the partition from said coupling mechanism.

953,750. Vehicle Spring. Ralph W. Morse, Lansing, Mich. Filed Jan. 27, 1908. Serial No. 412,924.

The combination with the frame of a vehicle, of a bracket depending from the

frame, a compound flat spring, a block inserted between the members of the spring and secured to the latter, a pivotal connection between the block and bracket, means for connecting one end of both members of the spring to an axle of the vehicle, a link pivotally connected to the vehicle frame, an auxiliary link pivoted to the lower member of the spring, and a pivotal connection between the respective links, the upper spring being connected to said links at the point of connection therebetween.

953,762. Indicator. Henry A. Raedeker, Melrose Park, Ill. Filed Sept. 2, 1909. Serial No. 515,873.

An indicator comprising a metallic body portion provided with a hinged lid having outer and inner flanges at the front edge thereof; similar outer and inner flanges on the front edges of the ends and bottom of said body portion; colored glass secured between said flanges; an opaque plate also secured between said flanges; vertical brackets secured to the sides of said body portion; and a reflector adapted to be secured in said brackets, the relations being such that said reflector must be flexed to enter said brackets, substantially as described.

953,804. Adjustable Wind Screen for Use on Vehicles. Charles Steane, Coventry, England. Filed Dec. 22, 1908. Serial No. 468,823.

1. In a wind screen the combination of a stationary member, an adjustable screen member hinged to the stationary member, a quadrant having openings therein carried by the hinged screen member at one side thereof, and adapted to turn therewith, a spring-pressed detent slidably arranged on the stationary member and adapted to engage within the openings in the quadrant, an operating wire for the detent secured thereto, and a pedal to which the wire is connected.

953,831. Safety Device for Cranking Explosive Engines. Charles W. Hillenbrand, Kansas City, Kans., assignor to Nathaniel C. Barnes, Kansas City, Mo. Filed Aug. 12, 1909. Serial No. 512,582.

1. In a device of the character described, the combination with an engine shaft having an extension adapted to be uncoupled therefrom, a bearing in which said extension is journaled, resilient means interposed between said bearing and the extension whereby it may be coupled to the shaft, a sleeve through which said extension may slide but is caused to turn therewith, a crank loosely mounted upon said sleeve, yielding means for locking the shaft and said crank together so that the latter may turn the former forward, a stationary ratchet-wheel loosely mounted upon the sleeve, and a pawl carried by the crank and engaging the ratchet-wheel to prevent the crank from turning backward.

953,873. Metal Tire Shield. Arthur J. Walker, Hooker, Okla. Filed July 28, 1909. Serial No. 510,040.

A tire shield composed of sections, each section consisting of spaced metallic plates, a cushioning strip interposed therebetween, and plates and strip having registering slots, a link arranged within each set of registering slots, said link consisting of a flat metal strip having lapping ends, and means for securing the ends together, a chain extending from each of said links, alternate links of the chain being made up of flat strips of metal having lapping ends secured together, and a hooked rim engaging member formed of a flat metal strip having a looped end engaging one of the links of each chain and

said looped portion being secured against opening.

953,916. Vehicle Wheel. Edward F. Maybaum, New York, N. Y. Filed Sept. 4, 1908. Serial No. 451,741.

1. In a vehicle wheel, the combination of a rim, a hub, hollow spoke bodies rigid thereon, spring controlled spokes radially movable in said spoke bodies and connected at their outer ends to said rim, and rollers on said spokes adapted to bear against the walls of said spoke bodies to limit the deflection of said spokes, substantially as described.

953,990. Ignition Apparatus. Ernest Eise-mann, Stuttgart, Germany. Filed Dec. 17, 1907. Serial No. 406,873.

In an ignition apparatus, the combination of a distributing disk, a part forming a support for said disk, a toothed member meshing with said ring, another part forming a support for said member, and high-tension and low-tension contacts arranged on the opposite faces of said disk, substantially as described.

953,992. Transmission Gearing. William Folberth, Cleveland, Ohio. Filed July 12, 1906. Serial No. 325,882.

1. The combination of a driving shaft, a driven shaft, a shaft intermediate said driving and driven shafts, a clutch for connecting the intermediate shaft with the driving shaft, a gear casing mounted to rotate about the axis of the intermediate shaft and provided with an internal gear and with a clutch member, a pinion mounted on the intermediate shaft within said casing, a twin gear supported to rotate about the axis of the intermediate shaft and having one member meshing with said pinion on the intermediate shaft and with the aforesaid internal gear, a gear mounted on the driven shaft and adapted to engage alternately either the other member of said twin gear or the aforesaid clutch member of the gear casing, means for holding said gear casing stationary, and independent means for preventing rotation of the twin gear relative to the intermediate shaft.

954,095. Engine. Fred L. Gregory, Chicago, Ill., assignor to Foley-Gregory Engine Co., Chicago, Ill., a corporation of Illinois. Filed Sept. 25, 1908. Serial No. 454,675.

1. In an engine, the combination of four cylinders arranged to form a rectangle, said cylinders being in pairs with the members of each pair having opposed open ends, pistons in said cylinders, a rock-shaft actuated by said pistons, valve-chambers located on the same side of the plane of said cylinders, admission and exhaust valves connected therewith, and a cam-shaft located between said valve-chambers and serving to actuate said valves.

954,130. Automobile Sled. William C. Niemann, Waltz, Mich. Filed June 11, 1909. Serial No. 501,582.

1. In a sleigh, a body, a rear bob fixedly secured thereto, a front bob pivotally mounted on the body, a yoke pivoted to each of said bobs to swing in a vertical plane, an arm projecting from one of said yokes provided with an apertured end, a second arm extending from the other yoke provided with an end having a horizontally arcuate slot, and a pin passing through said apertured end and arcuate slot.

954,144. Automobile Wheel. Thomas J. Sparks, San Francisco, Cal., assignor, by di-

rest and mesne assignments, of one-half to Uncle Sam Automobile Co., Phoenix, Ariz., a corporation of Arizona, and one-half to Edward C. Ray, San Francisco, Cal. Filed May 13, 1907, Serial No. 373,246. Renewed April 12, 1909. Serial No. 489,524.

In a wheel, the combination of a tire, a felly, spokes, a hub consisting of a flanged tubular member having threads on one end and being pyramidal from the threaded portion to the flange, said flange having its surface toward the threaded end conical, a flat ring having a series of depressions on each side of the same set at a phase difference of one half, and a flange having a part of its interior threaded and adapted to screw on the end of the tubular member and the remainder of its interior polygonal.

954,224. Vehicle Tire. Benjamin C. Swinehart, Akron, O. Filed Dec. 7, 1908. Serial No. 466,341.

A vehicle tire comprising the combination with a rim having the sides thereof intumed to provide clenchers, and a body of elastic material mounted in the rim and formed with a tread and a base having a circumferentially extending groove in its inner face to separate the base into two sections, a series of combined spreading and holding wires embedded in and extending transversely of each of the sections of the base, said wires of such a length as to extend from the wall of the groove to beyond the lateral face of the base at the opposite side when the body is detached from the rim, the wires of one series oppositely disposed with respect to the wires of the other series whereby when said body is mounted in the rim, the wires will laterally spread the sections

to wedge within and frictionally engage the clenchers of the rim, and the wires permanently bear against the inner faces of the clenchers to prevent creeping of said body.

954,228. Universal Joint. Theodore F. Timby, Alma, Mich. Filed Jan. 17, 1910. Serial No. 538,397.

1. The combination, in a universal joint, of a ball member constructed with a circumferential groove in one plane coincident with its axis of rotation, a fork member having a concave grooved face, and an interposed concavo-convex member constructed with an internal rib fitted to the groove of the ball member and an external rib arranged at right angles to said internal rib and fitted to the groove of said fork member.

954,286. Transmission Gearing. William W. Henderson, Washington, D. C. Filed Jan. 26, 1909. Serial No. 474,260.

1. The combination of a clutch member, a shaft, shiftable change speed gearing operatively connecting the clutch member and the shaft, additional means to connect the clutch member and the gearing, said means being connected or disconnected by shifting the gearing, and means to shift the gearing to connect or disconnect said additional means.

954,333. Tire Tread. Denis T. O'Sullivan, West Orange, N. J. Filed Sept. 12, 1908. Serial No. 452,694.

A tire having a sheath encircling the tire and substantially covering the outer portions thereof, said sheath having oppositely placed eyes before the spokes of the wheels and oppositely placed eyes behind the

spokes of the wheels, and a flexible band forming loops connecting said pairs of eyes and forming a loop around the spokes.

954,362. Tire Armor. Wallace W. Tompkins, Newburgh, N. Y. Filed March 27, 1909. Serial No. 486,200.

A pneumatic tire comprising an inner tube and an outer tube adapted to surround the same, a strip of canvas overlying and co-extensive with the tread of such outer tube, and a series of overlapping, resilient armor plates superposed upon said canvas strip and permanently secured by means of rivets passing through the plates, strip, and outer tube, the rivets through each plate being arranged along one edge in a row transverse to the length of the tire, the other edge being free and arranged to overlap the riveted edge of the next plate, the free edge of each plate being bent or flared upwardly out of its own plane at its middle portion, to provide transverse ridges adapted to bite into the surface of the roadway.

954,375. Demountable Rim. Eli J. Bushey, New York, N. Y. Filed April 19, 1909. Serial No. 490,659.

1. A wheel having a felly, a band surrounding the felly, a rim for carrying the tire, a split clamping ring interposed between the said band and the said rim, means for fastening the said clamping ring to the said felly at points approximately opposite the free ends of the ring, a lug carried by the rim and extending through the ring and band into engagement with the felly, and manually controlled means for spreading the said clamping ring.

954,400. Gear Casing. Randall A. Palmer, Detroit, Mich. Assignor to Cartercar Co.,

# =Pierce-Racine=

The secret of the popularity of the Pierce-Racine is its capacity for economical, efficient service under the most trying conditions.

This is due primarily to its *splendid* motor. Other things help, of course, such as the tires, wheels, axles, frame, transmission and steering mechanism, all of which are of a superior quality.

But it's the motor that after all makes or mars the performance of a car. Motorists are coming to a greater realization of this every day. Agents who handle the Pierce-Racine,

## THE CAR WITH A FAMOUS ENGINE

**\$1750**

are reaping the benefit. Let us tell you more about this. A postal will bring our literature. There is food for thought in it for every prospective purchaser and dealer. Write to-day.

Geo. W. Root, San Francisco.

Pontiac, Mich., a corporation of Michigan. Filed Nov. 14, 1908. Serial No. 462,610.

In a gear casing, the combination of an upper concaved member provided with a flanged edge and having inspection and lubricating apertures through its top portion, a complementary casing member similarly flanged for registry with said upper member, whereby holding bolts may be passed through them, and there being transverse apertures in the walls of the shell thus constituted for the passage of rotatable shafts therethrough and for permitting their rotation and possible wavering from their initial axial positions without engaging against the adjacent edges of the shell members, a supplemental casing section lying parallel with and spaced from the portions of the shells immediately surrounding one of said apertured portions, dust excluding washers adapted to engage closely about and to be supported by such shafts and to extend between the main casing walls and the adjacent supplemental casing to prevent the undesired entry of foreign matter, and a bottom closure member for said last mentioned casing, adapted to be removably secured thereto, whereby its concaved portion and the adjacent portions of its supporting casing are formed as a liquid containing basin at the bottom of the entire casing, substantially as described.

954,416. Demountable Rim for Automobile Tires. William N. Booth, Cleveland, O. Filed April 12, 1909. Serial No. 489,482.

1. In combination, a fixed rim, a demountable rim adapted to fit closely thereon, said parts having inclined engaging sur-

faces, a pair of lugs on said demountable rim, a worm and wheel locking device intermediate between said pair of lugs and mounted in said fixed rim, and adapted and arranged to engage said pair of lugs to force said demountable rim on and off from said fixed rim.

954,424. Attachment for Repair Tools. Winfield L. Dinsmore, Longbeach, Cal., assignor to Economy Tool Co., Los Angeles, Cal. Filed Oct. 24, 1908. Serial No. 459,335.

1. A portable vulcanizing tool comprising a plate having a vulcanizing face at one side and a face at the opposite side accessible for clamping the plate to the part to be vulcanized, said plate provided with a gas or vapor burner arranged to heat the vulcanizing face, and a handle extending outwardly from the edge of the plate between the two faces, having a gas supply passage leading to the burner.

954,387. Support for Automobile Lamps and Number Plates. Harry J. Gernet, Philadelphia, Pa., assignor of one-half to Edward F. Gorman, Philadelphia, Pa. Filed Oct. 16, 1909. Serial No. 522,958.

In a support for automobile lamps and number plates, the combination of a base piece having a plurality of uprights and a lamp rod arranged in parallel relation to one another; a plate carrier secured to said uprights, said plate, carrier, comprising grooves and flanges at its edges adapted to receive and retain a number plate; means for clamping a number plate against said carrier; and a rearwardly projecting sup-

port adapted to be mounted upon the cross bar of an automobile chassis, substantially as set forth.

## VEILS THE MEETING IN MYSTERY

Promoter of "Independent" Association  
Holds a Session in His Office—De-  
clines to Talk of Proceedings.

If the Association of Motor Car Manufacturers elected officers or otherwise perfected organization at its meeting in Detroit on Monday last, Henry C. Walters, the lawyer who appears to be engineering its affairs, is not anxious that the names of the officers or members or any information be made public.

The meeting was held in his office in the Ford Building, but Mr. Walters threw a veil of mystery around it and declined to say anything whatsoever regarding its proceedings. A Motor World man who kept his eyes open was unable to discover that any of the manufacturers known to be or likely to be interested in the organization went into or out of Mr. Walters's office, which made it appear that if they were represented at all it was by counsel and not in person.

The association, as exclusively stated in the Motor World of May 5, is the result of an invitation to other independent manufacturers extended by eight of the nine Michigan makers against whom suits for infringement of the Selden patent recently were instituted. At a meeting held in Detroit on the 2d inst., which Mr. Walters stated was attended by 40 manufacturers, the title Association of Motor Car Manufacturers was adopted, and May 16th was set as the date for the election of officers. Mr. Walters's efforts to enshroud the movement in mystery are therefore not easy to comprehend and can only serve to set afloat rumors that may not be readily overtaken or counteracted.

### Hayes and Willys in a Body Company.

With H. J. Hayes, of Detroit, Mich., as its president, and John N. Willys, of the Willys-Overland Co., Toledo, O., on the directorate, the Hayes-Ionia Auto Body Co.,

of Ionia, Mich., has completed its organization, following the incorporation of the company with \$150,000 capital stock, of which \$80,000 is preferred and \$70,000 common. The company has bought the plant and property of the Ionia Wagon Works from the receiver for \$70,000 and is remodeling the plant, with a view to delivering 1,000 bodies per month after the first of July, working in harmony with the Hayes Mfg. Co. in Detroit. In addition to Hayes as president, the officers chosen are T. B. Preston, vice-president; W. Q. Loomis, secretary; W. B. Heath, treasurer. The directors are F. W. Green, W. B. Heath, T. B. Preston and W. J. Loomis, of Ionia; H. J. Hayes and H. H. Smith, Detroit, and J. N. Willys, Toledo.

### Ewing Organizes a New Company.

L. E. Ewing, of Cleveland, O., who has been identified with motor cab design, is one of the moving spirits in a new automobile manufacturing company in Findlay, O. Having obtained a factory building from the Findlay Axe & Tool Co., the concern has incorporated with \$300,000 capital and will be known as the Findlay Motor Car Co. The incorporators include A. L. Welch, M. C. Mulball, Roy H. Hunter, J. C. Brooks and S. Gilfether.

### Storms in a Sandusky Parts Project.

The Sandusky Auto Parts & Truck Co., of Sandusky, O., has organized with \$150,000 capital stock and is preparing to commence operations in that city. Daniel E. Storms, former secretary of state of Indiana, is one of the moving spirits.

### Henry Out of the Henry Company.

Dave W. Henry has retired as general manager of the Henry Motor Car Co., of Muskegon, Mich., of which he was the organizer. His future plans have not yet been disclosed.

### Goodyear Opens a Baltimore Branch.

The Goodyear Tire & Rubber Co. has opened a branch in Baltimore, Md., at 533 North Howard street. George T. Howard is the manager.

## LICENSED FORCES NOW SUE VELIE

Bring Infringement Proceedings in Latter's  
Own Circuit—Motions Filed for Dis-  
missal of Milwaukee Suit.

In addition to being the aggressor in its \$500,000 suit in Milwaukee against the members of the Association of Licensed Automobile Manufacturers, the Velie Motor Vehicle Co., of Moline, Ill., now is made a defendant in litigation with the Licensed forces, as suit has been brought against it in the United States Court at Peoria, Ill., by the Columbia Motor Car Co. and George B. Selden for infringement of the Selden patent. The suit is of the same nature as those recently brought against a group of unlicensed Michigan manufacturers, and was filed by Rector, Hibb & Davis, attorneys, of Chicago.

Motions to dismiss the suit which the Velie company brought in Milwaukee some weeks ago have been filed by 26 of the defendant companies in the Licensed Association. These defendants maintain that their principal places of business are outside the judicial district in which the suit was brought. It is claimed that the service of summons and complaint in the suit, which was made on their Milwaukee agents, was improper, and that service of this kind should be made on the defendants themselves in order to be valid. The motions, which are bunched as one group, will be argued before Judge Turner on the 21st inst.

The point raised in this connection is one which has been before the courts many times before for adjudication as to whether the "agent" in the ordinary commercial sense can accept service for the manufacturer whose goods he handles. It generally has been shown that serving an "agent" is not the same as serving the manufacturer, because the former's agency relation with the manufacturer is very limited and does not empower him to act for the manufacturer as a principal in litigation.

## RUMPUS OVER REVERE PURCHASE

Minority Disapproves of U. S. Rubber Directors' "Rake-Off"—Tires May Advance—Why Rubber Must Fall.

At least one company has found it advisable to make announcement of the probability of a further raise on its tire prices, in consequence of the continued high price of rubber, and it is to be expected that several of the tire makers soon may advance prices at retail and in cases where no contracts or "understandings" are in effect. In fact, the tire companies are extremely vigilant in seeing that the increased cost of crude rubber does not adversely affect their net earnings, and conclusive evidence is provided in the annual report of the United States Rubber Co., just issued, that high prices for rubber need not decrease the profits of those for whom it is the raw material of their products.

Informing and enlightening as is the report itself, the annual meeting for which it was prepared and which took place on Tuesday, 17th inst., was considerably more lively, as it was the occasion for quite a rumpus among the stockholders over the purchase of the Revere Rubber Co., of Revere, Mass., a few months ago. The money for the purchase of the Revere Rubber Co. stock was advanced by a syndicate in which several of the directors of the United States Rubber Co. were prominent. The deal was ratified by the directors of the United States company, but at the meeting, which was attended by about 50 stockholders, including two women, the minority interests questioned the transaction.

As compensation for advancing the money for the purchase, the syndicate, which included President Colt, is to receive the profits for two years from operations of the purchased company, up to \$700,000. This item, together with the accretion in market value of the securities underwritten, brings a total profit of 14¼ per cent. to the syndicate, according to the minority's figuring. President Colt said that the money had to be raised quickly for the purchase of the Revere company, and that there was no excessive profit for the syndicate, the profits of the Revere company for the last two years having been only about \$580,000. The majority steam roller came through the meeting in good order, with the adoption of resolutions approving the acts of the officers and directors for the past year.

John J. Watson, Jr., president of the Rubber Goods Mfg. Co. and treasurer of the United States Rubber Co., resigned these offices and severed all connections with the United States company and its subsidiary concerns, in practically all of which he was an officer and director. He would give no explanation of his resignation, nor would his associates comment on

it, but it was generally assumed in Wall street that the direct cause was disagreement with President Colt, although not directly in relation to the Revere Rubber deal. Elisha S. Williams, of the Revere company, was elected to succeed him as treasurer of the United States Rubber Co., while James Deshler, former superintendent of the Revere factory, was made a director with Williams.

In the annual report of the United States Rubber Co. for the year ending March 31, President Colt indicates that it is the most favorable the company has issued since its organization. Through its tire making subsidiary concerns, the Rubber Goods Mfg. and the Revere companies, the parent company expects a great growth in its automobile tire business, and preparations and equipment have been provided with this end in view. Rubber prices are certain to return to normal figures, he indicates, as production overtakes consumption, it being pointed out in the report that this process now is taking place.

"With almost unlimited forests of native rubber trees in Brazil and other countries," says President Colt, "and an almost unlimited area in the Far East upon which rubber trees can be successfully cultivated, it would seem that rubber cannot be maintained indefinitely at a price from three to ten times the cost of production."

### Will Make Motor Parts in Hastings.

The Hastings Motor Shaft Co., of Hastings, Mich., which has been incorporated with \$50,000 to manufacture automobile parts and specialties, has elected its officers and started work on a factory. The officers are Arthur E. Mulholland, president; John F. Goodyear, secretary; William W. Potter, R. B. Somers, D. S. Goodyear and George Wright, directors.

### Pope Buys Auburn Auto Pump.

Arthur W. Pope, of Boston, Mass., together with some Hub associates, has acquired the Auburn Auto Pump Co., of Auburn, N. Y., the transfer including property, patents, good will and stock. The Auburn plant was started two years ago by F. E. Ten Eyck, and has been making a power pump for tires, which attaches to the engine of the car.

### Dowagiac's Equipment Goes to Oklahoma.

The Tulsa Automobile & Manufacturing Co., which recently was organized in Tulsa, Okla., has acquired the property and equipment of the Dowagiac Motor Co., of Dowagiac, Mich. The manufacturing equipment and stock will be moved to the factory at Tulsa.

### Superior Files Plans for Big Plant.

The Superior Motor Vehicle Co., of Buffalo, N. Y., has filed plans with the building bureau for a one and two story brick factory at 1686 Elmwood avenue. The plans call for an expenditure of \$81,000.

## TAKES BRUSH, BRISCOE AND GRAY

United States Motor Completes the Transfer of Its Two Detroit Constituents—Adds a Motor Plant.

In accordance with the program previously indicated, the United States Motor Co. has taken over the Brush Runabout Co. and the Briscoe Mfg. Co., of Detroit, Mich., and also has acquired the Gray Motor Co., of the same city, the latter making marine and stationary gasoline motors.

As a result of the transfer of the Brush company to the merger corporation, the holders of Brush preferred stock get an even exchange for preferred stock in the United States Motor Co., but the interest is increased from 6 per cent. to 7 per cent. Holders of the common stock get 2½ for 1 in the exchange. Frank Briscoe, a brother of Benjamin Briscoe and president of both the Brush Runabout Co. and the Briscoe Mfg. Co., has been made a director in the United States Motor Co.

The enlargements planned for the Brush factory provide for a capacity of 20,000 runabouts for 1911, while the capacity of the Briscoe company is to be increased to a point where it can take care of the requirements of all the constituent companies in the merger, in regard to radiators, fenders, hoods and similar fittings. The Gray Motor Co., which has a capacity of 15,000 motors per year, is to have a new factory for the manufacture of marine motors, and when this is completed the present factory will be used for automobile motors. O. J. Mulford will continue as president and general manager, but the other members of the company will retire.

### Los Angeles Licensed Dealers Elect.

The annual election of the Licensed Automobile Dealers' Association, of Los Angeles, Cal., has resulted in the choosing of Earle C. Anthony, manager of the Western Motor Car Co., as president, succeeding Ralph Hamlin, who has been made a director. The other officers and directors elected include Don Lee, of the Lee Motor Car Co., vice-president; P. H. Greer, of the Greer Robbins Co., treasurer, and A. M. Young, of Birely & Young, secretary, together with William Bush, of the Pierce-Arrow agency, and P. A. Lord, of the Lord Motor Car Co.

### Gloomy Outlook for Watt Creditors.

Creditors of the bankrupt Watt Motor Co., of Detroit, Mich., are not elated by the outlook which is presented as a result of the investigation by the Detroit Trust Co., the receiver. The liabilities have been found to be about \$20,000, while the assets are represented as "problematical," consisting largely of machinery bought on contract and not yet fully paid for.

## THREATS TO CANCEL CONTRACT

**They Meet with an Unexpectedly Cordial Welcome—Amusing Incident that Throws Light on Tire Situation.**

In the serious affairs of the automobile industry there are many humors, which are developed spontaneously from the conditions surrounding the conduct of more heavy matters. An instance of the kind is afforded in a momentary clash between an assistant purchasing agent of one of the big automobile factories and an officer of the tire company supplying it with tires, incidentally revealing the frame of mind with which the tire companies regard the contracts which they made before the present difficult rubber situation arose, but which are still in effect and compel them to supply tires at the old price.

Upon discovering that the tire company no longer supplied some non-essential lugs with the tires, the vigilant assistant purchasing agent, with more enterprise than discretion, took the matter up with the tire company and claimed an allowance for his concern. He was told that no such allowance would be made. Pressing the demand still further, he threatened that if the allowance were not made his company would cancel the tire contract and would buy its tires elsewhere.

"If you will send that cancellation at once I'll consider it a favor," said the officer of the tire company, "and will present you with a box of the finest cigars money can buy."

This jolt gave its recipient a quick thought on the big difference between the contract price and the present price of tires. No steps have been taken toward the cancellation of the contract, at last reports.

### Light Wagons Coming from Owosso.

The Owosso Motor Co., of Owosso, Mich., with \$200,000 capital, has been organized to make light delivery wagons, the manufacturing operations for the present to be conducted in a wing of the plant of the Owosso Carriage & Sleigh Co. The car, which was evolved by C. V. Richardson, until recently with Reliance Motor Truck Co., is to sell for \$1,750 and is to be of about 1,500 pounds capacity. The officers are: W. E. Hall, president; Dr. J. O. Parker, vice-president; Dr. P. S. Willson, secretary; F. W. Pearce, treasurer; C. V. Richardson, general superintendent. These, with E. N. Thomas, compose the board of directors.

### New Directors for General Motors.

At a meeting of the board of directors of the General Motors Co., held in New York on the 12th inst., five new members of the board were elected, as follows: W.

C. Leland, Detroit; A. M. Bently, Owosso, Mich.; R. S. McLaughlin, Oshawa, Ont.; Edwin R. Campbell, Flint, Mich., and Schuyler B. Knox, New York City. Leland is general manager of the Cadillac Motor Car Co.; Bently is general manager of the Rapid Motor Vehicle Co., and McLaughlin is general manager of the McLaughlin Motor Car Co., Ltd., the General Motors enterprise in Canada. The other members of the board include William M. Eaton, New York; W. C. Durant, Flint, Mich.; William J. Mead, Lansing, Mich.; Curtis R. Hatheway, New York; John T. Smith, New York, and Henry Henderson, Scotch Plains, N. J.

### Spacke Will Stick to Parts Production.

The F. W. Spacke Machine Co., of Indianapolis, Ind., has let it be known that it is not going into the manufacture of complete cars. Reports that it was about to do so appear to have originated in the fact that the company, in addition to producing its regular line of parts, has been doing some special work for a concern that is intending to manufacture automobiles, when the latter company is under way; however, the Spacke company will do no more than supply the motor, steering gear and transmission requirements. "The parts business is good enough for us," the company avers significantly.

### Schrader Treasurer Dies Suddenly.

Albert G. Starke, secretary and treasurer of A. Schrader's Son, Inc., New York City, died at his residence, on Thursday, 12th inst., after a short illness. He was thirty-three years old and was born in Germany, having come to this country as a boy. By reason of the fact that the Schrader company manufactures tire valves, he was quite widely known to the cycle and automobile trade, being highly regarded by all with whom he came in contact.

### Havers Gets a Port Huron Plant.

The Havers Motor Car Co. is the most recent automobile manufacturing project for Port Huron, Mich. The company has taken possession of plant No. 3 of the Port Huron Engine & Thresher Co., and is to build a six cylinder roadster, designed by Ernest Havers, of Detroit, Mich., and which is to sell for \$1,200.

### McCullough to Handle Accessories.

The McCullough Motor Supply Co. has been formed in Indianapolis, Ind., to handle automobile parts and accessories. Its president and treasurer is L. McCullough, formerly sales manager for the Cole Motor Car Co., of Indianapolis.

### Tragic Death of a Chicago Manufacturer.

John A. Ryerson, president of the Ideal Electric Co., of Chicago, Ill., was killed on Monday night, 16th inst., by jumping or falling from the thirteenth floor of the Chamber of Commerce building. The Ideal company makes electric vehicles.

## INSTALMENT MAN DISAPPEARS

**Following the Motor World's Exposure he Decamps—"Forgets" to Pay His Rent and to Return Deposits.**

In indicating that its "main offices and show rooms are located in the great Hudson Terminal Buildings, the gateway between New Jersey and New York City," the Terminal Auto Co. concludes its printed matter with the statement: "You can't miss us!" Nevertheless, there are those who do—because "the company" has flown.

Only a grease spot remains where for a few brief weeks the company had his plush roped stand, his exhibition car, his desk and his nerve. What has become of the car, the desk and the plush ropes is not known, but it is probable that the company, who is known in private life as Guernsey Stevenson, still has his nerve with him, wherever he may be. In fact, it appears to have been one of his most valuable assets, and it would be a blow indeed if he should lose it, although the publicity he already has received in the Motor World is said to have impaired it to some extent.

Meanwhile various confiding souls who gave him \$100 or more as deposits on cars bought on the instalment plan have the privilege of coming around and looking at the grease spot, which is composed of drippings from the second-hand car which adorned his space. In this doubtful recompense they are joined by various creditors for advertising and the like, while the Hudson Terminal Building management holds the grease spot as its security for his unpaid back rent, although it would like to have something more tangible.

Things began to become very warm for Stevenson last week, after the Motor World's second probing into his methods, and they soon reached such a stage that he found it convenient in person to disappear, leaving his belongings in the stand. A day or two later he sent an expressman for them, and was sufficiently lucky to have his written request honored for their delivery to the expressman before the fiscal agent of the building knew what was being done or could attach either the furniture or the car as security for the unpaid rent. The expressman left no message as to the Terminal Auto Co.'s new address.

Stevenson has been stopping at the Hotel Churchill, at Broadway and Fourteenth street, but that hostelry knows him no more, and he left no forwarding address. In fact, the hotel has a bunch of mail matter for him, and does not know where to send it.

A committee of creditors and victims of the instalment plan lure is being formed. Its objects, lacking the hope of actual financial recovery, are more or less vengeful in their nature.

## THE WEEK'S INCORPORATIONS.

Lancaster, Pa.—Lancaster Auto Co., under Pennsylvania laws, with \$50,000 capital.

Detroit, Mich.—Swift Automobile Co., an Arizona corporation, admitted to do business in Michigan.

Milwaukee, Wis.—Studebaker Automobile Co., an Indiana corporation, admitted to do business in Wisconsin. Wisconsin interest, \$3,500.

Cleveland, O.—Cleveland Automobile Spring Co., under Ohio laws, with \$20,000 capital. Corporators—C. G. Hull, E. W. Farr and others.

Meriden, Conn.—Blue Ribbon Garage, under Connecticut laws, with \$50,000 capital. Corporators—Hubert J. Ashley, W. H. Samuel, Nelson B. Marr.

Whitewater, Wis.—Weyher Mfg. Co., changes name to Whitewater Mfg. Co., increases capital from \$35,000 to \$50,000 and takes up manufacture of motor cars.

Indianapolis, Ind.—Regal Auto Sales Co., under Indiana laws, with \$10,000 capital; to deal in automobiles. Corporators—C. R. Lambert, C. C. Rundell, Mae Rundell.

Buffalo, N. Y.—Clark Motor Co., under New York laws, with \$50,000 capital; to deal in automobiles. Corporators—Stanley B. De Long, J. W. Van Allen, H. J. Rente.

Ionia, Mich.—Hayes-Ionia Co., under Michigan laws, with \$150,000 capital; to make automobile bodies. Corporators—H. J. Hayes, T. B. Preston, W. J. Loomis.

Martinsville, Ind.—Martinsville Auto Co., under Indiana laws, with \$10,000 capital; to deal in automobiles. Corporators—K. J. Nutter, W. E. Clark, Blanche M. Nutter.

Cleveland, O.—Acetylene Accessories Co., under Ohio laws, with \$10,000 capital. Corporators—T. L. Hopkins, A. C. Streich, E. L. Davis, B. W. Brockett, W. C. Griffiths.

Chicago, Ill.—Lloyd Auto Garage Co., under Illinois laws, with \$5,000 capital; to do general garage business. Corporators—W. L. Rudd, Guy H. Lloyd, George W. Ford.

Maury, Tenn.—Fry Bros. Motor Co., under Tennessee laws, with \$5,000 capital; to do general automobile business. Corporators—W. H. Dale, H. Rainey and others.

Abbeville, La.—Ritter Co., under Louisiana laws, with \$10,000 capital; to deal in automobiles and operate a garage. Corporators—F. A. Godchaux, J. McWhann, J. F. Ritter.

Louisville, Ky.—Cold Air Regenerative Motor Car Co., under Kentucky laws, with \$20,000 capital; to manufacture automobiles. Corporators—J. F. French, W. F. Dawson and others.

Nazareth, Pa.—Neverslip Puncture-Proof Tire Co., under Delaware laws, with \$20,000; to manufacture automobile tires under letters patent. Corporators—H. S. Shafer,

H. S. Shafer, Jr., Fred Wonderly, all of Nazareth, Pa.

Wissahickon, N. Y.—Wissahickon Automobile Co., under New York laws, with \$25,000 capital; to deal in automobiles. Corporators—A. K. Taylor, W. H. Taylor, H. G. Eastburn.

Milwaukee, Wis.—Wisconsin Automobile Radiator Co., under Wisconsin laws, with \$50,000 capital; to manufacture radiators. Corporators—G. Aussem, S. S. Landt, Arthur Zancig.

Chicago, Ill.—Benz Motor Co., under Illinois laws, with \$2,500 capital; to deal in automobiles and accessories. Corporators—Emil C. Wetten, Charles H. Pegler and Charles V. Clark.

Chicago, Ill.—Wilcox Motor Car Co., under Illinois laws, with \$12,000 capital; to manufacture motors and motor vehicles. Corporators—A. L. Ballas, F. J. Wegg, George J. Meier.

Chicago, Ill.—Mack Motor Truck Co., under Illinois laws, with \$10,000 capital; to do automobile delivery and taxicab business. Corporators—M. B. Pittman, Gilbert Noxon, R. W. Cavanaugh.

Newark, N. J.—United Auto Co., under New Jersey laws, with \$100,000 capital; to manufacture and deal in automobiles. Corporators—Samuel H. Levy, Joseph Sonnabend, Ph. J. Schotland.

Findlay, Ohio.—Findlay Motor Car Co., under Ohio laws, with \$300,000 capital; to manufacture automobiles. Corporators—A. L. Welch, M. C. Mulhall, R. H. Hunter, J. C. Brooks, S. Giffether.

New Brunswick, N. J.—Williamson Garage Co., under New Jersey laws, with \$50,000 capital; to do general garage business. Corporators—W. M. Williamson, N. H. Smith, P. K. Buckalow.

Toledo, Ohio.—Dusseau Motor Car Co., under Ohio laws, with \$30,000 capital; to manufacture automobiles. Corporators—S. V. Dusseau, W. G. Dusseau, A. J. Marleau, F. X. Dusseau, R. Dusseau.

Buffalo, N. Y.—Regal Auto Co., under New York laws, with \$10,000 capital; to deal in automobiles. Corporators—W. W. Porter, Jr., C. E. Hancock, M. S. Melvin, R. G. Boyd, H. D. Van Brunt.

Chicago, Ill.—Auto-Renewal Co., under Illinois laws, with \$2,500 capital; to do general automobile, garage and repair shop business. Corporators—James S. McClellan, Leo Klein, Jerome J. Cermak.

Chicago, Ill.—Graham Differential Gear Co., under Illinois laws, with \$50,000 capital; to manufacture automobiles, accessories and machinery. Corporators—Percival Steele, J. T. Tyrell, G. J. Jeffries.

Detroit, Mich.—Robinson Motor Car Construction Co., under Michigan laws, with \$20,000 capital; to manufacture automobiles, parts and accessories. Corporators—M. M. Robinson, C. C. Currie, Wm. Elsey.

Chicago, Ill.—Chicago Auto Clock Co., under Illinois laws, with \$50,000 capital; to manufacture automobile clocks and accessories. Corporators—Adolph L. Benner, William M. Lawton, Otto G. Knecht.

St. Louis, Mo.—St. Louis-Overland Co., under Missouri laws, with \$20,000 capital; to deal in gasoline and electric automobiles. Corporators—E. W. Lee, W. R. Gentry, T. M. Dines, Jerome Harrington and others.

Philadelphia, Pa.—Philadelphia Observation Automobile Co., under New Jersey laws, with \$15,000 capital; to deal in, operate and let on hire sight-seeing automobiles. Corporators—F. R. Hansell, J. A. McPeak, W. T. Eidell.

Glens Falls, N. Y.—Glens Falls-Bolton Auto Stage Line, under New York laws, with \$5,000 capital; to operate automobiles in and about Glens Falls. Corporators—F. D. Miller, J. E. Miller and A. M. Miller, all of Glens Falls.

Jersey City, N. J.—Scherl Monorail Co., under New Jersey laws, with \$125,000 capital; to manufacture automobiles, monorail cars, etc. Corporators—W. O'Shea and J. W. Hertzler, New York City, and Thomas A. Renwick, Jersey City.

Far Rockaway, N. Y.—Pearsall-Traver Mfg. Co., under New York laws, with \$50,000 capital; to manufacture and sell non-skid device for automobiles and deal in accessories. Corporators—L. Pearsall, P. C. Traver, T. S. Remsen, J. C. Titell.

## Changes Among Prominent Tradesmen.

John Ryan, formerly with the Factory Sales Corporation, has joined the forces of A. R. Mosler & Co., New York City. He will push the sales end for Mosler carburetors, his previous experience having been particularly in the carburetor selling field.

John F. Bible, ex-Mayor of Ionia, Mich., and formerly manager of the Ionia Wagon Works has taken the sales management of the Ideal Auto Lighter Co., of Jackson, Mich. For this purpose he has organized the Bible-LaSalle Co., which is to market the output.

D. D. Rowlands has resigned as an assistant chief engineer of the Chalmers Motor Co., of Detroit, Mich., to become chief mechanical engineer of the Rider-Lewis Motor Car Co., of Anderson, Ind. He formerly was connected with the engineering departments of T. B. Jeffery & Co. and the Pierce Motor Co., respectively.

W. T. Helfer, formerly the Boston manager for the Diamond Rubber Co., but who has been with the Springfield Metal Body Co., of Springfield, Mass., for the last three years, has resigned from the latter concern to accept a position and interest with the Racine Mfg. Co., of Racine, Wis. The Racine company is rebuilding its plant, recently destroyed by fire, and is preparing to manufacture bodies on a big production basis.

## IN THE RETAIL WORLD.

The Columbus Auto & Electric Co., Columbus, Miss., has suffered a fire loss of \$3,000. Several complete cars were damaged beyond repair.

The Appleton Garage & Automobile Co. has been organized in Appleton, Wis. A brick garage, 50x150 feet, is to be built on Washington street.

The Van Da Grief Co. has opened a brick garage at Broadway and Seventh street, Louisville, Ky. It will be devoted chiefly to motor trucks.

John H. Bledsoe and L. J. Ritchey have opened a garage and salesroom at Garrison avenue and Olive street. Henry cars will form the "stock in trade."

The Riverdale Motor Car Co. is the style of a new concern which has opened up in Dayton, Ohio. Its garage is located at 719-721 North Main street.

H. T. D. Wilson and Thos. E. O'Neil have opened a garage and salesroom in Houston, Tex., under the style The Auto Co. The firm will specialize the Stearns cars.

Frank L. Hardsty is erecting a new garage, factory and warehouse for automobiles on Loockerman street, Dover, Del. The building will be of brick, 40x50 feet.

The Borgeding Motor Car Co. is the style of a new concern which has opened up a garage and salesroom on Main street, New Albany, Ind. Regal cars will be featured.

Thomas B. Jeffery & Co., makers of the Rambler automobiles, have established a branch in Rochester, N. Y., at 745-749 Park avenue. Fred R. Luescher is its manager.

The Monroe Bridge Garage Co. is building a new garage at Monroe avenue and Pacific street, Rochester, N. Y. It will be three stories high and cost about \$40,000.

Ground has been broken for the new garage of the Leland Hardware Co., at Leland, Miss. The building is to be one story, 80x140 feet, and will be ready by July 15th.

The Williams Automobile Co., of Los Angeles, has been established in its headquarters at the corner of Twelfth and Main streets. Moon, Petrel and Schacht cars are shown.

The "Crack-A-Jack" Automobile Tire Repair Shop just has been opened at 702 First avenue, Minneapolis, Minn. The two "crack-a-jacks" in charge are E. J. Walsh and C. K. Tousley.

A. Meister & Sons have been appointed agents for the Standard Motor Co., in San Francisco, Cal. The full line of Kelly delivery wagons and trucks made by the Standard Co. is to be shown.

A. D. Harmon, manager of the Nebraska Motor Car Co., has opened an agency and display room on Denver avenue, Hastings, Neb. He is handling the Parry and Warren-Detroit automobiles.

Collister & Sayle, who have been hand-

ling automobiles and supplies for the past ten years in Cleveland, Ohio, have opened a branch in that city at 1920 Euclid avenue. H. S. Dewitt is in charge.

Wilmington, Del., is to be the home of the recently organized Delaware Automobile Co., with salesrooms and garage on Washington street, near Fourth. Apperson automobiles will be the chief stock in trade.

H. G. Hanks, a hotel owner of Carson, Ia., has leased an entire block on Perry street, on which he will build an up-to-date garage and repair shop. Automobile livery will be run in connection with the garage.

The Taylor-Prior Co., Eau Clair, Wis., has commenced the erection of a garage on South Barstow street, the building to be constructed of cement blocks. Stevens-Duryea cars will be exhibited by the company.

Robert B. Currie, dealer in automobile supplies under the trade style of the Currie Supply Co., at No. 912 Sixth avenue, New York City, has made an assignment to Alex. H. Hamilton. He began business in October last.

The Gate City Auto Co., of Fargo, N. D., has bought the establishment formerly occupied by the Feckler Bros. automobile house and opened a garage therein. The company handles the Buick, Oakland and Oldsmobile.

Kankakee, Ill., is to have still another garage on Dearborn avenue, the Kankakee Motor Car Co. having contracted for a building, 55x100 feet, of pressed brick with glass front. Howard Mann is the manager of the concern.

Homer Livingston, a merchant of Danville, Ill., has branched out into the automobile business. He has converted part of his big store at 16 North Hazel street into a salesroom and garage, where he will show the Henry "35."

The Metropolitan Motor Car Co., of Spokane, Wash., has taken possession of its new garage and salesrooms at 1318 Second avenue. Harry Bell is the manager of the concern, which handles the Pullman, Premier and Lozier cars.

J. C. Leavitt, formerly of Kansas City, has purchased William Johnston's half-interest in the Johnston Motor Sales Co., Denver, Colo., and will handle the business affairs of the company. Tobin continues in charge of the sales end of the business.

North Adams, Mass., is to have another large garage "in its midst." Fernando L. Rand is building it on Ashland street, and it will cover 5,000 square feet and house thirty cars with ease. He expects to have the work finished by the end of this week.

The Vernon Motor Car Co., Fort Worth, Tex., and E. F. Simmons, state agent for the Stevens-Duryea, have consolidated under the style the Vernon-Simmons Motor Car Co. Their line of cars includes the Oakland, Oldsmobile, Hupmobile, Everett "30" and the Stevens-Duryea.

The Haynes Auto Sales Co., of San Francisco, has established branch houses in Sacramento, Cal., and Stockton, Cal. Robert Rathborn will manage the Sacramento house, and George Hammond, who has been with the Pierce-Arrow Co. for six years, will take charge in Stockton.

The Palace Automobile Station, Hartford, Conn., is enlarging its present garage to more than double its size; the 40x125 feet of seven years ago have grown to 25,034 square feet on one floor without a post. The building will be fireproof throughout. A complete repair shop will occupy the rear of the building. The improvements will cost \$80,000.

Baltimore, Md., is to have another high-class modern garage covering three city lots, at 408, 410 and 412 North Calvert street. Each of the lots has a frontage of 45 feet and a depth of 110 feet. Richard M. Shaffer, the purchaser of the property, who at present is in the automobile business at 408 North Calvert street, has already commenced the remodeling of the adjoining buildings.

## Philadelphia Dealers Organize.

The Philadelphia Licensed Automobile Dealers' Association has completed its permanent organization and has arranged for incorporation. The officers elected are J. A. Wister, of the Elmore Co., president; E. B. Jackson, of the Packard company, vice-president; W. J. Foss, Pierce-Arrow, secretary-treasurer. The officers, acting as ex-officio with A. E. Maltby, Winton, and W. C. Longstreth, Pullman, constitute the board of governors.

## New Factory for Hudson Cars.

The Hudson Motor Car Co., of Detroit, Mich., has started work on its new \$500,000 factory on Jefferson avenue. The main building is to be 580 feet long and will have two wings, each 300 feet long, in addition to which there will be a testing building, shipping sheds, power house, dining hall and office building. The plant is to be ready by fall.

## Ross Buys Badger Rubber Works.

The Badger Rubber Works plant, at Mineral Point, Wis., has been acquired by L. A. Ross, R. C. White and G. A. Graham, who will operate it as the Ross Rubber Mfg. Co. The company is to make automobile tires as soon as the necessary equipment can be installed, and also will manufacture a general line of rubber goods.

## Vickers Completes His First Car.

The Vickers Auto Car Co., of Coshoc-ton, O., has completed its first car, which will be called the Vickers. The machine is a runabout with a four cylinder, two-cycle, air cooled engine. Carl Vickers, proprietor of Vickers Repair Shop, backed by E. H. McMasters, of Bellaire, O., is at the head of the enterprise.

# White Steam and Gasoline Cars for 1911

Having disposed of our 1910 product, we now announce our steam and gasoline models for 1911.

Full details regarding the new models, dates of delivery, etc., may be obtained on application to any of the offices or agencies of the company.

#### Perplexities of the Garageman.

No one can begin to appreciate the number of minor and troublesome perplexities which confront the garageman who is in the position of catering to a growing business with only limited facilities at hand—that is, no one can except the garageman who is in the position of catering to a growing business with only limited facilities at hand. And it may be said that that is just the position in which a large proportion of the garage proprietors to-day find themselves. No matter from what angle the problem is viewed, certain elements of uncertainty and confusion are bound to appear; whether in the guise of the finicky and dissatisfied customer or in the form of purely mechanical difficulties which baffle adjustment because of the peculiar existing conditions.

As an example, the problem of car storage may be instanced. As long as there is ample floor space and not too many cus-

tomers to look after there may not be much difficulty about it. But just as soon as the cars begin to be crowded will arise some owner of a small car who objects because some other man, who owns a larger car, is permitted to have a position a little nearer the door and to retain it at all times; or someone whose car has come in late over night will raise a rumpus because his machine has been moved in order to let out another which was behind it. Then there are the man who always wants to supervise the moving of his own machine on and off the wash rack; the fellow who always wants to run his machine into the middle of the floor and start fixing it, and the boor who by reason of a real or fancied "pull" continually is endeavoring to "work" the establishment for unusual privileges of one sort or another.

One of the simplest problems of all, yet one which is pretty apt to give trouble sooner or later in the new garage, is that of storage space. Relatively speaking, only a few establishments are arranged in a suitable way when it comes to taking care of the cars, and invariably after all the choice spaces have been spoken for there must be a few dissatisfied latecomers. But it is noteworthy that a good deal of trouble may be avoided if, in the very beginning, the entire storage space is laid off by means of division lines painted on the floor and designated by number either painted on the floor or on the wall behind each space. In some localities, where there is plenty of room, a few individual storage spaces may be walled off, with shelving or locker space in each compartment, and a little higher rental obtained for the exclusive and theft-proof advantages of the arrangement. In most cases, however, it is sufficient to indicate exactly how many cars may be placed on a floor and to keep definite record of the proper location of each and every machine. It is a simple protection for the interests of both proprietor and customer, and besides saving misunderstandings, affords an absolute measure of the capacity of the establishment and tends to prevent overcrowding.

#### The Equipment of Commercials.

In the development of the commercial vehicle a perfectly legitimate tendency is that of eliminating all unnecessary accessories. But it is a not unreasonable conclusion that in not a few instances this principle has been carried further than condi-

tions warrant. Certainly this would seem to be true with regard to the installation of certain indicating and regulating devices such as in pleasure car practice have come to be considered almost indispensable.

For example, certain makers of electric delivery wagons are in the habit of sending them out shorn of the volt and ammeters which alone furnish an indication of the amount of energy which the battery contains and also of the rate of consumption under any given condition of load or highway. Speed indicators may be supposed to be unnecessary in most instances, but there are cases, like that of the light delivery wagon, when to carry a device of this sort might enable the operator to follow a better time schedule on his route or even to avoid breaking the speed ordinances when otherwise he might offend through sheer ignorance.

An even more important class of instrument, however, is the speed and distance register of the recording pattern, such as the market affords in several thoroughly practical types, and which is really necessary where close figuring of schedules, loads and costs is to be maintained. It is of the greatest importance to the commercial vehicle operator to know exactly what movements his rolling stock makes in the course of a day, and to be able to check up his expenses in connection with an accurate and automatic record of this phase of its work.

At present, the adoption and installation of equipment of the sort in question is left almost entirely to the option of the purchaser. At the same time, it should be borne in mind that in very many cases the purchaser is largely ignorant of the requirements, and that he may not appreciate their importance sufficiently to be eager to go to the extra expense of installing them, even supposing that they happen to be called to his attention. Such being the case, it would seem a not unwise proceeding for the commercial vehicle manufacturer to take it upon himself to catalog such devices and to press every opportunity of mounting them on his product.

It is not unlikely that within a few years market rivalry will force the movement exactly as it has forced the adoption of liberal equipments in the case of so many pleasure vehicles. Therefore it would be of considerable advantage to take the lead in calling the attention of the buyer directly to such extra facilities as will enable

him to check up the performance of his vehicles and in urging him to adopt every sort of economic and labor-saving device which is suitable to the purpose.

#### **Rush Work and its Consequences.**

Rush work evils are well known and equally to be deplored by the manufacturer who is forced to resort to overtime. Only from the lips of the press agent are the words "night work" spoken with unfeigned complacency. Hurry-up jobs invariably smack of quantitative, rather than qualitative, results, no matter what means are taken to safeguard the work and supervise the workman. Owing to its peculiar nature, the automobile industry is particularly subject to this sort of industrial handicap, nor does it appear that many of the makers who are fairly launched in business are likely to be able for some time to come entirely to eliminate it. Even where production facilities are adequate for all ordinary undertakings, delayed deliveries of materials, belated orders, labor troubles and like exigencies are bound occasionally to cause the works to remain open after dark, and the payroll to mount up in geometrical progression.

One particularly trying element of the rush work problem is that introduced by the special order. A buyer takes a fancy to a certain style of body and fain would have it on his new car. Rather than have the work go to a local carriage maker and make sale of the chassis alone, the manufacturer undertakes the order. Unfortunately, however, like most buyers, this particular customer must have his car by a certain date, probably only a little later than the specified time of stock deliveries. Unless the manufacturer happens to be well equipped to handle non-routine work, such an order is apt to prove more or less embarrassing. It involves the unspoken requirements of execution which the custom order invariably presupposes; it breaks into factory system to some extent, and, in the pressure of short time allowance, it not infrequently is apt to turn out unsatisfactorily.

Once a fine limousine belonging to a New York politician was burned to the ground suddenly and mysteriously. Subsequent investigation placed the blame where it usually rests in the case of fires in office buildings. "Crossed wires" actually were responsible in this case, however, for it was said that the body was a special job,

## **COMING EVENTS**

May 19-21, Hartford, Conn.—Automobile Club of Hartford's All-Connecticut reliability contest; 600 miles.

May 22, Fort Worth, Tex.—Fort Worth "Star-Telegram" endurance run.

May 22, Memphis, Tenn.—Automobile races at Tri-State fair grounds.

May 22-23, Brooklyn, N. Y.—Crescent Athletic Club-Long Island Automobile Club amateur touring contest on Long Island for Pardington trophy.

May 25, Columbus, O.—Columbus Automobile Club's reliability run to Indianapolis, Ind.

May 27, 28 and 30, Indianapolis, Ind.—Grand Circuit meeting and national championship races on Motor Speedway.

May 27-31, Washington, D. C.—Washington "Post" five days endurance run to Richmond, Va., and return.

May 28, White Plains, N. Y.—Amateur Automobile Contest Association's hillclimb.

May 28 and 30, Kansas City, Mo.—Automobile Club of Kansas City's two days' race meet at Elm Ridge track.

May 28-31, Syracuse, N. Y.—Central New York inter-club relay run.

May 29-30, San Francisco, Cal.—San Francisco Motor Club's two days race meet at Tanforan.

May 30, Oklahoma City, Okla.—Oklahoma Automobile Association's reliability contest.

May 30, Bridgeport, Conn.—Bridgeport Automobile Dealers' Association's hillclimb on Snake hill, Fairfield.

May 30, Denver, Colo.—Denver Motor Club's road race.

May 30, Briarcliff Manor, N. Y.—Amateur Automobile Contest Association's hillclimb.

May 30, Denver, Colo.—Denver Motor Club's annual road race.

June 1, Berlin, Germany.—Start of Prince Henry tour, finishing at Homburg on 8th.

June 2, New York City.—Annual Orphan's Day outing at Coney Island.

June 3-4, Buffalo, N. Y.—Automobile races at Fort Erie track.

June 4, Worcester, Mass.—Automobile Club of Worcester's annual hillclimb on Dead Horse hill.

June 4, Philadelphia, Pa.—Quaker City Motor Club's race meet at Point Breeze track.

June 6, Atlanta, Ga.—Start of second annual New York-Atlanta Good Roads Tour, ending in New York June 14.

June 7, West Haven, Conn.—Yale Automobile Club's third annual hill-climb on Shingle hill.

June 11, St. Louis, Mo.—Automobile Club of St. Louis reliability contest.

June 11, Newark, N. J.—New Jersey Automobile and Motor Club's 280 miles reliability run.

June 11, Portland, Ore.—Portland Automobile Club's annual road race for Wemme Cup.

June 11, Wilkes-Barre, Pa.—Wilkes-Barre Automobile Club's annual hill climb on Giant's Despair.

June 15-30.—American Automobile Association's seventh annual national touring and reliability contest for the Glidden trophy, starting from Cincinnati and finishing at Chicago.

June 16-22, Albany, N. Y.—Albany Automobile Club's sixth annual tour to Atlantic City, N. J., and return.

June 25, Port Jefferson, N. Y.—Automobile Club of Port Jefferson's hillclimb on East Broadway hill.

July 2, Wildwood, N. J.—North Wildwood Automobile Club's roadability run from Philadelphia to Wildwood.

July 4, Wildwood, N. J.—North Wildwood Automobile Club's annual beach race meet on Ocean Drive.

July 4, Indianapolis, Ind.—Chicago Automobile Club's second annual race for the Cobe trophy on Motor Speedway.

which had been put together on short notice. In wiring the interior for electric lights defective insulation had resulted, probably from hasty work, and the first indication of trouble came when the top actually began to blaze.

Less serious consequences usually result where special rush work is carried out hastily, but the moral is not always so obvious. Such manufacturers as are able to count on a considerable amount of business of this class, as a rule, are able to provide for it and are wise if invariably they stipulate sufficient time to make sure that the work will be well done. Others thought-

fully seek to avoid all difficulty on this score by listing a wide range of body designs, finishes, trimmings and fittings and thus limiting their agents to certain more or less restricted lines of extra and special equipment. Perhaps this is the best plan to pursue, except where custom work is sought definitely and ample time allowed for filling orders properly. In general, special work has no place in a plant that is already crowded to keep up with its standard product. Exceptional orders, such as sometimes must be taken, while they may bring credit to the maker, are not to be encouraged.

## GREAT CROWD AT 24 HOURS RACE

Accidents and Tragedy at Brighton Beach  
Enrich Box Office—Basle-Poole Win  
on Dusty Track.

Amid the tumultuous cheers of the largest crowd that ever gathered to witness the finish of a 24 hours race in this country, the Simplex car, driven alternately by Charles Basle and Al Poole, won the first twice-around-the-clock contest of the season, at Brighton Beach New York City, on Saturday last, 14th inst., piling up a total of 1,145 miles for the long grind. Although numerous predictions were made that the record

foreign car in the race, which, piloted by DePalma and Parker, looped the mile oval 1,107 times. In the matter of tire equipment of the winners, an ever interesting question, Continental tires and demountable rims scored a double victory, being fitted to both the Simplex and Stearns.

Driving in their usual spectacular style, the Chevrolet brothers in Buick No. 1 made the running interesting for the field all the time, and finished fourth, with 1,049 miles to their credit. They also set up the only new hour records which the race produced, raising the four hours figures from 217 to 219 miles, and repeating the trick again in the fifth hour, when they changed the former record of 267 miles to 269. That consistency which in the past has landed it

the crash. Later the car again charged through the cloth barrier with Strang at the wheel, but he managed to keep it right side up and brought it back on the course. In the final tally it was credited with 989 miles. The next accident after that in which Bradley was killed occurred just after 2 o'clock in the morning. This time the trouble happened at the turn into the backstretch and the unlucky car was the Buick No. 2 driven by George DeWitt. The car lost a tire as it rounded the turn to the backstretch, swerved to one side and turned over. DeWitt escaped injury altogether, but Jack Tower, his mechanic, was thrown out and one of his legs was broken. He was taken to the hospital and will recover, it is said. Like his alternate, Burman supplied

EVIDENCE THAT THE COMPETING CARS KICKED UP SOME DUST

of 1,196 miles established last fall would be lowered, these prophecies never were in danger of being fulfilled, the winning team falling short of the record by 51 miles, despite the oft repeated assertions of the management that the track was "faster than ever." The race was marked by the usual fatality and numerous accidents, for which the track has an unenviable reputation.

Second honors went to a Stearns manned by Mulford and Patschke, who rolled up 1,120 miles. Although regularly on the Lozier staff, they were "loaned" for the occasion, as the Lozier interests declined to compete under the changed conditions by which the race was a free-for-all event instead of for stock cars, as in the past. Third place went to the Fiat, the only

well up in front was not displayed by the Rainier team, Disbrow and Owen, on this occasion, and fifth place, with 1,037 miles, was its portion. The last one to cross the four-figure division was the Croxton-Keeton, which made its first debut in 24 hour racing, and made a very creditable showing for a small car. Driven by Spenney and Lund, it slipped around quietly and regularly, and, although no match for the big fellows in speed, its plugging qualities resulted in a score of 1,004 miles.

Lewis Strang and Leo Anderson handled the ill-fated Marion, which figured in the first accident, going through the fence early Saturday morning and crushing its mechanic, W. F. Bradley, so badly that he died at the Coney Island Hospital an hour after

considerable of the fireworks in the early part of the race, and was conspicuous among the leaders, but after DeWitt's upset the car never again was a dangerous factor. At the finish it was in eighth position with 927 miles to its credit. Although protested by three other teams for violation of the rules by the alleged replacement of undamaged parts with new ones to more quickly complete a repair, the Chevrolets' Buick was allowed to finish, the Buick people taking an appeal from the referee's decision. The case will be decided by the contest board of the American Automobile Association.

Another debutant was the Cole, also in the small car class, which distinguished itself by making a hurried and informal

### SUMMARY OF THE 24 HOURS RACE AT BRIGHTON BEACH.

No.	Drivers and Car.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24

AT LEISURE AND IN ACTION IN THE REPAIR CAMPS

jump through the cloth fence, but returned to the track, although Endicott, the senior driver, received bruises which compelled his retirement; his mate, Edmonds, finished the race. The Cole rolled up 756 miles.

Ten of the twelve starters finished, the two delinquents being the Houpt-Rockwell and Stearns. Montague Roberts, who with Stanley Martin constituted the crew of the hyphenated and rejuvenated Bristol creation, did not make a very auspicious showing on his announced return to the racing game. Although it bore the supposedly lucky "7," this was not sufficient to offset the double combination of Friday, 13th. In the first hour the car was off the track for a long time with a leaking gasoline line, and in the 7th hour again went to the paddock with a broken steering knuckle, this time to stay three hours. Although hopelessly out of the race, the car again came out when repairs were completed and continued with indifferent luck until the 20th hour, when it again retired. It was announced in the 23d hour that a cylinder was cracked and the car was withdrawn. Howard and Dearborn, with Stearns No. 2, made things lively in the early hours of the race, setting a hot pace, and lasted nine

hours, when, with 435 miles opposite their names on the score board, the car was retired with a cracked frame.

Advertised more extensively in the daily press than any of its predecessors, the race drew the largest crowds in the history of such contests, the official attendance being given as 35,000. There were fully 20,000 persons and nearly 2,000 cars on hand for the start, which was delayed for an hour. The promoters certainly made hay while the moon shone, and are so elated over the gate receipts that they plan to stage another grind next month.

Not everyone who saw the race parted with the coin of the realm, however, for the far turns and fences on the back stretch were lined with men and boys who, when the officers were not looking, made a break for the infield and eventually lost themselves in the crowd.

In order that no careless spectator might get himself injured and attempt to deplete the strong box of the Motor Racing Association, that organization took extreme precautions to relieve itself of all responsibility. Over the entrance was a large sign warning all spectators to read the conditions under which they accepted tickets and which absolved the management from all

responsibility in case of injury of any kind.

Chevrolet evidently believed in the superstition attached to Friday the 13th and sought to rout any evil influences by carrying a Billiken on his radiator cap. Possibly this saved him from being put out of the race or going through the fence, but it didn't prevent a broken cam shaft.

Despite the "careful grooming by large gangs of men" for weeks previous, the track was as rutty and bumpy on the turns and in the straights as ever, while the dust on the first night was blinding. Rain on the afternoon following laid the dust for a few hours. The race was stopped for ten minutes shortly after midnight to restore the signal lights at the line, which were sagging so low that it was feared that they might become entangled with some of the cars.

#### Memphis Racemeet is Abandoned.

Giving as a reason for the postponement the inability of several prominent drivers to be present on that date, Homer George of New Orleans, who was promoting the racemeet scheduled to occur at Tri-State Park, Memphis, Tenn., on Saturday, 21st, has announced that the event has been laid on the shelf indefinitely.

TWO GENERAL VIEWS DURING THE 24 HOURS RACE

**BRAKES CHIEF CAUSE OF PENALTY**

**Many Perfect Road Scores in Harrisburg Contest Spoiled by Technical Examination—The Winners Announced.**

Of the 19 cars that finished the three days' endurance run of the Motor Club of Harrisburg, Pa., which ended on Wednesday, May 11th, only three managed to survive the 505 miles of cross-Pennsylvania and New Jersey traveling with perfect road and mechanical scores. The three honor markers were the Pullman, driven by N. Gallatin, which won Class A, for touring cars listing above \$2,000; the Kline-Kar, driven by J. A. Kline, which earned the only perfect score in the class for touring cars listing at \$2,000 and under, and the baby Maxwell, piloted by A. D. Rea, which scored the winning record in the class for runabouts selling at \$1,600 and under. The other winner, which none the less was a winner, although it did not get a perfect score, was the Inter-State, driven by W. W. Vandegrift, who won the class for roadsters listing at \$1,601 or over, with a debit of 11 points. Of this number 8 points were incurred for failure to reach the controls according to schedule during the third day's journey.

As described in last week's Motor World, the Motor Club of Harrisburg's third annual endurance contest began in that city on Monday, May 10th, the first day's journey taking the contestants to Atlantic City, N. J. Despite the rain and muddy roads encountered in Pennsylvania, only two cars lost points, although the strenuous going doubtless was responsible for many of the afterfindings of the technical committee which brought penalizations.

The second day's travel was over a course

in southern New Jersey from Atlantic City to Wildwood, and only three cars suffered penalization. In the final day's run from Wildwood back to Harrisburg rain and bad roads again were experienced and six cars, two of which had perfect scores until the beginning of Wednesday's run, were penalized. The first day's traveling from Harrisburg to Atlantic City was 168 miles, and the second day's route, from Atlantic City to Wildwood, via the roundabout way of May's Landing, Vineland, Alloway, Salem, Bridgeton, Millville and Cape May Courthouse, amounted to 139.6 miles. Wednesday's run was from Wildwood to Harrisburg, 197 miles.

Because of the immense amount of work entailed in examining the cars for technical faults and penalties against brakes, clutches and gears, the findings of the technical committee were not available until late Thursday. The results are shown in the appended table.

In view of the tremendous strain on the brakes while traveling over the hilly roads of eastern Pennsylvania, it is remarkable that any of the cars escaped the technical committee's searchlight, and the fact that only 6 cars of the 19 survivors escaped penalization in respect to brakes is an item that conveys a lesson in itself. Only one car was penalized under the heading of "gears," and one car was assessed 5 points on account of its clutch; a large number received points on minor technicalities.

All the winners deserve all the praise they received for coming through so well, but especial commendation must be awarded the baby Maxwell, which A. D. Rea, carried through the three days of long and exacting drives without a point against it in road, technical or mechanical classification. That such a little car was able to not only hold its own against more powerful and expensive cars, but to defeat a number, certainly is remarkable.

**Class A—Touring Cars Listing at \$2,001 and Above.**

**ON CHEYENNE'S FOUR MILES TRACK**

**Oldfield Does Lightning Mile on Dirt Course but Meets Defeat Later—Wyoming's Governor an Official.**

That it is not necessary to spend hundreds of thousands of dollars to build a motor speedway capable of producing records, and that the celebrated California speed-record climate has a formidable rival, conclusively was proved at Cheyenne (pronounced "Shyanne"), Wyo., on the 11th inst. After filling their engagement in the Mormon capital a few days previously, B. Oldfield & Co., who are playing one day stands on the Rocky Mountain slope and gathering in all the stray shekels that the alluring and thrilling publicity of the wily Bill Pickens brings their way, jumped over to Cheyenne on Wednesday, 11th, and did their stock repertoire of record trials and match races on the Cheyenne Motordrome. Surprising as it may appear, this practically unknown course, which is a four miles circle and was completed without any great blare of trumpets last summer, now presumably is the holder of the American mile track record.

Kirschner, who is the understudy of the star, opened the performance with an unsuccessful assault on the mile record of 36:22 established by Oldfield at the Los Angeles Motordrome last month. Clocked by the electrical timing apparatus, he pushed the Darracq for a mile in 43 seconds flat. Oldfield with the Benz, disdaining to warm up, attacked the half mile figures of 14:76 made by Hemery at Brooklands, England, but the first attempt netted him 18 seconds. On his second dash Oldfield was clocked in 17 seconds flat, and was loudly cheered for what the press dispatches stated was a new world's record, but which is far short of the mark.

"Me and My Car" next gave attention to the mile figures and apparently bettered his Los Angeles mark, so that the Cheyenners may have reason to be proud of their track. In his first flight Oldfield covered the mile in 38:52, and caused Bedlam to break loose on his second try, when it was announced that he had negotiated the distance in 36 seconds flat; a 100 miles an hour clip. This abducts the record from the Los Angeles saucer by 22-100 of a second. The authenticity of the time, however, is open to question, according to rumor in the East which credited Pickens with holding one of the watches. Then came the amateur mile record dashes, Harold Brinker, of Denver, pushing an American car the distance in 57 flat, and Lisle Branson, Buick, doing it in 1:02½.

Following the trials was an eight miles match between Oldfield in the Knox and Branson in a Buick, the latter having a min-

ute handicap. The Knox closed the gap at a rapacious rate and Branson won only by inches, being almost nailed at the tape. Time, 8:46 $\frac{3}{4}$ . Another "dirt track record" was established by Brinker in the 25 miles free-for-all, which he won in 25:05. Oldfield started with a Knox but was eliminated by a broken connecting rod, which allowed Branson, Buick, to take second.

Ideal weather favored the meet, which was held by the Cheyenne Motor Club under sanction of the American Automobile Association. Affidavits have been secured by the club officials from timers and surveyors attesting to the accuracy of the timing apparatus and the correctness of the distance.

The track, which was built at a cost of \$5,000, is circular and has a decomposed granite surface. This, together with the rare altitude, is said to be responsible for the fast times made. Over 5,000 persons witnessed the meet, Governor Brooks acting as an official, while 2,000 United States regulars from Fort Russell guarded the course.

The summaries:

Time trials—Half mile, Oldfield, Benz, first, 0:18; second, 0:17. One mile, Oldfield, Benz, first, 0:38.52; second, 0:36 (record); Kirscher, Darracq, 0:43; Harold Brinker, American, 0:57; Lisle Branson, Buick, 1:02 $\frac{1}{2}$ .

Eight miles match between Oldfield, Knox, and Branson, Buick (1:00)—Won by Branson. Time, 8:46 $\frac{3}{4}$ . Oldfield's time, 7:46 $\frac{3}{4}$ .

Twenty-five miles free-for-all—Won by Harold Brinker, American; second, Lisle Branson, Buick. Time, 25:05. Oldfield also started but did not finish.

#### Oldfield & Co. at Ogden Races.

Although 5,000 persons crowded into the grandstand and bleachers at the half mile track in Ogden, Utah, Monday afternoon, 9th inst., to witness the race meet promoted by B. Oldfield & Co., the racing was nothing to brag about and the crowd consequently was more or less disappointed. The track was soft and dusty, and therefore slow time was made in all the events. The best Oldfield could do in his mile time trial was 1:12, while Kirscher's time was 1 $\frac{3}{4}$  seconds slower. Oldfield defeated Kirscher in a match. The summaries:

One mile against time—Won by B. Oldfield, 1:12; second, Ben Kirscher, 1:13 $\frac{3}{4}$ .

Five miles stock chassis handicap, "for Ogden champion"—Won by Bert Angel, Buick; second, B. Oldfield, Knox; third, Frank Irving, Thomas. Time, 6:51.

Two and one-half miles match between B. Oldfield and B. Kirscher—Won by Oldfield, Knox; second, Kirscher, Darracq. Time, 3:33 $\frac{1}{2}$ .

Three miles handicap, free-for-all—Won by Carl Winters, Buick; second, Frank Irving, Thomas; third, B. Oldfield, Knox. Time, 4:15. Also ran—Ben Kirscher, Darracq.

## DENVER DEFIES FRIDAY, THE 13TH

But the "Hoodoo" Works and an Accident Happens and Rain Falls—Oldfield & Co. in Evidence.

Friday, the 13th inst., proved an unlucky day for the promoters of the Overland Park automobile race meet at Denver, Col., on that date. B. Oldfield & Co. were the scheduled attraction, but the dusty track prevented the star of the troupe from doing better than 54 $\frac{1}{2}$  seconds for the mile. The 5,000 or less spectators consequently were disappointed. This, however, was not the unlucky feature of the meet. The hoodoo day of the week and month brought disaster to George A. Clarke, who ran his Overland car through a high board fence and injured himself and J. Allen, mechanic. The mishap occurred in the 10 miles race for cars listing at \$1,250 and under, which, with the exception of two rattling good motorcycle races, was the only event run before the rain came up and made further racing impossible.

Despite the threatening weather on Saturday, 14th inst., nearly 3,000 spectators journeyed to Overland Park to witness the second day's racing and the continuation of the program that was interrupted on Friday. Although it was raining hard in the city of Denver, the shower held away from the track and the latter was exceedingly dusty. For that reason the events were not as much appreciated as otherwise might have been the case.

Oldfield again tried for a fast mile, but he was a keen disappointment. It is true that he made the circuit in 53 $\frac{1}{2}$  seconds, but his press agent had led the people of Denver to believe that Barney would travel at the rate of 40 seconds or under, and for that reason 53 seconds to them seemed unusually slow. Kirscher, in a car of half the horsepower, made a mile in 55 $\frac{1}{2}$  seconds, and was the real star of the occasion, as he won a three miles handicap for a cup that was presented by the Governor. Kirscher also won the five miles free-for-all handicap.

In the stock car events, the two miles novelty was won by a Chalmers-Detroit, while Harry Bell, in an Overland, won the five miles scratch race over Peyton Hough, in a Warren-Detroit. The summaries:

#### First Day—Friday, May 13th.

Five miles motorcycle, professional—Won by B. W. Brazie, Merkel; second, Earl Armstrong, Indian; third, Glen W. Boyd, Indian. Time, 4:50.

Five miles motorcycle match, professional—Won by Joe Wolters, Merkel; second, A. V. Stratton, Excelsior. Time, 5:54.

One mile against time—By Barney Oldfield, Benz, 0:54 $\frac{1}{2}$ .

Ten miles, stock chassis listing at \$1,250 and under—Won by Peyton R. Hough, Warren-Detroit. Time, not given.

#### Second Day—Saturday, May 14th.

Five miles motorcycle match, professional—Won by Joe Wolter, Merkel; second, Alva Stratton, Excelsior. Time, 5:24 $\frac{3}{4}$ .

One mile time trials—Barney Oldfield, Benz, 0:53 $\frac{1}{2}$ ; Ben Kirscher, Darracq, 0:55 $\frac{1}{2}$ .

Five miles motorcycle, professional—Won by Earl Armstrong, Indian; second, Walter Brazie, Merkel; third, Glen W. Boyd, Indian. Time, 4:48.

Five miles for stock chassis—Won by Harry Ball, Overland; second, Peyton Hough, Warren-Detroit. Time, 6:20.

Two miles against time—By Barney Oldfield, Benz, Time, 1:49.

One mile against time—By Ernest McMillan, National. Time, 1:06.

Five miles free-for-all handicap—Won by Ben Kirscher, Darracq (scratch); second, Ernest McMillan, National (0:40). Time, 5:11 $\frac{3}{4}$ .

Five miles motorcycle match, professional—Won by Joe Wolters, Merkel; second, Alva Stratton, Excelsior. Time, 5:28 $\frac{1}{2}$ .

Two miles novelty, stock chassis—Won by Chalmers-Detroit; second, Peerless; third, Ford. Time, 4:03 $\frac{3}{4}$ .

Three miles free-for-all handicap—Won by Ben Kirscher, Darracq (scratch); second, Harry Ball, Overland (1:00); third, Peyton Hough, Warren-Detroit (0:40). Time, 3:00.

#### After the Cross-Continent Record.

Emblazoned with signs bearing its name, the tires it wears, the oil it uses and similar information concerning its equipment, a 30 horsepower Mercer car with C. H. Bigelow at the wheel left New York City early on Monday, 16th, in an attempt to establish a new transcontinental record. Bigelow's destination is Los Angeles, Cal., approximately 4,000 miles, according to the route which he will follow, and he plans to do all his driving by daylight. As outlined at present, the route includes Wheeling, W. Va., Columbus, O., St. Louis, Mo., and thence along the old Santa Fe trail. If Bigelow is inside the record when he reaches New Mexico he will be relieved by Harold M. Hanshue, the California crack. Indicative of the strenuous roads which are expected to be encountered, the car is equipped with shovels, tackle and other similar impedimenta. The best record for the cross-continent journey is held by a Franklin car—362 hours, made in 1906.

#### Trying to Revive Lowell Speed Carnival.

Despite the bad taste left by the deficits of the last two years, influences are at work to bring about a repetition of Lowell (Mass.) road race carnival on Labor Day. It is said that some of the influence is being supplied by New Yorkers.

**PATHFINDERS' TASK COMPLETED**

**They Receive Warm Welcome at Chicago  
and an "Extra" at Detroit—Glidden  
Route 2,839 Miles Long.**

Thirty-two days out from Cincinnati, O., where the tour will start on June 14, the Chalmers-Glidden pathfinder rolled into Chicago, the finishing point, on unlucky Friday the 13th, with its odometer registering 2,966 miles, and where it was accorded a hearty welcome by the large gathering of motorists that were on hand to await its arrival. The scouts were met at Davenport, Ia., by members of the Chicago Motor Club, and another delegation, among which was Hugh Chalmers of the Chalmers Motor Co., greeted them at Geneva, Ill., the escort gradually increasing as the Windy City was neared. Friday night the scouts were guests of the motor club at a banquet held at the Chicago Athletic Association, which was largely attended by prominent motorists. Speeches were made by David Beecroft, president of the Chicago Motor Club; Dai Lewis, the pathfinder; Hugh Chalmers, president of the Chalmers Motor Co.; Thomas J. Hay, vice-president of the Chicago Motor Club; E. L. Ferguson, of the A. A. A.; S. M. Butler, chairman of the A. A. A. contest board, and Harry T. Clinton, secretary of the Chicago Motor Club.

Most of the speeches had to do with the tour, but Mr. Chalmers delivered an address on the condition of the motor industry, in which he declared that it is a "stable" institution; that it is not a craze, and that soon it will become a selling proposition that will mean a survival of the fittest so far as the manufacturers are concerned. He predicted that inside of five years horses would not be permitted inside the loop district in Chicago.

Secretary Clinton announced that the Motor club has decided upon a huge bronze plaque for the Chicago trophy in the Glidden tour.

Following the arrival of the pathfinders in Chicago, a meeting of the powers that be was held, among those in attendance being Secretary Butler of the A. A. A., David Beecroft, a member of the contest board; Dai Lewis and E. L. Ferguson. After hearing Lewis's report, it was decided to change the start of the tour to June 14, the change being necessitated by the requirement of an extra day to make the run between Dallas and Oklahoma City, which was not allowed for in making up the schedule. The total length of the tour will be 2839 miles, instead of the 2,500 originally calculated on, and it will pass through thirteen states.

The daily itinerary, as now officially decided upon and which probably is final, will be as follows:

Days.	Miles.
1 Cincinnati to Louisville.....	162
2 Louisville to Nashville.....	193
3 Nashville to Sheffield.....	119
4 Sheffield to Memphis.....	161.7
5 Sunday in Memphis.	
6 Memphis to Little Rock.....	207.7
7 Little Rock to Texarkana.....	191.6
8 Texarkana to Dallas.....	217.1
9 Dallas to Lawton, Okla.....	200
10 Lawton to Oklahoma City, Okla.....	145
11 Oklahoma City to Wichita.....	216
12 Sunday in Wichita.	
13 Wichita to Kansas City.....	234
14 Kansas City to Omaha.....	242
15 Omaha to Des Moines, Iowa.....	160
16 Des Moines to Davenport, Iowa.....	190
17 Davenport to Chicago.....	200

The longest day's run will be between Kansas City and Omaha—242 miles—and the shortest will be from Nashville to Sheffield, Ala.—119 miles. The average daily run will be 189 miles, and the two Sundays en route will be spent at Memphis, Tenn., and Wichita, Kan., respectively.

Enthusiastic as was the welcome which Chicago gave to the pathfinders, it was surpassed by Detroit when Joe Gardham brought the car back to its home city on Monday, 16th. Seven miles outside the Straits City he was met by a reception committee headed by Mayor Breitmeyer, and including Hugh Chalmers, and Abner Larned of the Detroit Chamber of Commerce. After a short speech of welcome by the Mayor the escort of 30 cars formed in line and wended its way back to the heart of the city. Upon its arrival they were met by a large party of motorists, who welcomed the return of the pathfinder and its driver with hearty cheers.

For the first time in the history of the tour the pathfinding car will be a contestant for the Glidden trophy and will be driven by Gardham as a reward for his work in piloting the pathfinder on the exploring trip. That the knowledge which he gained on the pathfinding trip will be of immense advantage to him in the contest readily will be appreciated. On its arrival in Detroit the car had traveled 3,175 miles and brought back a record of not having killed a chicken or dog on the trip.

**Miss Scott Starts for the Coast.**

"Looking just too sweet for anything" and "smothered with bon voyage bouquets," to quote John C. Wetmore, a bachelor and a rare judge of that sort of thing, Miss Blanche Scott, accompanied by Miss Amy L. Phillips, left New York on Monday afternoon last, 16th inst., for their "tour de demonstration" to the Pacific Coast. Miss Scott was at the wheel of the white and gold Overland car, of course, for she is "the girl" referred to by the sign on the car: "The Car, the Girl and the Wide, Wide World." Miss Phillips, in Wetmore French, is Miss Scott's "souer de voyage." Miss Scott was attired in brown, Miss Phillips in blue. Previous to their departure, they were the guests at a luncheon served at the Claremont on Riverside Drive.

**BROOKS RUNS UP MISSOURI HILL**

**Makes Fastest Time in Kansas City Climb—  
Other Honors Well Distributed—  
One Spill Occurs.**

A. O. Brooks, driving a Lexington car, won the free-for-all event and scored the fastest time in the annual hill climb of the Automobile Club of Kansas City, Mo., held on the Dodson hill, near that city, on Saturday afternoon last, 14th inst. In the free-for-all class Brooks covered the 6-10 mile incline in 55½ seconds, which breaks the record for the course by 4½ seconds, the previous mark having been established in 1908.

Because of insufficient policing the climb was not as successful as former contests of the sort. The officials were unable to cope with the 3,500 spectators who crowded over the course, and the soft turns caused more than a dozen drivers to withdraw after reaching the course. Roy O. Kendall furnished the only exciting incident, when he overturned on the soft upper turn and put his Pennsylvania car out of commission. Kendall jumped as the car upset and escaped injury. The winning cars in the various classes were:

Cars costing under \$800—Won by Krit, 1:31½. Other entrants withdrawn.

Cars costing between \$800 and \$1,200—Won by Ford, 1:06½; second, Ford, 1:27.

Cars costing between \$1,201 and \$1,600—Won by Parry, 1:06½; second, Great Western, 1:07½; third, Everett, 1:13½.

Cars costing between \$1,600 and \$2,000—Won by Jackson, 0:58½; second, Henry, 1:10; third, Auburn, 1:12; fourth, Enger, 1:15; fifth, Herreshoff, 1:27.

Cars costing between \$2,000 and \$3,000—Won by Pennsylvania, 1:03; second, Jackson, 1:06½; third, Great Smith, 1:10½.

Cars costing between \$3,000 and \$4,000—Won by Palmer-Singer, 1:05; second, Palmer-Singer, 1:06½; third, Robert Mesch, Palmer-Singer, 1:26.

Free-for-all, cars under \$3,000—Won by Jackson, 0:55½; second, Lexington, 0:56; third, Great Western, 1:00; fourth, tie between Apperson and Ford, 1:00½; fifth, Great Smith, 1:02; sixth, Jackson, 1:05.

Free-for-all (no restrictions)—Won by A. O. Brooks, Lexington, 0:55½; second, Jackson, 0:56½; third, Apperson, 0:59½; fourth, Great Smith, 1:00½. Pennsylvania overturned.

**Spencer Heads the Sedalians.**

Automobile owners of Sedalia, Mo., have formed the Sedalia Automobile Club, with the following officers: S. E. Spencer, president; W. H. Highleyman, vice-president; Damon Fay, secretary; F. W. Phipps, treasurer. The organization starts with 17 members.

## MUST DRAW LOTS FOR THE MEDALS

**Nineteen Perfect Scores in New Jersey Run and Only Six Gold Medals—Those Who Earned Them.**

After a week's delay the Motor Contest Association has announced the results of his two days easy contest from New York to Atlantic City and return, May 10th and 11th. There were 19 perfect scorers out of 31 starters, and as there was but one gold medal in each class, or six in all, the 19 are to be asked to draw lots to decide the ownership of the really and truly gold medals. The others who qualified will have their disappointment assuaged, however, by receiving medals which are gold on the outside, whatever they may be beneath the surface. Silver and bronze medals constitute the second and third prizes, respectively, in each class.

Following are the results:

Class 1A—Cars listing at \$800 and under.	
Driver and Car.	Penalizations.
R. E. Gillam, Hupmobile.....	0
E. D. Cutting, Hupmobile.....	9
Class 3A—Cars listing between \$1,201 and \$1,600.	
W. H. Bowers, Regal.....	0
George L. Reiss, Overland.....	0
W. Mulstay, Maxwell.....	1
W. C. Davenport, Buick.....	191
*F. Warmington, Cole.....	1000
Class 4A—Cars listing between \$1,601 and \$2,000.	
Lewis Strang, Pierce-Racine.....	0
Herbert F. Earl, Auburn.....	0
Paul Harvey, Franklin.....	0
Joseph Bell, Chalmers.....	0
W. F. Bradley, Marion.....	0
N. L. Lichtenberg, Cadillac.....	0
L. R. Burne, Cadillac.....	0
Leo Anderson, Midland.....	0
Philip Hines, Buick.....	1
Charles Schaefer, Maxwell.....	3
*J. L. Bryer, Koehler.....	1000
Class 5A—Cars listing between \$2,001 and \$3,000.	
Richard Newton, Stoddard-Dayton....	0
W. C. Poertner, National.....	0
O. R. DeLamater, Mitchell.....	0
Charles Hinman, Mora.....	0
Joseph Trehou, Mercer.....	0
Class 6A—Cars listing between \$3,001 and \$4,000.	
Charles F. Fox, Franklin.....	0
Neil Whalen, Matheson.....	0
Robert M. Flagg, Welch-Detroit.....	2
W. C. Spenney, Croxton-Keeton.....	21
†W. E. Shuttleworth, Haynes.....	1051
Class 7A—Cars listing \$4,001 and over.	
V. P. Pisani, Zust.....	0
Joseph Kingsland, Zust.....	41

\*Out; accident. †Withdrawn.

### Amateur Association Abandons One Event.

Because of conflict with other competitions which are carded for the same day, and also owing to the fact that the association has a hillclimb scheduled on Ander-

son's hill, White Plains, N. Y., on Saturday, 28th, two days previous, the Amateur Automobile Contest Association, which is composed largely of New York brokers and bankers, has decided to postpone its climb on Briarcliff hill, which was set for May 30th. It probably will be held later in the season. Coincident with this action, the card for the White Plains climb has been lengthened by the addition of a free-for-all class, in which each contestant will have two trials. There will be five events, held under A. A. A. rules and sanction, the Wall street amateurs, who first flouted it, having had a second "think" and decided to recognize A. A. A. authority.

### Philadelphians Back a Motordrome.

The Philadelphia Motordrome Association, which recently was incorporated under the laws of New Jersey with capital stock of \$2,000,000, has for its purpose the erection of a two miles vitrified brick track at Clementon, N. J., 12 miles from Philadelphia, where, it is stated, 663 acres of high, dry land have been purchased. George H. Robertson, the racing man, will supervise the building of the track—when the construction work begins.

The plans call for concrete stands, with seating capacity for 50,000 persons; for a hotel with roof garden, etc.; for a club house; for garages and for buildings in which to house a permanent exhibition of cars and accessories. Indeed, the prospectus is very similar to the Atlantic City motordrome project, which never came to a head. Blue prints of the Clementon motordrome already are in existence, however. The officials of the company, as given by its publicity man, are as follows:

A. C. Patterson, president Excelsior Trust Co., Philadelphia; H. S. Reed, assistant treasurer Union Trust Co., Philadelphia; L. Kuehnle, president Marine Trust Co., Atlantic City; M. R. Margerum, secretary Interstate Fair, Trenton, N. J.; Geo. H. Robertson, winner Fairmount Park races, New York City; Mayne C. P. Parker, M. & M. E., Philadelphia; Harry J. DeBear, automobile department, the Bulletin, Philadelphia; Edward L. Bixby, manager C. E. Miller Co., Philadelphia; C. E. Folmer, ex-Recorder Deeds, Pottsville, Pa.; Frank G. Cassler, decorator, Philadelphia; W. H. Woodward, attorney-at-law, Philadelphia. Counsel for P. M. A., S. Boyer Davis and Weaver & Drake. Architects, Milligan & Webber.

### Sea Gate Motorists Form a Club.

Motorists of Coney Island and vicinity have formed the Sea Gate (N. Y.) Automobile Club with the following officers: T. H. Schneider, president; Gottfried Wasternacher, John Petri, T. Angermeier, vice-presidents; Harry Newmann, secretary; M. Brayer, treasurer. The membership is restricted to fifty. There are twenty-four names on the roll at present.

## RACING AT THE ROSE CARNIVAL

**San Franciscans Gobble Everything at Santa Rosa Meet—Ruddle and Murray the Biggest Winners.**

San Francisco cars and drivers carried away all the prizes at the two days race-meet held in connection with the annual rose carnival at Santa Rosa, Cal., on Friday and Saturday, May 6th and 7th. The biggest scorer at the meet was A. Ruddle, who piloted his Ford to victory in five events and scored second in the only other event in which he was entered. Frank Murray, Buick, also was a heavy scorer, winning four firsts, one second and one third. C. O. King, in a Maxwell, was the most persistent runner-up, finishing second four times, besides winning one race. The attendance was good on both days and a majority of the races resulted in close finishes. One of the most exciting events was the 5 miles scratch on Friday, when Murray and King fought neck and neck all the way, the former winning by a foot.

The summaries:

### First Day—Friday, May 6th.

Five miles for stock chassis, 230 cubic inches—Won by A. Ruddle, Ford; second, W. C. Morris, Autocar; third, Frank O'Brien, Ford. Time, 5:42½.

Ten miles stock chassis, 231 to 150 cubic inches—Won by C. O. King, Maxwell; second, Frank Murray, Buick. Time, 10:27¾.

Ten miles stock chassis, 230 cubic inches—Won by A. Ruddle, Ford; second, W. C. Morris, Autocar. Time, 10:58¾.

Five miles stock chassis, 231 to 450 cubic inches—Won by Frank Murray, Buick; second, C. O. King, Maxwell. Time, 5:12¼.

Ten miles handicap, for first and second finishers—Won by Frank Murray, Buick (0:59); second, A. Ruddle, Ford (0:35); third, Walter Morris, Autocar (1:05). Time, 10:27¾.

### Second Day—Saturday, May 7th.

Five miles stock chassis, 230 cubic inches—Won by A. Ruddle, Ford; second, Walter C. Morris, Autocar; third, Frank Murray, Buick. Time, 5:26¾.

Ten miles stock chassis, 231 to 450 cubic inches—Won by Frank Murray, Buick; second, C. O. King, Maxwell. Time, 10:13¾.

Ten miles stock chassis, 230 cubic inches—Won by A. Ruddle, Ford; second, Walter C. Morris, Autocar; third, Frank Murray, Buick. Time, 11:01.

Five miles stock chassis, 231 to 450 cubic inches—Won by Frank Murray, Buick; second, C. O. King, Maxwell. Time, 5:16¾.

Ten miles handicap for first and second finishers—Won by A. Ruddle, Ford (0:40); second, C. O. King, Maxwell (0:14). Time, 11:58.

**WHITE WILL RETAIN LONG STROKE**

**First Announcement of the 1911 Line—  
High Powered Gasolene Model to be  
Produced this Fall.**

Six different models altogether will comprise the line of White cars which is to be produced during the latter part of the present year and the beginning of next. Four models will be designed for pleasure service,

NEW TORPEDO BODY OF WHITE GASOLENE CHASSIS.

two each of the gasolene and steam types, and two for commercial work. Announcement to this effect made by the White Co., of Cleveland, carries the unexpected information that a new gasolene chassis is to be added to the present line, thus completing the balance between the gasolene and steam models, affording in each class one of medium and one of higher horsepower.

Structural details of the new gasolene model have not been disclosed as yet, save for the bare announcement that the power plant will be of 40-60 horsepower and will rank as a seven-passenger machine. It will be ready for fall delivery, however, and it is promised that it will embody several radical features.

The existing models, having proved entirely satisfactory, are being continued with very few changes in construction. The gasolene car, which was introduced nearly a year ago, like the famous steam car, has required little alteration. Its power plant, which forms the basis of both the gasolene pleasure and commercial products, retains the neat and compact character which already has brought it some little distinction.

The four cylinders are cast in block form, with intake and exhaust passages integral, thus doing away with external manifolds, and besides cleaning up the exterior of the motor, introducing a number of advantages. The intake gases are heated as they pass to the cylinders, while the exhaust, by contact with jacketed surfaces, are cooled as they leave the cylinders and so are robbed of a portion of their superfluous energy. This not only assists in muffling the

exhaust, but tends to facilitate the clearing of the waste products from the cylinders. The long-stroke feature of the engine is retained in the unchanged dimensions. The stroke of  $5\frac{1}{8}$  inches is roughly  $1\frac{1}{4}$  times the bore, which is  $3\frac{3}{4}$  inches.

The valve gear is entirely enclosed. The springs and stems are enclosed by a removable plate. As both sets of valves are placed on the left side of the motor, only one cam shaft is required, and that has a rather unusual feature in the compression

releasing device, which is employed to facilitate starting. By means of a small lever mounted on the dash immediately in front of the steering wheel, it is possible to give the cam shaft a slight longitudinal move-

WHITE GASOLENE CHASSIS SHOWING COMPACT POWER PLANT.

ment in its bearings. The effect of this is to bring a special set of cam faces under the exhaust lifters, thus keeping the valves unseated during a portion of the compression stroke. As soon as the motor has been started, the shaft is returned to its normal position and the valve motion is taken up in the regular way.

Another excellent feature of the motor is the oiling system. The two-bearing crank shaft, which is mounted in annular bearings, is formed with oil ducts, leading from grooves on each crank disc, which are eccentric with respect to the cranks. The effect of this arrangement is to cause the oil to be circulated through the ducts by centrifugal force from each of the end bear-

ings to the first crank pin bearings, from the outer crank pins to the two central ones circulation also is maintained by centrifugal force. The oil is led outward through ducts to oil pipes, which are mounted on the face of the crank webs, the result being that the direction of flow for the entire distance through which the oil travels is eccentric to the shaft movement, so that it is impelled entirely by centrifugal force.

The main oil reservoir is located in one of the crank case supporting arms, which is enlarged for the purpose, and from which a gear driven pump lifts the oil to a single sight feed glass located on the dash. From the sight feed glass the flow is by gravity to the end crank shaft bearings, whence the circulation to the lower connecting rod and shaft bearings is as already indicated, while the upper end bearings and the pistons are lubricated by the familiar splash system. Overflow arrangements preserve the proper level in the case and prevent flooding and the system is otherwise safeguarded against abuse.

Ignition is secured by means of the Bosch high tension magneto system, the magneto itself being placed on the right side of the engine, where, with the centrifugal water circulating pump, it is entirely removed from the carburetter and valve gear, and is thus more or less isolated from sources of possible injury. As the illustration makes plain, the exterior of the motor is particularly clean, a slight alteration in the arrangement of the water piping since the

model first was introduced, contributing to this effect.

Transmission is through a leather-faced cone clutch, which is distinguished by reason of the method employed for attaching the leather facing to the cone. Instead of the usual rivets, a series of T-head bolts are used, which are drawn up from the inside of the conical rim and serve to force the leather into corresponding slits in the surface of the cone, thus securing it positively and at the same time avoiding the necessity of piercing it at a number of different points. Adjustable pedals are used for both the clutch and the service brake, this feature being made possible by the direct thrust motion of the pedal arms.

The change speed mechanism, which is mounted in the waist of the chassis directly back of the clutch, is supported on three lugs which are carried by two cross frame members. It is of the selective sliding pinion type, and affords four forward speeds,

fer materially in point of chassis design and size, as well as in transmission gear ratio. As is customary in handling commercial vehicles, the bodies are made to suit the requirements of the purchaser, and may be adapted to a wide variety of purposes.

matic regulating devices on the water, fuel and steam controls, the operator is relieved of all care in regard to them and the generation of steam proceeds in direct obedience to the demands of the engine.

The engine is of the two-cylinder, compound condensing type, with piston slide valves and the so-called "Joy" valve gear. A recent innovation is the adjustable burner which may be regulated to adapt it to different grades of fuel, such as gasoline, kerosene or even lower grades of distillate. On the Pacific Coast, indeed, most of the White steamers in use burn a cheap and low grade fuel known as "California distillate," which is said to have given the best of satisfaction.

The two types of steam car are known, respectively, as models "O-O" and "M-M." The former is rated at 20 horsepower output, and is a five-passenger touring car of 110-inch wheel base and 32 by 4 inch tires; it also is built in limousine form. The larger model is built on 122 inch wheel base, has 36 by 4 inch tires, and its power plant is rated at 40 horsepower output. In seven-passenger touring form it is designated as the "Presidential pattern," owing to the circumstance of the use of a car of corresponding form by the Chief Magistrate of the United States. Five-passenger touring bodies also are fitted to the larger chassis, as are limousines built to accommodate either five or seven passengers.

#### Injury Done by High Gear Stunt.

While it is perfectly possible to induce a car to run very slowly on high gear by the

RIGHT SIDE OF WHITE ENGINE

VALVE GEAR ON LEFT SIDE

the direct driving relation being secured on the third speed, with the fourth speed "geared up." This arrangement, which is rather out of the ordinary, when employed, generally is applied only to cars of much greater power. Final drive to the semi-floating rear axle is through a double jointed propeller shaft. The torque reaction is absorbed through the forward ends of the rear springs, which also drive the car.

Although here treated as one car, the present gasoline pleasure line actually is listed in two distinct models, on which basis the forthcoming output would consist of seven instead of six models. Actually the difference between the two gasoline types now on the market is confined largely to matters of wheel base, tire size, and body design. The two forms are distinguished as models "G-A" and "G-B." The former has 110-inch wheel base and is fitted with 32 by 4 inch quick detachable tires; it may be equipped with either five-passenger touring, four-passenger small tonneau, or torpedo types of body, and is adapted to receive the rear attachment, which constitutes the "Domestic Express" equipment, which is the designation applied to a form of light baggage carrying body.

Model "G-B" has a wheel base of 120 inches, 34 by 4 inch tires, and is somewhat heavier in the matter of frame construction. Its body equipment takes the form of a roomy five-passenger touring structure, or a limousine or landaulet. Both styles now are equipped with three-quarter elliptic rear springs, instead of with semi-elliptics as formerly, while a minor alteration in the form of the radiator filling cap, as well as the altered lines of the torpedo body, assist in the slight distinction between the present output and that of the first series of cars, which now have been entirely disposed of.

The commercial vehicle line consists of a 3-5 ton and a 1½ ton chassis, which remain the same in construction as heretofore, and which have the same motor as is used in the present gasoline cars but dif-

CRANK SHAFT OILING DUCTS

WHITE CHASSIS SHOWING CLUTCH AND GEARSET FEATURES

The construction of the steam models remains practically the same as in the preceding series. As heretofore, the semi-flash generator consists merely of a closed coil of steel tubing, capable of holding less than a third of a cubic foot of steam and water in the 40 horsepower size. By means of auto-

expedient of gently applying the service brakes, the practice is not advisable, even under stress of slow-moving traffic, when it is desirable to drive as slowly as possible and yet to avoid frequent gear changes. It overheats the brakes and creates undue wear in the linings.

## ZEBRA STRIPES FOR SIAM'S KING

**His Majesty Purchases an American Car of Distinctive Appearance—Its Equipment and Its Royal Billiken.**

Although King Chulalongkorn of Siam already is said to possess quite a collection of automobiles, he is still adding to it. His latest purchase is a 40 horsepower four cylinder Maxwell touring car. It mounts a specially constructed limousine body and is distinguished by zebra stripings and radiator cap surmounted by a quill and inkpot Billiken, typefying royal authority. Every appointment that makes for com-

SPECIAL MAXWELL LIMOUSINE FOR KING OF SIAM

fort, convenience and safety has been incorporated in the car.

The interior is upholstered in a rich pearl gray silk, with gold brocade, and a priceless rug is to adorn the floor. Among other distinctive features are a stationary French beveled oval-shaped mirror, collapsible *escritoire*, complete toilet set, floral vases, electric lights, interior speedometer, speaking tube, especially constructed wardrobe under seats and adjustable foot rests with silk plush pillow-shaped hassocks. Silken curtains bearing the royal crest in golden embroidery are operated simultaneously by a single draw cord. With colors beautifully harmonious, the interior is veritably a symphony in gray.

Capt. Lgopoopooff, of the Royal Palace Guard, has been appointed royal chauffeur and will accompany the car en route to Bangkok, Siam.

### The Air a Gasolene Car Consumes.

Most motorists are aware of the fact that automobiles use quite a large volume of air in the "mixture" which is exploded in the cylinder, but few could tell off-hand just what is the proportion of air to a gallon of gasolene. This was brought out by H.

Clifford Brokaw, in a lecture before the New York West Side Y. M. C. A. last week. He fixed the amount of air used for every gallon of gasolene at 8,580 gallons, and remarked that, as air is free of cost, it follows that if a greater proportion of gasolene than the theoretically correct one is used, it carries with it greater cost and less efficiency.

"It is not very difficult to tell whether or not you are feeding the correct mixture," said Mr. Brokaw. "Watch the exhaust pipe. If the exhaust is black, it means that you are feeding too much gasolene. If the exhaust pipe, on the other hand, sends out clouds of rank-smelling, blue-looking smoke, it means that you are feeding too much lubricating oil. The majority of mo-

torists use too much gasolene and too much oil.

"If the upkeep of your automobile is very great and the outlay for gasolene, oil, tires and repairs seems to be leading you straight to bankruptcy or the county poorhouse," said Mr. Brokaw, "stop, take an accurate accounting and locate the leakage, for your machine, once bought, should not be a constant drag on your purse. It's the owner's own ignorance that too frequently makes his automobile appear in the light of an expensive luxury. It is the man and not the machine that is at fault."

### Picturesque Park Opened to Motorists.

Palmer Park, the beautiful scenic resort near Colorado Springs, has been thrown open to motorists. This is a triumph which the motor car obtained by sheer progress, for the late donor of the park, Gen. J. W. Palmer, had inserted in the deed of conveyance a clause that automobiles should be barred until "horseless carriages shall be improved so that they are as noiseless as horse-drawn vehicles." That the powers that be consider that this time has arrived is indicated by the raising of the embargo placed upon the motor car.

## COMPLEXITIES OF CARBURETTERS

**Foreign Notion of the Principles Involved—Areas, Choke Tubes, Atomizing and Other Considerations Discussed.**

Despite the complexities which surround the operation of the ordinary carburetter, it is a fact not generally appreciated that the design of a carburetter of the ordinary sort is far from difficult. Indeed, like the calculations which are involved in designing the connections to an ordinary steam engine, the sole basis is the area of intake to the cylinders, which thus becomes the unit of consideration. Indeed, if questions as to the absolute uniformity of the mixture applied to each charge be set aside, or if the compensation for different speed conditions be supposed negligible, it would seem that a very fair sort of carburetter might be designed and built by almost anybody, and that, too, without serious perplexity or difficulty. At least, such would be the natural conclusion were judgment to be based solely on an exposition of the principles of carburetter design which a foreign expert recently has laid down.

"The almost universal use of carburetters of the float feed spray type has caused the development of this portion of the motor car along various lines, all of which lead to increased efficiency," is his optimistic conclusion on the subject. There is, however, according to his opinion, still some doubt as to the principle to adopt in proportioning the various areas of the throttle, choke tube and jet, in order to get the most satisfactory results. He is reasonably certain, nevertheless, that the best method to follow is that of making all calculations dependent on the area of the throttle. "It is, of course, assumed that the area of the throttle when fully opened is sufficiently large to supply the engine with a full charge of mixture without unnecessary restriction," he says.

"When running under full throttle it is obvious that all the air passing through the carburetter must enter through the combined passages formed by the choke tube and the extra air ports, no matter what form these may take," he explains. "In order to obtain the greatest efficiency from the carburetter it is of the utmost importance that the combined area of these ports should be at least equal to the throttle area. If this latter condition be fulfilled it may be accepted that the fuel mixture will pass through the carburetter with a minimum of resistance; in fact, it is an essential condition if maximum power is to be obtained from an engine.

"These combined areas being known, the next point is to determine the choke tube area in relation to that of the extra air port, and on this question there is still a great

difference of opinion, judging from present-day construction. Generally speaking, the smaller the choke tube the slower will the engine run, and, if the combined areas referred to are maintained, it does not follow that a carburetter with a reasonably small choke tube is less efficient than a carburetter with a large one.

"The difficulty with a large choke tube is that throttle sensitiveness is lacking when a nearly closed position obtains, because of the fact that as soon as throttle area falls below the area of the choke tube control of the mixture is lost unless the carburetter is set for a very rich mixture. Hence, to ensure easy starting and slow running a small choke tube is necessary. In practice this area varies from one-eighth to one-quarter of the full throttle area, and for ordinary conditions a choke tube area equal to one-sixth of the throttle area will be found to give very satisfactory results.

"Coming now to the more vital question of fuel adjustment, this is usually determined in two stages, and is perhaps the most troublesome part of present-day carburetter adjustment. The first operation entails adjusting the carburetter to give the correct level of gasoline at the jet; this is at the best a tedious operation, and when it has been effected, the size or area of the jet aperture must then be found. This is usually done by fitting the carburetter to the engine it is intended to feed, and then enlarging or reducing the jet aperture until the best running mixture is obtained.

"It is common knowledge that some carburetters do not effectively atomize the gasoline, but pass a column of spirit which maintains a more or less compact mass until it reaches the engine, and it is also well known that an effectively sprayed mixture gives more economical running.

"With a view to completely atomizing the fuel, endeavors have been made from time to time to utilize wire gauze for this purpose. These attempts have failed more or less for two reasons: Firstly, the gauze was placed at such a distance from the jet that the velocity of the fuel had fallen to low values; secondly, air impregnated with road dust, etc., was drawn through the gauze at the same time, the latter making an effective trap for most of the dust and foreign matter, with the result that the supply of mixture was quickly choked."

#### To Prevent Mud-Streaks on the Body.

For the sake of preserving the finish on the sides of the body, cars which are not equipped with weather strips between the running boards and the frame sides should be provided with leather cheeks for this purpose, such as readily can be contrived and installed. The cost is comparatively slight and the resulting protection practically ensures the tonneau doors and side panels from those mud-streaks which so quickly mar the finish, even when the body is given the best of care.

## PACKARD SHEDS ITS OLD BODY

**Adopts a New One of Torpedo Type—The 1911 Line and Some of its Characteristics Made Public.**

Abandoning to a certain extent the practice which it has adhered to for several years of affording the least possible distinction between the cars produced one year and those of the next succeeding vintage, the Packard Motor Car Co., of Detroit, Mich., in announcing its plans for the 1911 season discloses its purposed adoption of a new style of body design and a new color scheme. Thus while the structure of the two types of chassis produced will remain much as heretofore, the exter-

iors of  $\frac{1}{2}$  inch smaller size in front than in the rear.

Such mechanical alterations as have been made are in the nature of detail improvements, it is said, and they are extensive; their exact nature, however, is not disclosed. The "thirty" motor has cylinder dimensions of 5 by  $5\frac{1}{2}$  inches, bore and stroke, while the "eighteen" motor has a bore and stroke of 4 1-16 by  $5\frac{1}{2}$  inches. Both motors, which correspond in points of general design, develop their rated outputs at speeds of 650 revolutions per minute. Such characteristic mechanical features as the hydraulic governor system on the carburetter, the Eise-mann magneto ignition with separate transformer coil, the automatic lubricating system, dry plate clutch and axle-mounted change gear set are retained without significant alteration. These features appear

NEW PACKARD FORE-DOOR STYLE TOURING BODY

nals of the vehicles produced from now on will be decidedly at variance with that which has prevailed hitherto.

As the accompanying picture shows, the new style body partakes in a general way of the general class of torpedoes; but it is designated as the "fore-door" type. It is pointed out that it differs from the regular torpedo in that the front and rear body panels are made in strong relief, while the general lines are suggestive of the victoria. The new colors will be Packard blue with gray striping as to the body, black as to the frame, fenders and similar parts, while the running gear will be gray striped with black.

The complete line applied to the "thirty" chassis will consist of a touring car, phaeton, close-coupled car, runabout, limousine, fore-door limousine and fore-door landaulet—the two latter being distinguished by the complete enclosure of the front seats. The smaller "eighteen" chassis will be produced as a five-passenger touring car, close-coupled, runabout, limousine and landaulet similar to the larger patterns. Tops will be included in the standard equipment of the open cars, as will Continental demountable rims, in addition to other and standard equipment. In the new models, the tire sizes will be, respectively, 36 by  $4\frac{1}{2}$  inches and 34 by 4 inches, front and rear, instead of the present specifications, which call for

on both models, which, in fact, practically are duplicated in everything but power and size.

#### Care Required in Dismounting Magneto.

Magnetos which are driven by an auxiliary motion shaft which is fitted with a universal joint of the Oldham coupling type, should not be dismantled until the floating key of this member has been plainly marked, together with a least one of the corresponding flanges on the shaft sections. This will enable it to be reassembled in exactly the same way that it stood before dismantling. Through an apparently inconsequential irregularity in the formation of the parts, a reversal of the keypiece might result in causing the shaft to bind, thus straining it, and possibly in some way affecting the electrical output of the magneto.

#### Why Body Bolts Require Attention.

While there is small chance for the bolts which hold down the body to become loose, so long as they are held properly by means of spring washers, still it is well to inspect them from time to time in order to make sure that they are well secured. Should the nuts become lost, or the bolts be sheared off through any shifting of the body, there is some chance that the body may work out of place in one way or another, thus causing a serious accident.

### ADVANTAGE OF LARGE TIRES

Old Subject Discussed from New Standpoint—Table Showing Relation of Tire Area to Car Weight.

Although every driver of a motor car has a fairly clear idea of the relation between tire sizes and their wearing qualities, few know exactly how to determine for themselves by pure calculation the factor of tire wear. To the great majority, therefore, the statistics compiled by the Franklin Mfg. Co., of Syracuse, N. Y., will be helpful in showing just how the wearing qualities of a tire, aside from all questions of quality of the material used, are determined by calculation. From these figures it appears that the superficial area per pound weight of car varies from a maximum of 2.04 inches for every pound of car, in the case of one of the Franklin models, down to a minimum of 1.23 square inches per pound in one model cited which is of a different make.

In a general way it may be said that the wear of a tire is fairly uniform around its circumference, because the many little skids and slides caused by braking are distributed over the whole surface during an extended period of use. Since a blowout is caused by either a sudden weakening of the envelope or a sudden increase of internal pressure, it is important that the tire size be such that this wear shall be distributed over a large area. The increase in surface area must be obtained by an increase in the diameter of the wheel, as the part of the tread in actual contact with the road is but very small. The cross section of a tire also should be large, in order that the sudden increase of internal pressure due to the plunge of the car when meeting an obstruction will be distributed over a large area. It is clear that a tire with a cross section diameter of 5 inches has a much larger inside surface area proportionately than one of only 4 inches—namely, in the proportion of 25 to 16. A larger wheel diameter also is preferable, for then the force of the pressure will be distributed over a much larger area.

The standard for comparisons of tire equipment on a motor car may be taken as the superficial area of the entire tire. For a convenient unit a square inch can be used. Since the wear on the tire, or an increase of pressure on it is to the greatest extent caused by the weight of the car, this standard may be considered as the number of square inches of tire area per pound of car weight in full touring trim, exclusive of passenger weight. This standard, from specifications of a number of tire manufacturers, requires 1.7 square inches superficial area per pound of car weight. Several well known makes of car average from 1.4 to 1.7 square inches per pound. In Frank-

lin cars the margin of safety is 2.04 square inches of tire for every pound of car weight.

In a table made up by the Franklin Mfg. Co. the features of various Franklin models in respect to tire sizes are contrasted with those of eight other well known cars, as follows:

Model	Passenger capacity	Car weight fully equipped	Tire sizes	Total tire area	Tire area in sq. inches per lb. car weight
G-T	4	2,000	F. 32x3½ R. 32x4	4,172	2.03
D-T	5	2,600	F. 36x4 R. 36x4½	5,326	2.04
H-T	7	3,100	F. 36x4½ R. 37x5	5,860	1.93
Other Makes.					
A	5	3,300	F. 36x4 R. 36x4½	5,320	1.61
B	5	3,600	F. 36x4 R. 34x4½	4,996	1.39
C	5	3,600	F. 36x4½ R. 36x4½	5,600	1.55
D	5	2,700	F. 34x4 R. 34x4	4,752	1.76
E	5	2,840	F. 36x3½ R. 36x3½	4,492	1.60
F	7	4,100	F. 36x4 R. 36x4	5,040	1.23
G	5	3,775	F. 36x4 R. 34x4	5,040	1.35
H	7	4,175	F. 42x4½ R. 42x4½	6,648	1.60

### The Care of Planetary Gears.

On account of the difficulty experienced by most learners in mastering the art of properly handling the gear change of the sliding pinion type, it should become an established practice with agents and dealers to see to it that cars undergoing the ordeal of the instruction period are subjected to frequent overhauling. In particular, it should be seen to that the gear boxes are thoroughly cleared of all oil or grease, and flushed out with kerosene oil. Otherwise certain small particles of hard, chipped metal from the gear teeth are pretty apt to find their way into the bearings, to the ultimate sacrifice of their good condition.

In many respects nothing could be superior for the small and medium sized car than the planetary type of change speed gear. At the same time, the success of this mechanism depends absolutely upon the way in which it is maintained. It is all-essential that it be kept filled with a proper amount of clean lubricant of the proper consistency, and that the brakes which are used to bring the low and reverse drives into action are so adjusted as to give good contact when brought into action, yet so as not to drag when out of engagement. To this end a certain amount of lubricant should be used under the bands, yet not enough to prevent the brakes from being forced down into good contact with the metal of the drum when required.

### THE BRIGHT SCHEME THAT FAILED

Being the Story of a Dealer with Expansive Ideas—How They Led to the Bankruptcy Court.

Influenced by the abounding optimism which prevails in automobile selling and spurred to large deeds by the exploits of others, not a few venturants into the field greatly have overreached themselves and have contributed to their own rapid ruin by serious mistakes of policy and method. As an example of the energetic but overly ambitious attempt to be a "distributor" of cars in a large way, the case of a dealer in one of the largest cities is cited by a shrewd trade observer, who is familiar with all the circumstances attending the dealer's downfall. The case is one which has suggestive lessons for others who may be tempted to "bite off more than they can chew" and who entertain visions of being "distributors" when they lack the capital and the organization to be successful in that role.

"Through an association with the automobile business and the men in it," said the narrator, "the chap I have in mind got the itching to become a dealer on a large scale, so that he might harvest some of the apparently easy money. He therefore threw up a good position to embark in the automobile business for himself, securing a large slice of territory for a car made in the Middle West and selling around \$2,000.

"Being able to command quite a little ready cash, he plunged to the extent of binding himself to take 200 cars. The manufacturers expressed cautious doubts about his being able to handle so many, but he overcame their objections by painting highly colored pictures of his own selling ability and a waiting market for the cars, that was ripe for the picking. His next move was to hire a moderate sized but expensive salesroom on Automobile Row.

"Before he was really well settled and had had time to get a string of prospective buyers to work on, the cars began to arrive in embarrassing quantities. Following out a brilliant scheme that he had in mind all along, he began placing cars on consignment with a number of dealers in the surrounding small cities and towns. To these dealers he offered a straight 15 per cent. commission on all of his cars that they would sell, and he urged them to make free use of the demonstration cars which he left with them. He figured his own profit out of the fact that he was getting a little more than 20 per cent. for himself, from which the suburban dealer's 15 per cent. would come.

"Is it hard to imagine what those kind-hearted suburban dealers did, under such a free-and-easy arrangement? It does not require much imagination to guess. They

took him at his word and used his demonstration cars freely—indeed they did! One or two of the more conscientious ones kept the cars standing in the exhibition room without harm for the first few weeks, but after he had visited them a couple of times and had taken them to task for not using the cars to give demonstrations to customers, they, too, began to put the cars into actual road service.

"In addition to using them for night joy riding and for lending to their friends, the cars sometimes were rented out by the suburban dealers. In fact, the machines were called upon for all kinds of service where the dealers wanted to save their own cars from wear or damage, and were used frequently for towing jobs and errand work.

"Not only that, but as most of these dealers were themselves agents for cars selling for from \$1,000 to \$1,500, and on which they made more than 15 per cent., the cars which the would-be distributor so kindly left with them served as excellent foils for comparison. The dealers would tell their prospective customers that while they handled the \$2,000 car, they nevertheless would recommend the \$1,500 car as being just as good, and the customers would be impressed with their honesty, thinking that the dealers were willing to take a smaller profit in order to give customers the better bargain.

"It took about three months for the situation to become so acute that the free-handed distributor awoke to where he was at. The cars from the factory were still arriving, and his capacity for paying for them was exceeded. He canvassed his suburban dealers, to find out what they had done and to gather in some money, and was dismayed to find that not one of them had disposed of a car for him.

"To his vigorous exhortations they merely shrugged their shoulders and, pointing to the now more or less worn and dilapidated demonstration cars, told him to take the machines away, as they did not believe they could sell them. From this point on things moved quite rapidly. The comparatively few cars that he himself had sold at retail gave him hardly little more than enough to pay the expenses he had incurred in his Automobile Row headquarters. The only cars he could turn back to the manufacturers were sadly used up, and he was 'in bad' all around. He was closed out, the manufacturers and his friends made the best they could out of the wreckage, and his career as agent and distributor was over."

#### Cold Water for Preserving Finish.

Sprinkling all varnish work of a new car with clean cold water is recommended as a method of preserving the finish. The effect of chilling the varnish is to harden it, so that dust and mud will be less likely to cling to it than would be the case, particularly if the car happens to be given its maiden trip on a hot day.

## MOTORING AS A CATARRH REMEDY

### New York Physician Testifies that it Cured His Own Chronic Case—Specialists Had Failed.

While several physicians recently have stated that under certain conditions the automobile is an important factor in assisting convalescence, and in benefiting in a therapeutic way those who have sedentary occupations, their remarks usually have been more general than specific and only expressed opinions formed upon second-hand information. But there is one doctor who owns a motor car himself, who asserts that the driving of this car cured him of chronic nasal catarrh of many years' standing, after most of his own knowledge of medicine, and that of the best specialists, had failed to give him relief from the distressing malady.

"It so happens," writes Dr. Samuel A. Visanska, of New York City, N. Y., "that early last fall I purchased an automobile to replace my old 'buggy,' which I had often found a trial in many ways. I soon began to really enjoy my new vehicle and ceased to dread the long trips to suburban points which had heretofore been something of a bugbear. At first I thought this enjoyment was mainly because of the time I would save and the rapidity with which I could now dispatch all my calls for the day. Before long, however, I began to realize that my pleasure in my automobile trips was due to another reason as well. For many years I have been a sufferer from nasal catarrh, but after using my automobile in all kinds of weather for a few months I find myself really cured of this ill. Heretofore, during the winter seasons I have had the treatment of our best specialists, and one winter I was forced to seek the milder climate of Florida, in order to get some relief from this most distressing ailment. To-day I cannot detect a trace of the former obstinate trouble, and hence I am enthusiastic about my condition, and as the driving of my automobile on fair days and dark days, in rain or snow, in sleet and sunshine, is the only marked change in my habits, I am literally forced to attribute the improvement of my physical condition to this one source.

"Of course, this is but the limited experience of only a single instance, but its value lies in the plausibility of such a cure as it appeals to my reason. In fact, so logical does it seem that I believe I can even go further and assert that the continued use of the automobile would prove a curative instrument in all cases of catarrh of the nasopharynx as well as chronic bronchitis, and even for pulmonary tuberculosis.

"If we consider the reasons for this belief their force seems more and more con-

clusive. In the first place, while using an automobile the patient gets more air and purer air than under ordinary outdoor conditions; also he takes deeper breaths and more continuously fills the entire lungs and nasal passages with pure air than under any other conditions of which I know. He does this unconsciously, too, and without apparent effort. When we add to this fact the exhilaration of the motion and consequently improved circulation of the blood engendered by automobile riding, together with the sense of diversion and pleasure which the patient experiences during this process of deep breathing and lung expansion, we have almost an ideal condition for the cure of the dreaded and deadly ills of the respiratory system.

"For children the 'auto cure' is especially desirable, for they can seldom be induced to 'breathe deeply' for any length of time, while, as has been said, during the progress of an auto ride this process is absolutely automatic. Hence with our present knowledge of the benefits of outdoor sleeping and the increased popularity of the automobile, we are, I verily believe, in a fair way to rid ourselves even of the great white plague, and in a novel, delightful and altogether practical way."

#### Visitors Exempt from French Tax.

Although the cabled reports of the new automobile tax levied in France upon transient motor cars emphasized the severity of the assessments and made appear that it would bear heavily on tourists, it transpires that the cables were greatly exaggerated. Complete translations of the officially published wording of the measure, while showing a substantial increase in the tax levied, make plain that cars which are in the country less than four months are wholly exempt. The following translation of the measure is published in the "Journal Officiel":

Automobiles imported into France for temporary residence and which do not pay the direct tax, will be subject to the following taxation:

Fixed tax for a period of 360 days:

Cars with one to two seats..... 50 frs.  
Cars with over two seats..... 90 frs.

Plus a tax upon the horsepower per horsepower or fraction thereof:

1 to 12 horsepower..... 5 frs. per h.p.  
13 to 24 horsepower..... 7 frs. per h.p.  
25 to 36 horsepower..... 9 frs. per h.p.  
37 to 60 horsepower..... 12 frs. per h.p.  
61 horsepower and over ..... 15 frs. per h.p.

These taxes will be collected proportionally to the stay in France per month, any part of a month being taken as a whole month.

Cars whose consecutive stay in France does not exceed a period of four months will be free of above taxes. The original reports of the measure made it appear that for an American to take a car over to France for touring purposes would expose him to heavy assessment, but the 'four months' exemption removes that possibility.

## FOR PREVENTION OF BACK-KICKS

Ingenious but Simple Device that Serves the Purpose—How it is Applied and How it Operates.

Recognizing the need of some sort of appliance to safeguard the hand and arm of the operator when starting the motor, manufacturers long have been on the lookout for devices suitable for this purpose. Nevertheless, accidents resulting from back-kicking engines have continued to multiply, until the latest figures given out by the International Association of Accident Underwriters show that practically one-half of the accidents which motorists suffer arise from this one cause. Hitherto, most of the safeguards applied have been in the way of arrangements to prevent the starting crank from being engaged until the ignition mechanism had been retarded. In the new system which has been adopted by the American Locomotive Co., of New York City, however, a releasing device is fitted to the crank itself, so that in the event of a back kick it releases automatically.

The device, which is the invention of William R. Webster, a Philadelphia consulting engineer, and which is now being applied to the entire line of Alco cars, consists of a simple mechanical trip mechanism attached to the ordinary starting crank in such a way that it will disengage it from the crank shaft in the engine is reversed.

As the accompanying illustrations show, the amount of motion which is necessary to effect the release under the unusual condition of a back kick is very slight. The first picture shows the starting crank in its normal position. In the second it is shown in the position at which it would be released from the crank shaft were the engine reversed. Externally there is nothing to indicate the addition of the device to the car save the small collar which surrounds the starting shaft close up under the radiator.

As a matter of fact, the appliance consists of but three parts. Pinned directly to the shaft is a collar which constitutes part of a ratchet which turns freely when the handle is rotated from left to right, as in starting the engine, but which locks when the handle is moved in the opposite direction. Outside the first collar and fitting it loosely is a second collar, which engages the first part when in reverse movement, owing to the action of a ball pawl. On the inner face of the second part is a cam surface which is adapted to engage with the supporting bracket, which forms the third essential member of the device, and which limits its travel in the backward direction, owing to the shape of the engaging surfaces.

When the starting handle is engaged with

the crank shaft in the regular way, the lug on the bracket is in contact with the cam face on the intermediate piece at its lowest point. Forward motion of the shaft does not affect this relation in any way. But if the movement of the engine is reversed,

ALCO SAFETY STARTING CRANK.

the intermediate piece at once is clutched to the collar surrounding the starting shaft, which, in turn, causes the cam face on the intermediate member to rotate in contact with the finger on the bracket. This movement, in the very small angle which is

RELEASE POSITION OF CRANK.

shown by the pictures, causes the starting shaft to make sufficient longitudinal movement to disengage the main ratchet, thus releasing the crank from the engine. Such is the position of the release mechanism with relation to the engine cranks that it is thought to be practically impossible for any injury to be received.

## MOTOR CARS INSTEAD OF OX-TEAMS

Consul in Mexico's Great Coffee District Points to an Opening—Feat of First Automobile.

American automobile exports to Mexico have been increasing steadily during the past two years, and already have passed the half million dollar mark. That there are, however, many opportunities hitherto neglected is clearly shown by the report of Consul Albert W. Brickwood, stationed at Tapachula, in the state of Chiapas, Mexico. Particularly the transportation of freight offers inducements to American firms desiring to enlarge their foreign trade.

"On February 16, 1910," writes the consul, "an American automobile made the first automobile trip in the States of Chiapas, accomplishing a run of over 80 miles in 5¼ hours from Jalisco, a station on the Pan-American railroad, to Tuxtla Gutierrez, the capital of the state. Some portions of the road need repairing, and there is no doubt that with the road rehabilitated the run can be made to Tuxtla Gutierrez and back to Jalisco in one day, with several hours' stop at either end, as against the present dilatory trip by coaches of three days, averaging seven to eight hours as a day's journey, with all consequent inconvenience. The mail at present is carried from Jalisco to Tuxtla Gutierrez in light carts, in about 30 hours, with delays in the rainy season. The towns are strategic points for the state, are dependent at the present time on the antiquated ox carts for their freight and for commerce, entailing the necessity of ordering in advance from 6 months to a year, if the merchants wish to maintain well-stocked establishments. The congestion at Jalisco at times reaches 300 tons and more.

"There is little doubt that once the state government were convinced of the vast possibilities through developing the district alluded to, no difficulty would intervene in obtaining monetary concessions for mail service that would make it worth the while of any company to introduce an automobile service for passengers and particularly for freight.

"It would well repay American firms wishing to enlarge business to send down experts to look over the country. Automobile wagons for hauling freight, coffee, rubber and other products and merchandise to and from town, railroad station and plantation, could also be used to great advantage in the principal towns on the Pan-American railroad, and especially in Tapachula, the seat of the coffee district of Soconusco.

"Light runabouts, if exhibited and their capabilities proved, undoubtedly could be sold to many, to be utilized in trips between plantations and towns."

## WHAT TO DO IN CASE OF ACCIDENT

### Continued Exposition of First Aid Principles—Treatment of Fractures and Precautions to be Observed.

Were a compilation of accidents possible it doubtless would be found that in a summary of the various forms of injuries possible, fractures should be found far more numerous than any other kind of hurt. This especially is true in the case of automobile accidents, and it therefore follows that every automobilist should know how to treat a fracture, should he at any time be called upon to treat such an ailment.

To properly construct a bandage is the most important essential in the treatment of fractures, and this knowledge is called into requisition more often in the case of fractures than in any of the various forms of injuries that have been described in two previous issues of the Motor World.

#### Fractures.

Briefly described, a fracture is a breaking or solution of continuity in a bone, and the general classification of fractures are simple, compound, comminuted, multiple and complicated. In a simple fracture, the bone is broken into two fragments, but does not protrude through the surrounding muscular tissue, the skin being uninjured. In a compound fracture the bone is exposed to or communicates with the air by a wound of the soft structures. In a comminuted fracture the bone is broken or crushed into a number of pieces at the same point, and communicate with one another. In a multiple fracture the bone is broken into a number of pieces, but at different parts of the bone, and do not communicate with one another. In a complicated fracture there is, in addition to the breaking of a bone, an injury to some important adjacent structure, resulting from the fracture, as blood vessels, nerves or joints.

A fracture is either complete or incomplete. A complete fracture is the usual variety, and involves the entire separating or loss of continuity of the bone. An incomplete fracture does not involve the entire separation of bone, and frequently occurs in children, owing to the elasticity of the bone in early life, and has received the name "green-stick" fracture. The direction in which the bone is broken is indicated by the terms transverse, oblique and longitudinal. An impacted fracture occurs when the broken ends of the bone are driven into each other, and remain thus fixed.

The signs and symptoms of fracture are: Deformity, abnormal or increased mobility, or, as it is sometimes called, false point of motion; bony crepitus, pain, loss of function and subsequent swelling and discoloration of the injured part. The deformity is

caused by the displacement of the ends of the broken bone, as the result of the violence causing the injury; also the muscular contraction at the affected part, and attempted movement on the part of the patient, which causes a shortening and change in the direction of the limb, and considerably deformity at the seat of injury. The deformity, as a rule, is not particularly apparent in impacted fractures. Abnormal mobility is the result of the solution of continuity or break in the bone, producing a "false point of motion," which is detected while manipulating the part. Crepitus is caused by the rubbing together of the ends of the broken bone, and, when detected, is a positive sign of fracture. It is absent in impacted fracture, and also where muscle or other tissue have fallen between the ends of the bone; consequently, an absence of crepitus does not necessarily mean an absence of fracture. Pain is caused by the contact of the fragments of the broken bone with the adjacent structures, also the strong muscular contraction that occurs at the seat of injury. More or less heat, redness and discoloration of the part may or may not be present. Loss of function is the inability on the part of the patient to make use of the injured limb. The swelling and discoloration are due to the subcutaneous escape of blood and serum at the seat of fracture.

The repair, union or knitting of the bone is begun by Nature soon after the occurrence of a fracture, and is accomplished by a substance formed at the seat of injury, known as callus, which is thrown around and between the ends of the broken bone. Although soft at first, the callus gradually hardens, and at the end of varying periods, depending upon the bone injured, but not usually exceeding six weeks, the fragments are firmly united. The minute structure of callus becomes in time (about a year) similar to that of bone. Sometimes the formation of the callus is imperfect or insufficient, and the broken bone does not become united. This condition constitutes an ununited fracture. The popular belief that the pain is much greater while the knitting process is going on is absolutely without foundation.

#### Treatment.

The object of the surgeon in treating a fracture is simply to assist Nature. He first carefully reduces or sets the fracture—that is, he tries, as far as possible, to bring the broken ends in opposition or directly against each other, and by retaining them in position for a certain length of time by splints or some other form of support, the permanent union is effected by the callus, and the function of the part generally restored. Although it is best that a fracture be reduced and the proper dressing applied as quickly as possible, it should be remembered that the union of the fragments does not begin for some time after the injury

has been received, and that a fracture may remain several days before being reduced, and be still followed by very good results; and that a frequent cause of compound fracture is the outcome of unskilful manipulation. Consequently when one not a surgeon is called upon to attend a person where a fracture is suspected, his duty consists in protecting and making immovable the injured part, and conveying the patient to a hospital, or wherever he can receive the necessary and proper treatment. However, should this be impossible, as the result of the accident having occurred where the professional services cannot be obtained for an indefinite period, an effort may then be made to reduce the fracture, but the manipulations are to be made only with the greatest care.

As a rule, the injured person should not be moved from the position in which he is found until an examination has been made as to the character of the injury. A violation of this rule is very often the cause of a compound fracture. If the injury is about the ankle or wrist, it can easily be exposed; however, if the injured part is nearer to the body, the clothing should be cut away, and not removed in the ordinary way, which would be likely to disturb the fragments and increase the suffering. The different garments need not be needlessly cut, but, if possible, ripped at the seams. If a fracture has occurred, an examination will probably show one or more of the ordinary symptoms already described. If the necessary surgical attendance can be secured within a number of hours, the splints should be applied without an attempt at reducing the fracture. Otherwise an effort in this direction is justifiable.

The reduction of a fracture consists in bringing the ends of the bone together, and is accomplished by extension and counter-extension. The term extension, when applied to the treatment of fracture, indicates the procedure whereby the broken limb below the seat of injury is pulled from the body. In counter-extension, the upper fragment, or the portion of the broken bone nearest the body, is held securely in position, or is carried in an opposite direction from the lower fragment. This manner of reducing a fracture is performed by the hands or an instrument devised for the purpose. The hands are generally used, however. The extension and counter-extension should be made in a straight line—that is, in the long axis of the broken bone.

After the seat of injury has been examined and the presence of fracture ascertained, the clothing that was previously turned aside can now be replaced and wrapped around the injury, thus affording quite a protection to it. The splint should now be applied, and the patient removed to a place where he can receive the proper treatment.

When the fracture is compound, no effort should be made to apply splints until

the wound has been covered as quickly as possible with an antiseptic material or some form of clean dressing. If a blood-clot fills the wound it should under no circumstances be removed until the patient is in the hands of a surgeon. The protection of such a clot prevents the entrance of poisonous germs into the system. If a portion of the broken bone protrudes through the skin, no attempt should be made to remove it, but the dressing applied as before stated.

Splints can be made of any material which is capable of rendering the part immovable without injury to the soft tissues to which they are applied. They should be long enough to extend above and below the injury, and generally including the nearest joint, and in some cases two or three, as in a case of fracture of the thigh. Their diameter should exceed that of the limb, although this is not absolutely necessary, as a sword or cane makes a very good splint. Two splints are generally used—one for the inner side and one for the outer side of the limb. Splints should always be padded on the side next the skin, so as to prevent undue pressure and injury. After a splint has been fitted to a limb, it should be retained by the necessary bandages; they should not surround the limb at the point of fracture, nor should they be drawn so tight as to increase the suffering.

Thin boards are considered the best for splints (at least, temporary use), being light, and easily formed to suit special occasions. Other things may be used, however, with very good results. Among those which can be secured in emergencies are shingles, cigar boxes, laths, barrel staves, bark and branches of trees. Book covers, sole leather, newspapers tight wrapped, canes, umbrellas, broomsticks, straw and other such materials may also be used. A folded coat, or any article of clothing, or a pillow makes a very valuable temporary splint and pad combined, and is particularly useful in fracture of the leg.

For padding, any soft substance—cotton, oakum, furniture stuffing, straw, hay, moss, grass, leaves, etc., may be used. Bandages for retaining the splint may be formed of handkerchiefs, neckties, suspenders, strips of clothing, straps, green twigs, rope, cord, wire, etc. Care should be taken when using such things as cord or wire that the skin be well protected, so as not to cut or injure.

Fractures of the cranial bones are usually followed by symptoms of concussion or compression of the brain. A fracture occurring at the base of the skull is usually caused by a blow about the forehead or opposite the point of fracture, or by a fall from a height, the person striking on the head or upon the feet, and has, in addition, special symptoms which point directly to this form of injury—viz., an escape of blood from the nose and ear, and beneath the thin membranes covering the eye; or, what is still more positive, an escape of a colorless fluid from the ear. The patient should

be placed on his back in a cool, dark room and kept perfectly quiet. Cold, in some form, should be applied to the head, to prevent excessive reaction. For the same reason, the internal use of stimulants should be avoided.

Fracture of the inferior maxilla (lower jaw. The body of the bone (the portion into which the teeth are inserted) is the usual seat of fracture, which is generally compound, having a communication with the cavity of the mouth. The deformity is shown by the irregularity of the teeth on the affected side. Crepitus, swelling, dripping of saliva, and bleeding from the mouth are also generally present. The teeth should be brought together, thus allowing the superior maxilla (upper jaw) to act as a splint. A four tailed bandage (described later) should then be applied to retain the parts in this position.

Fracture of the spinal column should be suspected when, following an injury to the back, there appears more or less paralysis below the point of injury as a result of pressure upon the spinal cord. The ordinary symptoms of fracture are not usually present nor should they be looked for, as an effort made to elicit crepitus, etc., may result in further injury to the spinal cord. The patient should be allowed to assume a position which is most agreeable to him (preferably lying down), provided he does not lie face downward. An ice bag, or some form of cold, may be applied to the seat of injury and perfect rest enjoined. If it is absolutely necessary to move the patient, care should be exercised not to allow any movement of the spine. The after treatment, which consists of efforts to adjust the fragments of the injured bone and to prevent subsequent inflammation and injury to the spine, and to reduce the paralysis, should be attended to only by the surgeon.

Fractures of the ribs are caused by direct violence as the result of a fall or blow or being subjected to severe pressure, as in a crowd or great muscular contraction. The seat of fracture is usually between the third and eighth ribs. The floating ribs (eleventh and twelfth) are rarely broken, owing to their single attachment to the vertebral column, which allows sufficient freedom whereby to escape injury. Embarrassed and shallow breathing, accompanied by a sharp or lancinating or stabbing pain at the injured part, or a "stitch in the side," is usually complained of. Crepitus is sometimes detected by placing the hand or the ear against the injured side, and then having the patient take a deep breath or cough. It is uncommon to find an external evidence of a fracture, and great care should be exercised in the examination so as not to cause greater injury. A broken rib may be followed by serious consequences, as an injury to the lung, which would be evidenced by shock, spitting of blood, and, in some cases, a crackling sensation when the hand is carried over the skin at the seat

of pain, due to presence of acid under the skin. The treatment consists in limiting the action of the affected side as much as possible. This is met with by the application of bandages or adhesive plaster. A triangular bandage, folded in the form of a cravat and bound snugly about the chest, would answer for a temporary dressing. A flannel or muslin bandage about three inches wide and made to circle the chest would be much better, however. At the present time the most effective means of treating a fractured rib is by the use of adhesive plaster, applied either entirely or two-third of the way around the chest, as follows: Strips of plaster one and a half or two inches wide and sufficiently long to surround the chest are prepared. The strips are heated and then applied firmly around the chest from above downward, following as nearly as possible the course of the ribs, each strip overlapping the lower third of the preceding one. The space covered by the strips should be about eight inches in width. Or, for example, if the fracture is on the right side, the adhesive may be first applied about four inches to the left of the spinal column, and carried around the right side of the chest to about the same distance to the left of the breast bone, thus restraining the action of the injured side without materially affecting the opposite one. In the use of bandages or the plaster already described it is very important that they (especially the plaster strips) should be applied at the end of the respiration, as at this time the chest is smallest in size and the broken fragments are brought closer together. Care should be taken that the application does not seriously interfere with the breathing. This treatment may also be used in severe contusions of the chest.

Fracture of the clavicle, or collarbone, is more frequent than any other bone in the body. It is usually caused by an indirect violence, as the falling upon the shoulder. It will be remembered that the collar-bones hold the shoulders upward, backward and outward. Thus the deformity following injury to this bone would be drooping of the shoulders downward, forward and inward with some changes in the outline at the site of the fracture. The patient may be laid down, with a pillow between the shoulders, or, if he is to be removed, the following temporary support may be used: A soft pad is placed well up in the axilla, or armpit, the forearm being laid against the chest and the shoulder raised by pressing the elbow upward, and held in this position by an assistant or by the patient himself, until the following support is given: A triangular or Esmarch bandage, folded in the form of a cravat, or a long strip of cloth, should be placed under the elbow and one end carried upward, across the chest, and the other across the back, and the two ends fastened over the opposite shoulder. A similar bandage is then placed against the outside of the arm, or the in-

jured side, and the one end of this bandage brought across the chest and the other across the back, the ends then being fastened under the arm of the opposite side. For example, we will say that the right clavicle is fractured. The left forearm is brought across the chest, a bandage is placed under the elbow of that arm and the ends fastened over the left shoulder. Now a second bandage is placed about the right arm just above the elbow, and the ends tightened under the left armpit.

Fracture of the scapular (shoulder blade) very rarely is met with, and is the result of direct violence. The signs and symptoms are not very marked, due to the thick covering of muscular tissue. In a suspected fracture, the arm of the opposite side should be placed in a sling and kept quiet by the side of the chest.

#### What Caused the Puncture Epidemic.

Business simply swamped the automobile repair shops in the Tonowandas, N. Y. on Thursday last. The immediate cause of this sudden rush to the garages was a combination of small boys, a junk dealer from Buffalo and a load of tin brads. The junk dealer bought a wagon load of the tin brads at the Niagara Radiator Co.'s plant on Oliver street, North Tonowanda, N. Y. The boys could not let such a good opportunity pass, climbed into the wagon and proceeded to scatter the brads by the hand-

ful all along Oliver street. As this street is very popular with motorists, it was not very long before a number of automobiles suffered punctures, some of the cars picking up half a dozen of the brads before the first puncture was felt by the driver. The department of public works had to be called in to remove the brads that had not been picked up by tires.

#### When Commission Sales Become Larceny.

That it is larceny to fail to return an automobile within a reasonable time, when commissioned to sell it, is the opinion of a jury in the Kings County (N. Y.) county park. George Salzman had been asked by Tom Sharkey, the pugilist, to dispose of the latter's automobile on commission. The machine was stored at Sheepshead Bay, and on February 3 Salzman took it out and failed to come back with it. When arrested some two weeks later he claimed to be looking for a purchaser. The jury refused to believe him and found him guilty of the larceny of \$2,800, the value of the car.

#### When Automobiles Are not Junk.

That automobiles, even if temporarily out of order, cannot be classed as junk, is the dictum of the chairman of the finance committee of the Chicago City Council. The trouble originated in an order from the comptroller to all department heads asking that they report all "junk," so that it may

be advertised and sold to the highest bidder. The Fire Department then reported an automobile, which at present is in the repair shop. Chairman Snow is quoted as having asked the official concerned to take a look at a dictionary and find out what "junk" really is.

#### Startling Method of Obtaining a Joy Ride.

Holding up a garage employe in order to obtain a "joy ride" is the latest "stunt" reported from Salt Lake City, Utah. The nightman at the Sharman Automobile Co.'s garage was ordered at the point of a revolver to throw up his hands, then tied to a post and gagged, after which precaution the lone highwayman jumped into the finest car available and drove away. Six hours later the abandoned car, with a broken rear wheel, was found by the police at a street corner.

#### Fines Squeezed Out by West Orange.

How great the income of some communities from automobile fines amounts to is shown by the report from West Orange, N. J., that on Sunday last Justice Condit collected fines aggregating \$325 in the space of an hour. The violators of the speed law were arrested on the road on top of Orange Mountain, where a fine road about a mile long tempts drivers to make fast time. Five of them paid \$50 each and one had to pay \$75.

## RECENT PATENTS.

954,359. Carburetter and Controller for Internal Combustion Engines. John L. Tate, Jersey City, N. J. Filed Jan. 21, 1909. Serial No. 473,432.

1. In combination, an internal combustion engine, a dynamo driven thereby, a motor, electric connections between said dynamo and said motor, and a coil included in said connections for heating fuel for delivery to the engine.

954,434. Means for Suppressing the Resistance of the Negative Electrode Flame in Electric Vapor Apparatus. Peter C. Hewitt, New York, N. Y., assignor, by mesne assignments, to Cooper Hewitt Electric Company, a corporation of New York. Filed March 21, 1902. Serial No. 99,333.

1. In a vapor electric apparatus, a container of suitable shape and dimensions, a positive and a negative electrode therein, and means for causing the surface of the negative electrode at which the current enters it to lie in a plane at an oblique angle to the path of the current between the two electrodes whereby the flame is caused to project itself out of the path of the current.

954,453. Transmission Gearing. Arthur J. Morse, Torrington, Conn., assignor to Connecticut Motor Vehicle Co., New York, N. Y., a corporation of New York. Filed June 6, 1907. Serial No. 377,596.

1. In a motor vehicle, the combination with an engine shaft running continuously in one direction, a drive shaft for propelling the car, and means introduced between said shafts for propelling the car at any speed up to the maximum of that of the engine shaft or in either direction at the will of the operator, said means comprising a flywheel driven with the engine shaft, means for connecting one of said gears with the drive shaft, and means co-operating with the engine shaft for causing said gears to rotate on their axis.

954,488. Carburetter. Austin M. Wolf, New York, N. Y. Filed May 26, 1909. Serial No. 498,519.

In a carburetter, a float chamber, a mixing chamber passing immediately adjacent said float chamber and separated therefrom by a wall, said wall forming a cover to said float chamber, a valve in said wall establishing communication between both said chambers, and an adjustable cock in said cover admitting atmospheric pressure to said float chamber, as described.

954,491. Carbon Remover. Robert Zastrow, Racine, Wis. Filed Dec. 6, 1909. Serial No. 531,542.

1. A carbon remover for explosive engines, comprising a guide shaped to fit in an opening in the end of the engine cylinder, a stem passing through the guide eccentric thereto and adapted to turn therein, and a scraper blade carried by the end of the stem to be moved over the surface of the piston of the engine by the turning movements of the stem.

954,531. Transmission Mechanism. John M. Mack, Allentown, Pa. Filed April 28, 1906. Serial No. 314,226.

1. In a transmission mechanism, the combination with a driving shaft, of a jack-shaft, a series of gears fixed thereon, gears arranged at the end of said driving shaft, and said jack-shaft meshing with each other, a bevel gear adapted to rotate with the gear

of the driving shaft, a counter-shaft, a bevel gear thereon in mesh with the bevel gear aforesaid, a clutch on said jack-shaft normally engaging the gear arranged at the end thereof, a series of gears loosely mounted upon said driving shaft in mesh with the gears fixed upon the jack-shaft, clutches arranged upon said driving shaft, and means for releasing the clutch of the jack-shaft as one of the clutches on the driving shaft is shifted into operative position, and engaging the clutch of the jack shaft as the remaining clutches of the driving shaft are severally shifted into operative position, substantially as specified.

954,630. Carburetter. Albert Howarth, Providence, R. I., assignor to Star Carburetter & Supply Co., Providence, R. I., a corporation of Rhode Island. Filed Jan. 8, 1908. Serial No. 409,781.

1. In a carburetter, the combination of a tube; a throttle valve adapted to open or close at will the upper part of said tube; a concentric tube of small diameter, extending up into the first named tube from the bottom of the carburetter and having an open bottom accessible to the external atmosphere; a nozzle shorter than said second named tube and having a top which is provided with a central upwardly directed vent or opening, the latter being made with an interior conical valve seat, concentric with and continuous with said vent or opening; a needle valve having a head and whose shank near said head is screw-threaded, but is elsewhere smooth and cylindrical, which needle valve extends axially up into said nozzle and has a conical end adapted to close said valve seat and vent or opening; a fixed support having a screw-threaded hole in which the threaded part of said shank is engageable; means for supplying gasoline to said nozzle; and a cap fitting upon the said nozzle at its upper end in proximity to said vent or opening, and provided with discharging slots extending radially through the tubular sides of said cap, which are adapted to discharge gasoline spray out into the ascending air currents in the concentric space between said second named tube and said nozzle.

954,697. Spark Plug. Herbert F. Provandie, Boston, Mass., assignor of one-half to the Randall-Faichney Co., Boston, Mass., a corporation of Massachusetts. Filed May 24, 1909. Serial No. 497,866.

1. A spark plug having an insulating body, spark points, a metallic stem supporting one of the spark points and having a sight opening extending longitudinally through the body of the plug, a light-transmitting partition which prevents the passage of gases through the opening, and means for detachably securing said partition to the plug.

954,748. Differential Locking Gearing. Edwin Luckwill, Cardiff, England. Filed Oct. 28, 1909. Serial No. 525,120.

1. The combination, with a differential gearing comprising gear-wheels and pinions operatively connected together, a revoluble casing or spider supporting the said parts, and non-revoluble shafts mounted in the said pinions, said shafts and pinions being provided with opposed friction clutch-members; of cams carried by the said shafts and provided with projecting arms and adapted to operate the friction clutch-members to lock the said pinions to the said shafts, and an operating ring encircling the said differential gearing and operatively connected with the said arms.

954,785. Carburetter. Horace O. Craven, Schenectady, N. Y. Filed March 29, 1909. Serial No. 486,315.

1. In a carburetter, a cylindrical casing having an outlet, and air and hydrocarbon inlets, a tube extending diametrically across said casing, closed at one end, communicating with said hydrocarbon inlet at the other end and having openings in its wall, a cylindrical valve in said tube, and a rotary member in said casing connected to said valve and controlled by differences of pressure therein to actuate said valve.

954,844. Elastic Non-Skidding Tire Chain. Charles E. Abrams and Charles H. Mason, Chatham, N. Y. Filed Nov. 16, 1907. Serial No. 402,465.

An elastic non-skidding tire chain comprising two circumferential rim chains, composed of a plurality of elastic and inelastic links provided with eyes at their ends connected together, V-shaped links provided with eyes secured in the eyes of the inelastic links, the inelastic links of one chain being arranged opposite the elastic links of the other chain and cross chains connecting said V-shaped links in zigzag order.

954,905. Carburetter. Austin M. Wolf, New York, N. Y. Filed May 8, 1909. Serial No. 494,777.

1. A carburetter for the purpose described having a float chamber, a mixing chamber, an air inlet leading thereto, and a jacket separate from the mixing chamber and air inlet around said mixing chamber and within said float chamber.

955,053. Wheel Tire. George W. Crawford, Perth Amboy, N. J., assignor to the Safety Tire Company, a corporation of Maine. Filed Jan. 18, 1910. Serial No. 538,589.

1. In a wheel tire, the combination of a shoe and an interior spring member normally under tension, said spring member comprising a split ring which decreases in cross-section through substantial portions of the ring's length from an intermediate portion to or toward the ends, whereby the strain on the ring is distributed.

955,062. Oiling System for Engines. George W. Fairfield, U. S. Navy. Filed Dec. 26, 1908. Serial No. 469,204.

1. In an oiling system, the combination with a wrist pin bearing, and a crank pin bearing, of a hollow rod connecting the wrist pin and crank pin and having its bore in communication with said pins, an oil cup on the upper end of the connecting rod and communicating with the wrist pin, a pipe secured to the connecting rod and having its upper end connected with the oil cup, the pipe having a flared lower end extending around the lower end of the said connecting rod and adapted to be immersed in oil as the crank pin is rotated, and check valve in said pipe.

955,128. Roller Bearing. William J. Brewer, Brooklyn, N. Y., assignor to New York Oilless Bearing Co., New York, N. Y., a corporation of New York. Filed March 26, 1909. Serial No. 485,889.

1. In a roller bearing, the combination with an axle or shaft and a relatively rotatable wheel or box provided with interior annual bearing edges concentric with said shaft, of a retainer rotatably mounted in said wheel or box and comprising a pair of rings spaced apart in alignment with said bearing ledges and connected together with

cross ties, said retainer rings being provided with journal bearings having restricted openings cutting the peripheries of said rings, rollers mounted in the wheel or box and engaging the shaft, and laterally extending journal ends formed on the rollers and rotatably mounted in the journal bearings of the retainer rings for rolling engagement with the bearing ledges of the wheel or box.

955,144. Two-Stroke Cycle Internal Combustion Engine. George Enderby, Harrogate, England, assignor of one-third to Henry Johnson, Harrogate, England. Filed Oct. 21, 1909. Serial No. 523,820.

1. The combination of a working cylinder and a pump cylinder co-axial with each other, pistons in the cylinders, a hollow piston rod passing through and connecting the pistons and extending beyond the working piston, a sleeve serving as a guide for the extension of the piston rod, and a port near the end of the extension generally covered by the sleeve but opening into the working cylinder and connecting the two cylinders through the hollow piston rod when the piston nears the end of the explosion stroke.

955,188. Tire. Louis M. Nelson, Pennington, N. J., assignor to Nelson Tire Co., a corporation of Wyoming. Filed Nov. 2, 1909. Serial No. 525,912.

1. A tire comprising a resilient body portion, the tread surface of which is interrupted at intervals with relatively soft portions, the latter terminating in their uncompressed condition short of the remaining tread surface whereby to form tread depressions.

955,204. Current Controlling Mechanism for Internal Combustion Engines. Lewis T. Rhoades, Mont Clare, Pa. Filed Aug. 18, 1909. Serial No. 513,379.

1. In a device of the character described, the combination with a shaft, a disk fixed to the shaft, a contact device mounted to turn on the shaft, and having an annular series of contacts or projections, a pin or stop on the disk, a spring around the shaft secured at one end to the shaft, and at its other end to the contact device to normally hold one of the projections in engagement with the pin, and compel the contact device to turn with the shaft, means operated by said projections to close an electric circuit, and means for temporarily retarding the movement of the contact device to increase the tension of the spring, and accelerate the movement of the contact device when released from the retarding means.

955,213. Wheel Rim Securing Means. Otto R. Schoenrock, Chicago, Ill. Filed Oct. 15, 1908. Serial No. 457,948.

1. The combination with the felly of a wheel, of an outer rim, a resilient tire secured thereto, an inner rim having an out-turned edge and an inturned edge, a split ring having a groove for the reception of the inturned edge of said inner rim and having a flange adapted to engage said outer rim, a ring secured to said felly between said split ring and said felly, and a wedge for expanding said split ring, said second named ring having a portion thereof cut away to accommodate said wedge.

955,218. Carburetter. John W. Smith, Stanley, Iowa, assignor of one-half to Frank A. Sherman, Independence, Iowa. Filed May 18, 1909. Serial No. 496,779.

1. The combination of a cylinder, a carburetter connected therewith and open at

its outer end for the admission of air, an inlet valve, a stem connected with the inlet valve and passing through the carburetter, an auxiliary fuel admitting valve arranged in the carburetter and mounted on the stem, springs supported on the said stem and both houses within the carburetter for holding the valves on their respective seats, one spring being located between the valves and the other outwardly from the auxiliary valve, and means for automatically controlling the opening of the inlet valve without affecting the auxiliary valve.

955,222. Carburetter. Alfred E. Stoker, Detroit, Mich. Filed Feb. 19, 1909. Serial No. 478,913.

1. In a carburetter, the combination of a mixing chamber having a circular bore to admit air and an outlet passage, a piston valve adapted to close said bore, a coil spring to carry the weight of said valve, and an adjustable spring to regulate the travel of the valve.

955,244. Automobile Transmission Gearing. Robert E. Wynn, Brownsburg, Ind., assignor of two-sixths to Charles D. Rodenbaugh, two-sixths to James H. Kelly, and one-sixth to George Graves, Indianapolis, Ind. Filed Feb. 13, 1909. Serial No. 477,587.

1. The combination, with a driving member, of a driven member having its axis at an angle to the axis of the driving member, a driving gearing comprising a pair of aligned shafts, a differential gearing having a main body and gears connecting said shafts, a plurality of concentric gears carried by the main body of the differential gearing and axially movable thereon, means for axially shifting said concentric gears independently, and means embodied within the structure and rotating therewith to lock the shiftable gears in their different relations.

955,256. Universal Joint. Allen H. Fetzer, Galion, Ohio. Filed Nov. 10, 1908. Serial No. 461,905.

1. A device of the character described, comprising a ball and socket joint or coupling, the socket member having inwardly extending trunnion-like bearing rolls, and the ball member having elongated openings therein whose walls are tapered inwardly and also curved inwardly at the sides, said walls being curved outwardly at the ends,

and case hardened metal bushings applied and conforming to the outlines of the walls of said openings, each bushing being separate and entire from the socket member and insertible and removable therefrom.

955,286. Ball Bearing. August Riebe, Berlin, Germany, assignor to the Hess-Bright Mfg. Co., a corporation of New Jersey. Filed July 30, 1907. Serial No. 386,209.

1. A cage for ball bearings having between each two adjacent balls two independent means for separating them, one of such means consisting of a relatively soft material extending normally between each two adjacent balls a sufficient distance to hold the balls separated in use, and the other of said means constituting an emergency device adapted to hold the balls separated when the first of said means is worn out or melted.

955,292. Carburetter. Frank W. Sickles, Hartford, Conn., and Thomas D. Millea and Michael J. Carroll, Springfield, Mass., assignors to Siro-Carburetter Mfg. Co., Springfield, Mass., a body corporate of Massachusetts. Filed Aug. 17, 1908. Serial No. 448,832.

1. In a carburetter, a mixing chamber having a fluid inlet, an air inlet, and a fuel inlet, a longitudinally movable and normally non-rotary valve for said fluid inlet, a valve operating on a plane at right angles to its axis for said air inlet, a valve the plane of which coincides with its axis for said fuel outlet, and means to operate said valves simultaneously.

955,306. Anti-Skidding Device. Nathan Barnett, Chicago, Ill. Filed Jan. 20, 1909. Serial No. 473,366.

1. A vehicle tire, comprising a casing and a plurality of anti-skidding devices arranged around the tread surface thereof, each of said devices comprising a cup-shaped washer having an upstanding polysided flange, and a polysided frusto-pyramidal head inclosed by the flange, the flat edges of the bases of said heads fitting within the flanges of said washers so as to prevent the washers from turning with respect to the heads.

955,493. Automobile Lamp. Egbert E. Allen, Atlanta, Ga. Filed Nov. 13, 1909. Serial No. 527,852.

## ON INLAND SEAS Your Vacation Trip

### THE COAST LINE TO MACKINAC

## Detroit & Cleveland Nav. Co.

**A**LL the important ports on the Great Lakes reached regularly by the excellent service of the D. & C. Lake Lines. The ten large steamers of the fleet are of modern steel construction, propelled by powerful engines, and have all the qualities of speed, safety and comfort. The United Wireless Telegraph Service used aboard.

The D. & C. Lake Lines operate daily service between Detroit and Buffalo, Detroit and Cleveland, four trips per week between Toledo, Detroit, Mackinac Island and way ports, and two trips per week between Detroit, Bay City, Saginaw and way ports. About June 25, a special steamer will leave Cleveland twice a week direct for Mackinac, stopping only at Detroit every trip and Goderich, Ont., every other trip. Send two-cent stamp for illustrated pamphlet and Great Lakes map.

Rail tickets available on steamers.

Address  
**L. G. LEWIS, G. P. A.,** Detroit, Mich.  
**P. H. McMillan, Pres.**      **A. A. Schantz, Gen. Mgr.**

1. In a lamp, the combination of a body provided with guideways, number plates slipped into said guideways, a closure for the guideways having a portion cutaway, and fastening means having a part extending across the cutaway portion of said closure for retaining it and the number plates in position and exerting a yielding pressure upon the number plates to prevent rattling thereof or the formation of spaces between adjacent edges.

955,494. Vehicle Body. Samuel R. Bailey, Amesbury, Mass., assignor to S. R. Bailey & Co., Inc., Amesbury, Mass., a corporation of Massachusetts. Filed June 22, 1908. Serial No. 439,673.

1. A vehicle body comprising a longitudinal bottom iron having a vertical side portion, a vertically disposed metal side plate having its lower edge portion rigidly secured to said side portion, a sill secured to the outer side of said plate at the upper edge portion thereof, and a side secured to the outer side of said sill, substantially as described.

## SEEKS TO QUELL ALL TIRE FEARS

**A. L. A. M. Committee Issues an Optimistic Statement—Would Discourage Buying in Advance of Current Needs.**

With about a dozen of the most prominent tire makers represented at the conference, the tire committee of the Association of Licensed Automobile Manufacturers held a session on Tuesday, 24th inst., after which it issued an account of the meeting which is designed to push away the dark clouds of fear that have been hovering over the tire situation. The tire committee has been enlarged by the addition of Horace DeLisser, of the United States Motor Co., and James W. Gilson, of the Mitchell-Lewis Motor Co., and these, together with Chairman Albert L. Pope, L. H. Kittredge and S. D. Waldon, were present, as was Alfred Reeves, the general manager of the association.

"After a full discussion and consideration of the tire question as it affects the owner, dealer and automobile manufacturer," the optimistic official report of the committee's session declares, "it was decided that the situation, so far as it relates to the purchase and sale of tires, need not be so pessimistically considered as some recent reports would indicate. In fact, a more optimistic view can now be taken. The manufacturers of cars in America are not in the position where it is necessary for them at this time to contract for the next season's requirement of tires, and the rubber tire manufacturers seem to be able to handle the present situation along lines that are expected to be in favor of the car owner.

"There seems to be an impression that it is necessary for car owners to purchase tires for future use, due to the feeling that there is to be an abnormal advance on this particular product in the near future. While some increase may be expected, car owners should understand the conditions of buying now and be warned of the disadvantages

that might occur in purchasing in advance of current needs.

"There is hardly any question that the saving at the present time will be largely offset by the deterioration in surplus tires and the passing of the guarantee period. It was the opinion of the conference that the interests of all will be served by a normal attitude toward future requirements."

### Bennett Goes with Willys-Overland.

George W. Bennett, eastern manager for The White Co., has resigned that office to become sales manager of the Willys-Overland Co., Toledo, Ohio. The change will take effect June 1st. Bennett, who is aggressive and progressive to his finger tips, will be no stranger to his new duties. He was for years sales manager for T. B. Jeffery & Co. and later for the Knox company, and there is no department with which he is not intimately familiar.

### Evans to Make Wagons and Parts.

R. H. Evans has bought the plant of the Marine City Iron Works, at Marine City, Mich., which is to be used for the building of light motor delivery wagons and automobile parts. The enterprise will be known as the Evans Motor Car & Parts Mfg. Co., with Evans as secretary and treasurer. He is also secretary and treasurer of the Automobile Mfg. & Engineering Co. Both concerns will have offices in Detroit.

### Hayden Eames Retires from Studebaker.

Hayden Eames, formerly general manager of the Studebaker Automobile Co. and in charge of the Studebaker automobile interests, has retired from those duties. He is at present interested in stimulating the electric power companies, in the possibility of increased business in the supplying of current for electric vehicles.

### Death of Republic Rubber's President.

Warner Ames, president of the Republic Rubber Co., Youngstown, O., died on Wednesday, 18th inst. His death was due to angina pectoris.

## FORBES SUES FOR AN ACCOUNTING

**Brings Action Against Willys and American Motor Car Sales—Litigation Results from Old Disagreements.**

In the wake of disagreements which arose some months ago and which increased after the purchase of the Toledo Motor Co., suit has been brought by Thomas P. C. Forbes, Jr., against John N. Willys, president of the Willys-Overland Co., for an accounting, and against the American Motor Car Sales Co., of New York, for money judgment and for a receiver. The proceedings were instituted on Monday, 23d inst., in the Marion County Superior Court, at Indianapolis, Ind. Judge Vinson Carter, of the superior court, with whom the receivership suit was filed, has not yet taken action on the petition.

Paralleling the Forbes suits, a similar suit has been brought against Willys in the Federal court by Henry F. Campbell, of Indianapolis. In the former Willys is given as residing in Indianapolis, while in the latter it is assumed that he lives in Toledo, so that between the two courts the complainants are more or less sure of being right.

It has been known for some time that Forbes, who was in a sense a partner with and assistant to Willys when the latter launched on his really big career as a manufacturer, has been nursing grievances of one sort and another. These have finally come to head in the present litigation.

In his petition Forbes alleges that the American Motor Car Sales Co. was incorporated in New York in 1907, and that he owns 200 shares of common stock and 100 shares of preferred stock. It is alleged that this company contracted with the Overland company and the American Motor Car Co., of Indianapolis, to control and sell their output, and that in 1909 4,000 vehicles were sold, making more than \$400,000 of profits.

It is set out that in 1909 the stockholders

of the Sales company agreed that out of the surplus funds the Toledo company should be purchased, and that the stock of that company should be held and owned by the stockholders in proportion to their stock in the Sales company. It is alleged that the sum of \$385,000 was paid for the Toledo company, and that Willys, president of the controlling company, held the Toledo company stock in trust for the stockholders.

It is alleged that on October 26, 1909, Willys increased the capital stock of the Toledo company from \$10,000 to \$2,000,000 and changed its name to the Willys-Overland Co. The plaintiff complains that Willys has refused to issue stock of the latter company to the stockholders of the American Sales Co. in proportion to their holdings in the last named company, and that he has refused to render them an account, or to allow them to inspect the books. They aver that they have received no dividends, and that there has been no distribution of profits except in connection with the purchase of the Toledo company.

The plaintiff asks Judge Leathers to compel the defendant to render an accounting to issue stock to the stockholders and that he be enjoined from disposing of any of the stock.

In his suit against the American Motor Car Sales Co. for a receiver, Forbes alleges that on account of President Willys's management of the company it is in danger of insolvency. It is averred that Willys controls the board of directors, the other directors except himself being "dummy" directors, and that the stockholders have been denied the right to participate in the management of the company. It is alleged that in 1909 Willys paid \$65,000 to D. M. Parry for 404 shares of stock in the Overland company, that extravagant salaries have been paid to the officers of the defendant company, and that large sums of money belonging to the defendant company have been used by Willys for investments of a personal nature.

It is also alleged: "That Willys directed the bookkeeper of the defendant to credit the account of Willys with large sums of money as back salary; \$1,000 a month from September 1, 1908, and with \$150,000 a year from September 1, 1909, covering a period of time for which he had already received the regular salary allowed him by the defendant of \$1,200 a year."

The plaintiff also asks for \$5,000 of salary he alleges is due him as a sales agent for the company, and for possession of stock alleged to be due him.

President Willys on Monday night gave out the following statement:

"A little over two months ago I was offered the stock held by Messrs. Campbell and Forbes for \$2,000,000. I refused to buy it, as I considered their price far more than the stock was worth, and to show them

that I was sincere I offered to sell them my stock at that time at the same rate, which they refused to accept. While they have not received cash dividends, they have received stock dividends, being a very large percentage on the amount of their investment, on which they have had offers in cash at par.

"The charges appearing in the complaints have no foundation. When the matter is fought out the fullest investigation will be offered every stockholder as to all of my actions in the management of the several companies."

#### Brake Lining Involved in Litigation.

Seeking to restrain the administrator of the estate of the late Arthur H. Raymond from getting a patent on a brake lining supposed to have been invented by the deceased, and asking for \$10,000 damages from the Royal Equipment Co., of Bridgeport, Conn., suits have been brought by Fred L. Horton, of Lynn, Mass., in the superior court at Bridgeport. Horton claims that the patent which the administrator is endeavoring to obtain for the estate is his (Horton's) invention and not Raymond's, although it was through the latter that the Royal company arranged to have the brake lining. He also claims that the \$10,000 represents the part of the profits to which he was entitled on the brake lining and that the company already has made and sold.

#### Merger Near to Consummation.

Officials of the Dayton Motor Car Co. and of its younger brother, the Courier Car Co., both located in Dayton, O., refuse to affirm or deny that the negotiations have been completed for their merger into the United States Motor Co., according to dispatches from Cincinnati, although the president of the latter company stated that no consolidation has yet been effected. Meanwhile President Benjamin Briscoe, in a Detroit interview, declares that the United States Motor Co. is not yet through with its program of acquirement and expansion, stating specifically that "One deal in particular is practically closed, but it is not expected that the papers will be signed until early in June."

#### Veerac Secures a Factory Site.

The Veerac Motor Co., which has its general offices in Minneapolis, Minn., has obtained a factory site of five acres at Anoka, in the district between the Twin Cities. The product is to be a 20 horsepower, two-cycle, air-cooled commercial vehicle.

#### Cole Acquires Another Building.

The Cole Motor Car Co., of Indianapolis, Ind., has increased its capacity for the production of Cole "30" cars by taking over the building which formerly was occupied by the Reliable Auto Exchange, and which adjoins the company's main building on East Washington street. The annex thus

acquired has three floors and yields about 30,000 square feet additional space. It will be used exclusively for painting and final finish work.

#### Changes Among Prominent Tradesmen.

Paul H. Bruske has been made contest manager of the E-M-F. Co., of Detroit, Mich. He has been sporting editor of the Detroit Times for the past six years.

Charles A. Singer, Jr., has been made sales manager of the Palmer & Singer Mfg. Co., of New York City, and will direct the distribution of P-S cars. The New York City store management has been given to Fred J. Titus.

Mortimer Reeves, brother of Alfred Reeves, the general manager of the Association of Licensed Automobile Manufacturers, has been appointed contest manager of the United States Motor Co. He will have charge of the Maxwell, Columbia and Brush entries in competitive events.

#### Stephens and Cropley to Handle Cars.

Reorganizing its Chicago sales and distributing arrangements, the Cole Motor Car Co., of Indianapolis, Ind., has placed the handling of the Windy City trade and the Illinois agencies with a new company, which G. W. Stephens and F. S. Cropley have formed for the purpose. Stephens, who is president of the Factory Auto Supply Co., of Chicago, formerly was advertising manager for the G & J Tire Co., and Cropley was that company's Chicago representative. For the present Stephens & Cropley will continue to use the salesroom of the Standard Automobile Co., but shortly will take quarters where the Cole exclusively will be handled.

#### Kinsey Erecting a Large Addition.

The Kinsey Mfg. Co., of Toledo, O., in order to provide for a greatly increased production of hoods, radiators, fenders and fittings, is extending its plant. The extension takes the form of a three story concrete and brick building, 288x105 feet, and an "L" which is to be 75x65 feet, with three stories and a basement.

#### Federal Rubber Opens Southern Branch.

The Federal Rubber Co., of Milwaukee, Wis., has opened an exclusive branch of its own in Atlanta, Ga., located at 170 Peach-tree street. The branch will be in charge of G. M. Seewald, late of the Alexander-Seewald Co. and who for ten years previous was the Atlanta representative of Morgan & Wright.

#### Detroiters Form Company in Gaylord.

The Gaylord Motor Car Co. has been organized in Gaylord, Mich., with a capital stock of \$100,000, to make cars. Guy Hamilton, of Detroit, Mich., is the moving spirit, while Gaylord citizens have subscribed for the stock.

## TO GROUP ITS DETROIT PLANTS

**United States Motor Acquires Immense Site for New Factories—Will Have Office Building Downtown.**

Having decided upon a comprehensive "group plan" for its factories in Detroit, Mich., the United States Motor Co. has selected a site of almost 200 acres in the northern part of the city, along the main line of the Grand Trunk railway, north of Holbrook road. The merger company also has announced that it is to build a large structure at Woodward avenue and Charlotte street, for executive and departmental offices in Detroit, and where the executive, sales, publicity, financial and purchasing departments will be represented by responsible officials.

The latter building, which is to be ready in October, will have a frontage of 97 feet on Woodward avenue and 198 feet on Charlotte street, and in addition to containing the company's Detroit offices will have salesrooms and reception rooms for pleasure cars, for commercial vehicles and for Gray motors, respectively, together with a garage, stockroom and repair shop. A separate garage for the commercial vehicles will be established elsewhere.

After considering a number of sites for the "group plan," the officials of the United States Motor Co. decided on an extension of the property recently acquired by the Brush Runabout Co., which, after having bought 30 acres for its new factory, added 30 more soon after, the land now being available in conjunction with that which has been arranged for adjoining it. The grouping of the factories will bring the new plants of the Briscoe Mfg. Co., the Gray Motor Co. and the light car department of the Alden-Sampson Mfg. Co. all in the neighborhood of the new Brush factory.

### Mysterious Ad Evokes a Denial.

What is supposed to be a result of the mysterious meeting held last week in the Detroit office of the attorney for the new Association of Motor Car Manufacturers manifested itself on Sunday last in the form of large advertisements in the newspapers of various cities, proclaiming "an attempt by the automobile combination to destroy the independent automobile manufacturers of America" and concluding with a list of all the more prominent and some less prominent unlicensed makers, all of whom were made to appear as subscribers to the advertisement, thereby suggesting the possibility that the independents had combined as a solid phalanx of resistance to the Licensed Association's campaign. T. B. Jeffery & Co. was one of those whose name was given in the list at the bottom

of the advertisement, but in response to an inquiry, Jeffery & Co., who always had held aloof from both sides of the Selden situation, wired: "We have not authorized nor approved the use of our name in advertisements of any organization."

### Counselman Moves up Chalmers Ladder.

Lee Counselman, who, after being promoted from salesman, has been vice-president and assistant general manager of the Chalmers Motor Co., of Detroit, Mich., will assume the title of general manager on June 1. The latter title heretofore has been held by President Hugh Chalmers himself, but the change does not mean that Chalmers in any sense will retire from active control of the affairs of the company. He will devote his time to the larger duties of a general executive. In succeeding to Counselman's duties as assistant general manager, C. C. Hildebrand will become also a stockholder and director of the company.

### Chair Makers Turn to Automobile Tops.

The Ramsay-Alton Mfg. Co., of Portland, Mich., which heretofore has made Morris chairs, is taking up the manufacture of automobile tops, special machinery having been installed for this purpose. J. Hayes, of Detroit, Mich., has invested \$10,000 in this branch of the company's business, and large quantity production is planned.

### Engine Company Organized in Dayton.

The Mead Engine Co. has been incorporated in Dayton, O., with Cyrus G. Mead, secretary of the Citizens' Electric Co., and Adam Schanze, a millionaire brewer, among the incorporators. The company plans to build automobile engines, and declares its intention of employing 1,000 men when its factory is completed.

### Brennan Building a Big Addition.

The Brennan Mfg. Co., of Syracuse, N. Y., manufacturing motors for the automobile trade, has commenced the erection of an addition to its plant, the new building being 100 feet long and two stories high. Its purpose is to increase the company's capacity for motors of the commercial vehicle type.

### Still Enlarging the Rambler Plant.

More additions are to be made to the plant of Thomas B. Jeffery & Co., of Kenosha, Wis. Plans have been announced for a new power plant, an addition to the machine shop and a new enlargement of the motor assembling department. Other buildings will be added before fall.

### Supply House to Begin Manufacturing.

The Interstate Automobile Supply Co., of Sioux City, Ia., is going into the manufacturing end of the accessory and automobile parts business. It has started a factory and applied for membership in the local Manufacturers' Association.

## TIRE CHAIN PATENT IS UPHELD

**Weed Wins in Case Against Excelsior Supply—Parsons Patent Held "Basic to a Large Extent."**

In face of the fact that non-skid chain grips for tires are so simple in construction that a host of accessory tradesmen have been tempted to produce them for the market and a small army of patent attorneys have unequivocally declared themselves able to "break" any basic patent claims concerning such devices, the Weed Chain Tire Grip Co., of New York, after a hard fought legal battle with the Excelsior Supply Co., of Chicago, has obtained a decision broadly sustaining its patent control of the tire chain situation. While the Weed company previously has obtained favorable decisions in the courts, the case against the Excelsior company is by far the most important so far obtained, by reason of the vigor and resources with which it was fought.

The monopoly claimed by the Weed company is based on the original Parsons patent, Parsons being the English inventor who was the first commercially to develop the non-skid loose chain idea for motor cars. The complainants in the case, before the United States Circuit Court, Northern District of Illinois, Eastern Division, sitting at Chicago, are the Weed Chain Tire Grip Co., Harry D. Weed, and the Parsons Non-Skid Company, Ltd., while the defendants are the Excelsior Supply Co. and the Motor Appliances Co. The complaining company also has recently brought infringement suits against a number of other manufacturers and sellers of unlicensed chain grips, including the Whittaker, Morgan, Cleveland, Pitts, Superior, Fox and others.

Judge Sanborn's opinion in the Excelsior case, handed down on the 20th inst., is in full as follows:

Infringement suit based on the Parsons patent No. 723,299, issued March 24, 1903, for a chain-tire grip. Complainants are, respectively, assignees or interested in the patent. One of defendants sells a similar device, and the other manufactures it. The patentee's description of his invention, and two of his claims, are as follows:

It has been proposed to guard against slipping and puncturing by incorporating an anti-slipping or anti-puncturing device in the tire itself, which has the effect of slowing it considerably or causing disintegration and having other objectionable features. According to my invention I overcome these objections by providing a separate construction, giving, in effect, a non-slipping medium between the surfaces in contact, and merely suspending or engaging with the wheel, but not fixed thereto, and it is free to travel around the wheel by action of rolling contact.

The device constituting my invention consists of a network of rings or strips of metal or other suitable material or a series of small chains or bands fitting loosely over the periphery of the wheel and passing from side to side across the tire—that is, not incorporated with it—and prevented from coming off by two rings, hoops, or their equivalent, preferably of wire or other suitable material, such rings or the like, or one of them, being provided, if desired, with means of attachment and detachment, such as right and left hand screw-thread and nut, and the said rings or the like being smaller in diameter than the periphery of the wheel they cannot come off accidentally.

Anti-slipping and protecting means for the

peripheries of wheels, pulleys or the like, comprising attaching elements at opposite sides of the wheel, and an anti-slipping or protective medium secured to the attaching elements and extending across and around the periphery of the wheel said parts being disconnected from though retained on the wheel whereby the anti-slipping or protective medium is free to move or shift its position around the periphery thereof.

Anti-slipping or protective means for the peripheries of wheels, pulleys or the like, comprising two rings or annuli at opposite sides of the wheel, and an anti-slipping or protective medium consisting of a chain or chains secured to the rings and extending across and around the periphery of the wheel, said parts being disconnected from but retained on the wheel whereby the anti-slipping or protective medium is free to move or shift its position around the periphery thereof.

Advantages claimed for the device are thus stated by counsel:

The construction of the device by which it is loose on the wheel and free to travel circumferentially around it when in action gives several important results referred to in the patent. In the first place, "freedom of travel" adds very materially to the anti-slipping qualities of the device, in effect continuously laying down on the ground in front of the tire "a non-slipping medium," consisting of a series of loose cross chains, under conditions affording a maximum of traction result. In the next place, it prevents the disintegration of the rubber tire, which, as suggested in the patent, in all other proposed constructions had proved a fatal obstacle to the use of a metal traction device on a rubber tire. Again, it prevents the inevitable and objectionable "slowing" of the tire in action, which occurs where metal traction plates or similar parts are incorporated in the tire.

It is also essential in a practical device that it must be securely maintained on the tire against coming off, particularly at times of greatest strain when the machine is skidding. While the device is simple, a complicated problem is involved, which had to be comprehended by the inventor, and must be understood in order that the full scope of the invention can be comprehended. The elements of the problem are, that by all prior inventors it was supposed to be necessary to fasten the device rigidly upon the tire, or incorporate it with it, instead of being left loose or flexible. Such devices proved failures for a number of reasons. They wore out the tire by abrasion at the point of contact, "slowed" it by destroying resiliency, wore themselves out by friction, and were difficult to keep on. These objections were to a great degree overcome by the patent grip. It lessens wear by stopping the slipping, is easy to put on and take off, distributes and lessens wear of the tire by its circumferential travel, and has proved a great commercial success, superseding all other forms.

This changing of the universal idea that an anti-skid device must be securely fastened to the tire required invention, and the device described by the patentee, with such improved construction as experience and mechanical skill suggested, is fully capable of carrying out the inventive idea. There is an operative device, utility, a greatly improved result, commercial success and the supplanting of all other like devices.

It is true, and clearly disclosed by the evidence, that circumferential creeping, or what Parsons calls traveling around the wheel by action of rolling contact, was not new with him as a practical result, but he was the first to claim and fully utilize it, and understand its significance in the art. It is the inevitable law of the rolling wheel. It is even difficult to keep the tire itself from creeping forward on the rim. This tendency has been well understood since the time of the bicycle. And when an anti-slipping device is put on the tire, however firmly, it will travel around it. All other inventors, however, conceived the notion that this circumferential creeping was a detriment, and must be prevented in order to get traction and prevent slipping. Parsons was the first to understand that this motion was beneficial, that the best traction would be given by utilizing it, as well as the best form of anti-skidding. He therefore reversed the prevailing idea that this motion must be prevented as much as possible, and specified a loose grip, "merely suspended on or engaging with the wheel, but not fixed thereto . . . free to travel around it." He also contrived a novel means of carrying his idea into practical application; that is, by a loose grip, held upon the tire by side-members of sufficiently less diameter than the tire to securely retain the device in place. Neither of these things had been done before. This is not an attempt to patent a function, result, idea or abstraction, but a new conception and new embodiment of that conception, producing an improved result, useful in itself, and commercially successful. It is entitled to liberal treatment, both as to anticipation and infringement.

To the objection that the claims are functional, it may be said that claims for means for, or mechanism adapted to a certain result, and like functional claims, are not objectionable if limited to the invention shown by the specification and drawings. So narrowed, they are valid. (*Hobbs v. Beach*, 180 U. S. 383, 21 Sup. Ct. 409, 45 L. Ed. 586; *Paper Bag Case*, 210 U. S. 405, 28 Sup. Ct. 748, 52 L. Ed.,

1122.) Moreover, some of the claims, like the last one quoted, read directly on the illustrated construction.

Another objection, that the disclosure is not complete, may be answered by saying that no one has found any difficulty in building the devices, nor is it thought that even a workman unskilled in the art, after reading the patent, could not properly construct it. Even functions not specified, where means to secure them are claimed, but not fully explained, have not been so construed as to avoid the patent. In the rubber tire wheel cases, the important side tipping function, all there was to distinguish the prior art, was not clearly claimed, nor was the proper tension on the securing wires, by which such function was secured, even suggested, but the patent was sustained everywhere except in the Sixth Circuit. (*Consolidated Tire Co. v. Fire Proof Tire Co.*, 151 Fed., 237, 80 C. C. A. 589; *Rubber Tire Wheel Co. v. Milwaukee, etc., Co.*, 154 Fed. Rep., 358.) This was for the reason that the side-tipping function of the tire was universally found on the wheels built by workmen everywhere.
